Methods: Interview with both parents, during which they are asked questions about themselves and all members of immediate family group, regardless of age; a brief interview with each of the two oldest siblings, during which the same questions, where applicable, are asked of them. These interviews are supplemented with history material obtained in the course of the Family Rorschach project, plus observation of the Joint Family Rorschach interviews. Each parent is asked to prepare a Social History Form R, to facilitate possible, more limited comparisons with families on these projects at some future date. In addition, parents are asked to assess the health of each of their children on a separate but similar form. Summary evaluation of each family is prepared after a careful review of transcribed interviews and other material to form the basis for further study.
Duration: Not reported-1967.
Investigator(s): Carol F. Hoover, M.S.S.W., Social Service Department, Clinical Research Center, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda, Md. 20014.

19-LJ-6 PARENTAL CHILD-REARING ATTITUDES AND CHILDREN'S PERCEPTION OF PARENTAL ROLE

Purpose: To investigate parent-child relationships as seen from the point of view of both the parents and children involved.
Subjects: Children between the ages of 5 and 12 who have been referred to the Children's Clinic of the Institute of Living for psychiatric evaluation.

A group of normal grade school children will also be studied. Efforts will be made to contact both the mothers and fathers of all children seen.
Methods: Parental attitudes toward child rearing will be studied using a modified version of the Torgoff Parental Developmental Timetable. Children's perceptions of their mothers and fathers will be investigated by using several techniques, involving a questionnaire procedure and a picture description technique, developed by Kagan and Lemkin.
Duration: June 1965-June 1967.
Investigator(s): Wayne A. Owen, Ph.D., Staff Psychologist; Marvin Reznikoff, Ph.D., Chief Psychologist; and David Hill, Ph.D., Staff Psychologist, Institute of Living, 200 Retreat Ave., Hartford, Conn. 06102.
Publication: To be submitted to Child Development.

19-LJ-7 CHANGES IN THE COMMUNICATION PROCESS DURING FAMILY THERAPY

Purpose: To clarify relationship between communication break-down and family ill-health and the reinstitution of better communication as a result of family therapy.
Subjects: Consecutive family therapy cases assigned to investigator from the clinic of the Psychology Department at UCLA.
Methods: Intensive analysis of verbal interactions using interaction categories: Informational, Emotional, and Relational. Independent raters achieve moderate reliabilities. Recordings and typescripts are used concurrently.
Findings: Pilot results (one family): Informational and emotional aspects of communication decrease in family therapy; Relational changes depend on particular dyad; no generalization is safe. Each dyad must be considered separately.
Duration: September 1963-unknown.
Investigator(s): Walter J. Raine, Ph.D., Clinical Psychologist, and Assistant Professor in Residence, Neuropsychiatric Institute, University of California at Los Angeles, Los Angeles 24, Calif.
Publication: To be submitted to Family Process.

Child rearing

19-MA-1 MATERNAL CHILD-REARING ATTITUDES RELATED TO NEUROLOGICAL ADEQUACY, EEG NORMALITY, AND INTELLECTUAL FUNCTIONING IN INFANTS

Purpose: To study the relationships between neurological and electroencephalographic functions in children predisposed to develop organic brain dysfunctions as a result of birth conditions and maternal child-rearing attitudes.
Subjects: 20 randomly selected premature infants who survived for one month after birth.
Methods: Mothers were given the Parental Attitude Research Instrument to complete, usually within the first month after child's birth. Neurological, intellectual, developmental, perceptual, and perceptual-motor tasks were administered one week after child's discharge from hospital, at seven months, and at 13 months. Electroencephalograms were taken at 13 months. Interviews were also obtained at each visit.
Findings: The attitude of the mother toward child-rearing practices is the predominant determinant of degree of neurological adequacy and EEG normality, as well as intellectual functioning at 13 months, more than any physical,

developmental, or birth variable.
Duration: January 1964-July 1965.
Investigator(s): Jack Arbit, Ph.D., Assistant Professor; and George K. Yacorzynski, Ph.D., Professor of Psychology, Medical School, Northwestern University, Chicago 11, Ill.
Cooperating group(s): Michael Reese Hospital; Illinois State Department of Mental Health.
Publication: Will publish several reports in appropriate psychological or neurological journals. Also will present report this fall to the Chicago Neurological Society.

19-MD-1 MORAL DEVELOPMENT OF CHILDREN AND ITS RELATION TO PARENTAL ATTITUDES OF INDEPENDENCE GRANTING AND ACHIEVEMENT INDUCEMENT

Purpose: To determine if these two dimensions of parental control have any relation to the conscience orientation of the child.
Subjects: 300 sixth-grade public school children in two school districts of Utah.
Methods: The moral orientation of the child will be measured by means of a battery of instruments adapted from those developed by Dr. Martin Hoffman, which includes projective, open-ended, and objective items, requiring the children to make moral judgments about law violations that are committed under different conditions. The parents will be measured on an adapted form of the Parental-Developmental Time-Table developed by Dr. Irving Torgoff.
Duration: March 1963-August 1965.
Investigator(s): Henry E. Draper (Ph.D. Candidate), Assistant Professor, Department of Human Development and Family Relations, Brigham Young University, Provo, Utah.

19-MD-2 INFANT FEEDING AND WEANING PRACTICE

Purpose: To ascertain: how mothers feed their children in regard to their socio-economic levels; what age the babies are weaned; and what kind of food are supplemented to them.
Subjects: Mothers and their children in Huay Kwang Government Housing Project, Bangkok.
Methods: By interviewing those mothers in the mentioned area.
Duration: November 1964-1965.
Investigator(s): Srisomang Keovichit, M.D., M.P.H., M.S., Lecturer, Faculty of Public Health, University of Medical Sciences, Bangkok, Thailand.
Cooperating group(s): Department of Nutrition and Department of Biostatistics, University of Medical Sciences.

19-MD-3 A STUDY OF CHILD-REARING PRACTICES AMONG CHINESE-AMERICANS AS RELATED TO JUVENILE DELINQUENCY

Purpose: It is hypothesized that the relative absence of delinquency among the young Chinese-Americans is the result of differences in child-rearing pratices and the family structure of the Chinese as compared to other ethnic groups. The purpose of this research is to uncover these differences.
Subjects: Chinese-American mothers with children, or a child, between the ages of 5 and 8, in Chinatown, N. Y.

BEST COPY AVAILABLE

Methods: Intensive interviews with the mothers using the Sears, Maccoby, Levin interview schedule.
Duration: June 1965-May 1966.
Investigator(s): Richard T. Sollenberger, Ph.D., Professor of Psychology, Mount Holyoke College, South Hadley, Mass.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-MD-4 MEASUREMENT OF DIFFERENCES IN APPROACHES TO REARING OF PRESCHOOL CHILDREN

Purpose: To develop a method by which the child-rearing approach of one parent can be compared with the child-rearing approach of another in terms of: overall pattern of parent-child interaction; deviation from a predefined "optimum" approach; and the "Traditional Family Ideology" Score.
Subjects: 100 volunteer (middle class) mothers of four-year old children.
Methods: Semi-structured interview, and Traditional Family Ideology Questionnaire; Mothers are asked to describe in detail their usual handling of 38 behavioral situations that commonly arise in rearing four-year old children. Rating scales will be constructed for each situation with a predefined "optimum" of parental handling. The mother's overall approach will be determined by the sum total of her deviation from the defined standard of "optimum," by the pattern this deviation takes (Autocratic, Overprotective, etc.), and her score on the "Traditional Family Ideology" Scale.
Duration: June 1965-June 1967.
Investigator(s): Robert W. Chamberlin, Jr., M.D., Assistant Professor of Pediatrics, University of Kentucky Medical Center, Lexington, Ky.
Cooperating group(s): Foundation's Fund for Research in Psychiatry.
Publication: Clinical Pediatrics 4:150-159, 1965.

19-MD-5 CAUSES OF PARENTAL BEHAVIOR

Purpose: To investigate the influences on child-rearing practices as perceived by parents.
Subjects: 39 mothers and 39 fathers in intact families.
Methods: Data collected through interviews with parents; influences coded and analyzed statistically.
Findings: Causes include values, beliefs (both instrumental and descriptive), characteristics and behavior of family members, behavior settings, past experiences, and communication sources. The relation of these to seven demographic variables are reported. Inter-relations examined.
Duration: June 1957-September 1965.
Investigator(s): Lois Meek Stolz, Ph.D., Emeritus Professor of Psychology, Stanford University, Stanford, Calif.
Cooperating group(s): Laboratory of Human Development, Stanford University; National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

SOCIAL, ECONOMIC, AND CULTURAL INFLUENCES

19-NA-1 A STUDY OF AMERICAN YOUTH CULTURE

Purpose: To ascertain through the use of ethnographic methods of investigation the characteristics of youth culture in our society.
Subjects: Six male and six female youth groups, 16 to 20 years of age, representative of the major social class, ethnic, racial, and religious categories of the population, as well as of major locations within the local adolescent status system.
Methods: Analysis of the records of participant observation by a staff of field workers trained in methods of enthnographic study, with each worker assigned to a single group for a 9 to 12 month period.
Duration: October 1964-1968.
Investigator(s): Solomon Kobrin, M.A., Chief, Division of Social Systems Analysis, Institute for Juvenile Research, 907 S. Wolcott St., Chicago 12, Ill. (Reported by Noel Jenkin, Ph.D., Director of Research, Institute for Juvenile Research.)
Publication: Journal articles and monograph are planned.

19-NA-2 AN INVESTIGATION OF TIME PERSPECTIVE AND ITS APPLICABILITY TO CROSS-CULTURAL COMPARISONS

Purpose: To delineate some dimensions of time perspective and develop operational measures of these; to investigate the functional relationships among these variables; and to determine the heuristic value of these variables in cross-cultural and developmental comparisons.
Subjects: Spanish-American, Anglo-American, and American Indian children in three school systems and two age groups (10 and 16).
Methods: A multi-variate analysis of several dimensions of time perspective by race, age, and content, derived from a story-telling task.
Findings: There are many significant and complex relationships among the variables and dimensions studied.
Duration: June 1963-June 1965.
Investigator(s): Alan H. Roberts, Ph.D., Assistant Professor of Psychology, University of Colorado Medical School, Denver, Colo. 80220; and Joel E. Greene, Ph.D., Professor of Psychology, New Mexico Highlands University, Las Vegas, New Mex.
Cooperating group(s): National Science Foundation.
Publication: Final report in preparation, to be followed by publication.

19-NA-3 A COMPARATIVE STUDY OF DREAMS

Subjects: Six Cuna Moon-Child albino boys and brown-skinned controls paired for age and sex.
Methods: Examinations covered skeleton, skin, hair, cutaneous cancer, ears, teeth, eyes, voices, routine laboratory and special tests, heart, intelli-

gence, and psychiatric condition. Their dreams will tell much about differences in attitudes between Moon-Children and their brown controls. Dreams loom large in the Cuna culture, and everybody will tell his dreams, eager for an interpretation. The Moon-Child dreams collected will be compared intra-tribally and with dreams of other primitive cultures. The findings should provide a basis for developing psychotherapeutic measures suited to Moon-Child mental problems.
Findings: Differences were found between albinos and controls for body size, skull shape, nose, ears, hair, skin, shape of eyeball, voice, strength, and metabolism. They were found to suffer from corneal astigmatism and lateral nystagmus. Moon-Children lead an abnormal mental life and are largely rejected by the opposite sex.
Investigator(s): Clyde E. Keeler, Sc.D., Research Associate; Calvin S. Hall, Ph.D., Director; and Robert L. Van de Castle, Ph.D., Associate Director, Institute of Dream Research, Inc., 3525 Crystal View Ct., Miami, Fla. 33133.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-NA-4 LIFE OF THE LOWER CLASSES (TRANSLATED FROM SPANISH)

Purpose: To define and learn about their way of life in Mexico; to show the hazard to children of working, wandering, or begging in the street.
Subjects: Fathers, mothers, and children, including even the youngest.
Duration: February 1964-1966.
Investigator(s): Dr. Hector Solis Quiroga, Chief, Department of Social Integration, National Institute for the Protection of Children, Emiliano Zapata No. 340, Mexico 13, D. F.

19-NA-5 THE DIFFERENTIATION OF VALUES IN RURAL SOCIETY

Purpose: To discover how selected values and attitudes are differentiated for families of varying backgrounds and individuals with different characteristics.
Subjects: A sample of rural youth.
Methods: Subjects will be surveyed by questionnaire technique to ascertain their degree of social conservatism and the correlation of this to various facets of their behavior. These youth will be contrasted primarily with baseline data obtained for a comparable rural youth group in 1947. Adult samples taken from a highly urbanized area, an interstitial rural-urban fringe, and a predominantly agricultural area will also be used to note possible differences in values currently which are associated with place of residence. Values to be scaled are built around social conservatism and its implications.
Investigator(s): R. C. Bealer, Ph.D., Assistant Professor of Rural Sociology, Agricultural Experiment Station, Pennsylvania State University, University Park, Pa.
Cooperating group(s): State of Pennsylvania.

19-NA-6 CHILDREN'S KNOWLEDGE OF OCCUPATIONAL ROLES AND OCCUPATIONAL PRESTIGE RANKINGS

Purpose: To determine relative influence of learning sources, role of personal and social characteristics, family background, residence, and

patterns of television usage on occupational learning.
Subjects: 237 urban and rural children from the school system of a small midwestern city, and their parents.
Methods: Subjects were interviewed concerning their knowledge of selected occupational roles, and their understanding of prestige hierarchies among occupations. Special instruments and techniques were used to assess this knowledge and to maintain interest and attention. The sources from which children acquire their understanding of the world of work were also studied. The occupations used, and the measuring instruments employed, were designed so as to permit comparison of the following learning sources from which a child can gain ideas about occupations: personal contact, television, and general community culture. Information was gathered on parental values, aspirations and expectations from their children, social class level, parental conceptions of occupational prestige systems, family television habits, and many other variables.
Investigator(s): Melvin L. DeFleur, Ph.D., Professor of Sociology, University of Kentucky, Lexington, Ky.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-NA-7 AGE AT MARRIAGE AND RELATED VARIABLES

Purpose: To re-examine independent variables related to age at marriage; to determine importance of age at marriage in educational achievement; to assess relationship of age at marriage to entry into various categories of occupations; to study relationship of age at marriage to marital stability; and to develop a conceptual frame of reference for research in early marriage.
Subjects: A cross-section of rural and urban youth at beginning of ninth grade.
Methods: Comprehensive data would be collected on subjects on three occasions: in ninth grade, as near high school graduation as possible, and approximately four years later near college graduation. Such data would include social, psychological, and educational data believed relevant both to age at marriage and to educational and occupational achievement and marital stability. Such data would constitute "benchmark" data of the study which would allow matching of those marrying early, later, and not at all.
Investigator(s): F. Ivan Nye, Ph.D., Professor of Sociology, Agricultural Experiment Station, Washington State University, Pullman, Wash.
Cooperating group(s): Cooperative State Experiment Station Service, U. S. Department of Agriculture.

19-NA-8 EFFECTS OF STRUCTURAL VARIABLES ON FEMALE BEHAVIOR

Purpose: To analyze individual and interactive effects of community type, socio-economic position, and race on behavior and attitudes of teenage girls.
Subjects: 534 high school girls between ages of 15.5 and 17.5.
Methods: Data collected from questionnaire administered to groups. Statistical tests utilized are Kolmogorov-Smirnov test of cumulative percentage differences and complex analysis of variance with 3-way interaction.
Duration: September 1963-March 1965.
Investigator(s): Jean W. Butman, Ph.D., Study Director, Institute for Social Research, and Henry J. Meyer, Ph.D., Professor of Social Work and Sociology, School of Social Work, University of Michigan, Ann Arbor, Mich.
Cooperating group(s): National Institute of Mental Health, Public Health

Service, U. S. Department of Health, Education, and Welfare.
Publication: Final report in process. Publication uncertain, possible in sociology journal.

19-NA-9 STUDENTS, TEACHERS, AND OPPORTUNITY PERCEPTION IN KENYA

Purpose: To delineate social background of secondary pupils together with their vocational aspirations and expectations; to characterize the teaching force in terms of social background, educational and vocational experience, and viewpoints on educational policy. General aim is to analyze main features of secondary schools in a developing country.
Subjects: Approximately 2000 pupils and 1200 teachers from various types of secondary schools. School system is tripartite, including African, Asian, and European members.
Methods: Pupils and teachers complete schedules giving detailed social and educational data, together with expressions of aspirations, expectations, and viewpoints. Ethnic and area subdivisions of sample are used. Statistical analysis is essentially simple tabulation. Materials are supplemented by voluminous historical and other data on the system.
Duration: May 1964-September 1965.
Investigator(s): C. Arnold Anderson, Ph.D., Professor of Education, University of Chicago, Chicago 37, Ill.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

19-NA-10 PATTERNS OF ADJUSTMENT AMONG YOUTHS IN CONTEMPORARY SOCIETY: A COMPARATIVE ANALYSIS

Purpose: To provide an understanding of background and orientations of youth and their parents and how these factors affect and are affected by a rapidly changing and urbanizing society; and to provide general knowledge about problems of youth and generic process of youth adjustment in context of a constantly changing urban as well as rural setting.
Subjects: Samples of youths and their parents in Hawaii and the Philippines.
Methods: Rural-urban distinction and stratification indices (socio-economic and ethnic variables) will be utilized as primary classifying variables. Investigation will focus on indicators of behavior orientations of youth, norms and values of youth and their parents, self-perception of youth, parental perception of status-role of youth, and structural functional organization of family.
Investigator(s): Douglas Yamamura, Ph.D., Professor of Sociology, and George Won, Ph.D., Assistant Professor of Sociology, University of Hawaii, Honolulu 14, Hawaii.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-NA-11 CROSS-CULTURAL STUDIES OF PATTERNS OF COGNITIVE ABILITIES IN CHILDREN, AND THE RELATION OF THESE TO FACTORS IN THE CHILDREN'S HOME BACKGROUND AND EDUCATION

Purpose: It is hypothesized that not merely the overall scores (from tests of intellectual factors) but the patterns of mental development along different lines will vary with conditions of upbringing, and that this

research will help to reveal those conditions which chiefly handicap the production of able individuals in underdeveloped territories.
Subjects: Samples of children, ages 11 to 12, in societies where English is the main medium of instruction (though with the aid of local students where the mother-tongue is a Creole, dialect, or other language).
Methods: Subjects will be individually tested, covering briefly a fair range of intellectual factors as well as concept development. Background factors will be assessed mainly by interviewing teachers and children, and will include health and nutritional conditions, standards of living, educational status and aspirations of parents, family patterns and stability, values in child rearing, encouragement of independence, linguistic situation, and length and quality of schooling.
Duration: 1964-1968.
Investigator(s): Philip E. Vernon, Professor of Educational Psychology, Institute of Education, University of London, London; and Dorothy A. F. Vernon, M.A., Remedial Teacher and Educational Psychologist, Hertfordshire County Council, England.
Cooperating group(s): Association for the Aid of Crippled Children.

19-NA-12 SOCIALIZATION AND THE LEBANESE EXTENDED FAMILY

Purpose: A cross-cultural investigation of socialization practices--especially as these relate to learning of sex roles--in a society in which both extended family and peer group are heavily implicated in socialization of the child.
Subjects: 600 people, inhabitants of a small Muslim community situated in central Bekaa valley of Lebanon.
Methods: Standard ethnographic techniques of flexible informant interviews and participant observations will be combined with more structured questionnaires and focused observations of a selected sample of children and their parents.
Duration: December 1963-December 1965.
Investigator(s): John A. Clausen, Ph.D., Director, Institute of Human Development, and Judith R. Williams, Assistant Specialist II, University of California, Berkeley 4, Calif.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-NA-13 SOCIAL FUNCTIONS OF THE TURKISH *LISE*

Purpose: To assess role of the *lise*, a secondary school centrally located in the power structure of the society, in the socio-political modernization of Turkey; to determine following characteristics of the students in the *lise*: patterns of recruitment and selection, educational and vocational aspirations and expectations, perceptions of the occupational structure, and values and attitudes concerning themselves as active agents in bringing about change.
Subjects: Approximately 6,000 students drawn from the four types of *lise*: public, private Turkish, foreign-operated, and minority.
Methods: A questionnaire was administered to a sample of subjects. Responses to over 100 items were solicited on socio-economic and educational background of parents; parental occupational and geographical mobility; types of occupations and level of education students wish to have, what they actually expect to get, and reasons for any imbalances between aspirations and expectations; prestige ranking of various occupations and reasons for such ranking; and extent to which students have accepted cultural and

educational modernization.
Investigator(s): Andreas M. Kazamias, School of Education, University of Wisconsin, Madison, Wis.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

19-ND-1 VOCATIONAL STATUS OF YOUTH NOT GOING TO COLLEGE

Purpose: To determine what aptitudes, skills, and social-personal factors best fit youth for technical and artisan occupations and training needed for these occupations.
Subjects: High school juniors and seniors in a rural area.
Methods: A battery of appropriate tests will be given to subjects. This will be supplemented by environmental data. Correlations and measures of significance of the characteristics of rural youth not planning to go to college will be made to show types of training needed to best fit rural youth for occupations for which tests indicate they are best fitted. Use will be made of tests already given and data available through the Illinois High School Testing Program; these data will be supplemented by visits to schools included in sample. Statistical calculations will be made on IBM equipment.
Duration: July 1963-July 1966.
Investigator(s): D. E. Lindstrom, Ph.D., Professor of Rural Sociology, Department of Agricultural Economics, Agricultural Experiment Station, University of Illinois, Urbana, Ill.
Cooperating group(s): Cooperative State Experiment Station Service, U. S. Department of Agriculture.

19-ND-2 EDUCATIONAL AND OCCUPATIONAL ASPIRATIONS OF HIGH SCHOOL STUDENTS IN NORTH CAROLINA

Purpose: To determine educational and occupational aspirations held; to determine existent differences between educational and occupational aspirations and actual plans; to determine sources of educational and occupational aspirations; to test for relationships between educational and occupational aspirations and certain personal and social variables, such as intelligence, residence, social class, school curriculum, plans for marriage, intention to migrate, and parental attitude; and to compare educational and occupational aspirations of these students with findings reported in similar studies completed elsewhere.
Methods: Data obtained from seniors in 23 high schools located in nonmetropolitan economic areas; and additional information obtained from school records relating to class rank and I.Q. scores. Data are processed through Computing Center and analyzed with appropriate statistical techniques.
Investigator(s): Lawrence W. Drabick, Department of Agricultural Education, North Carolina State of the University of North Carolina at Raleigh, Raleigh, N. C.
Cooperating group(s): State of North Carolina.

19-NG-1 CIVIC ATTITUDES OF JAMAICAN HIGH SCHOOL STUDENTS

Purpose: To inquire into nature of socialization process among pre-adult

Jamaicans to learn how their civic orientations and identifications are developed, and role of selected social institutions such as school and various family structures in this process; to better understand how the civic socialization process contributes to stability of a democratic political system in Jamaica; and to identify some factors within the social system which explain change of civic orientations and identifications among pre-adult Jamaicans.
Subjects: A stratified random sample of approximately 700 Jamaican high school students and a subsample of 300 families of students.
Methods: Survey interview and questionnaire methods will be used to collect data from subjects. Major independent variables are family and family structure, peer group, and school. Some major dependent variables are authoritarian vs. democratic attitudes, feelings of civic inefficacy, political involvement, partisan identifications, developmental rate of civic orientations, and development of orientations toward the civic order. Data will be processed by IBM methods and a statistical analysis of data will be carried out.
Duration: December 1963-June 1965.
Investigator(s): Kenneth P. Langton, M.A., Ford Fellow, Department of Political Science, University of Oregon, Eugene, Oreg.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

19-NG-2 CHILDREN'S REACTIONS TO PRESIDENT KENNEDY'S ASSASSINATION

Purpose: This analysis of children's political and emotional reactions in times of crisis inquires into attitudes and justice, morality, and American politics. The goal is to contribute to the literature of political socialization.
Subjects: 1400 greater Detroit school children in grades 4, 6, 8, 10, and 12.
Methods: Paper and pencil questionnaire.
Duration: December 1963-December 1965.
Investigator(s): Roberta S. Sigel, Ph.D., Associate Professor of Political Science, Wayne State University; and Irving E. Sigel, Ph.D., Chairman of Research, Merrill-Palmer Institute, Detroit, Mich.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Chapter in forthcoming volume by Martha Wolfenstein and Gilbert Kliman, eds., Children and the Death of a President (Doubleday and Company). Chapter in forthcoming volume by Greenberg and Parker, eds., The Kennedy Assassination and the American Public (Stanford University Press).

19-NM-1 CHILDREN'S REACTIONS TO ILLUSTRATIONS PORTRAYING MULTI-ETHNIC GROUPS

Purpose: To note whether or not children notice racial differences among characters in illustrations, and to determine children's reactions to the illustrations.
Subjects: 90 students from different socio-economic areas and three grade levels (kindergarten and grades two and four in an all-white upper-middle class school, an all-Negro lower class school, and an integrated middle class school).
Methods: Interview with each child in which he was presented with stories and illustrations portraying integrated situations. A structured questionnaire was used to ask subjects specific questions about the illustrations and stories.

Duration: May 1965-unknown.
Investigator(s): Samuel Weintraub, Ed.D., Assistant Professor of Education, University of Chicago, Chicago, Ill. 60637.
Cooperating group(s): Reading Research Center, University of Chicago.
Publication: Will be submitted for publication.

19-NM-2 RELIGIOUS ATTITUDES OF 40 INSTITUTIONALIZED PROTESTANT GIRLS WITH IMPLICATIONS FOR CHRISTIAN EDUCATION: A COMPARATIVE STUDY

Purpose: To determine whether significant differences exist between religious attitudes of a group of institutionalized Protestant girls and those of noninstitutionalized girls, and what implications, if any, these differences have for development of a program of Christian Education for institutionalized girls.
Subjects: 40 girls from Long Lane School, a state school for legal custody of girls who have manifested habitual antisocial behavior; and a control group of girls from local churches, approximately matched with Long Lane girls for socio-economic and educational background.
Methods: Responses to questions of three inventories (An Inventory of Religious Attitudes, Revised Form II, Attitude Inventory and Rosenberg Self-Esteem Questionnaire Study) were analyzed, with aid of IBM processing, using Chi-square test for significance. Results are presented, and suggestions made as to reason for some differences that appear.
Findings: Significant differences in religious attitudes do exist between two groups tested as well as between Negro and white respondents. Attitudes of institutionalized girls appear to be more like those of girls from Negro churches than like those girls from white churches. In development of Christian Education program at Long Lane, the educator will not be able to generalize from his experiences in local church although he may find his experiences with the Negro church to be helpful.
Investigator(s): George H. Sinclair, Jr., Ed.R.D., Pastor, First Baptist Church, 93 Main St., Middletown, Conn.

EDUCATIONAL FACTORS AND SERVICES

General

19-OA-1 ABSENCE FROM SCHOOL: NORMS BY SEX AND GRADE

Purpose: To develop percentile norms for "number of days absent per year" for boys and girls from kindergarten to grade 12.
Subjects: All of the nearly 2000 children enrolled in all of the junior and senior high schools of the four independent school districts of Itasca county.
Methods: All attendance data were transferred to IBM cards for tabulation and analysis.
Findings: Clearly demarcated changes in "number of days absent per year" are observed over the kindergarten - 12 range. These changes are similar in all four districts and appear in the data from both boys and girls. Boys are better attenders than girls. Percentile norms are presented.
Duration: 1964-1965.
Investigator(s): Richard G. Stennett, Ph.D., Northland Social Science Research Program, Grand Rapids, Minn.
Cooperating group(s): Minnesota Association for Mental Health; C. K. Blandin Foundation; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Submitted for publication to the Journal of Educational Research.

19-OD-1 EDUCATIONAL ASPIRATIONS OF CANADIAN HIGH SCHOOL GIRLS

Purpose: To evaluate relative influence of high school and community on college plans, and intermediary variables (ability and values).
Subjects: Stratified cluster sample of high schools of Western Canada (Ontario included). All girls in the final year preceding junior matriculation were examined.
Methods: Questionnaire to all subjects; additional data from high school administrations and census material.
Findings: Both high school (in terms of proportion of middle class students) and community (in terms of size) show direct relation to frequency of college planning. When high school is controlled, relation for community size disappeared. When community size is controlled, relation for high school occurs only, but strongly, in large cities. Ability (scores on standardized exams) was an important explanation for effect of high school. Value items showed no explanatory power.
Duration: January 1962-spring 1965.
Investigator(s): Richard P. Boyle, Ph.D., Assistant Professor of Sociology, University of Iowa, Iowa City, Iowa.
Cooperating group(s): Royal Commission on Health Services, Canada.
Publication: Ph.D. dissertation, University of Washington, 1964. Manuscripts for journal publication in preparation.

19-OG-1 A LONGITUDINAL STUDY OF THE EFFECTS OF THE HALF-DAY SESSION IN ELEMENTARY SCHOOLS

Purpose: To examine relationships between number of years a child has attended school on half-day or split-sessions and certain other variables related to successful completion of a school program.
Subjects: Pupils in grades 9, 10, 11, and 12 in a county school system operating on split-session schedules.
Methods: Subjects responded to a questionnaire designed to yield information: (1) regarding successful school experience; (2) of a biographical nature; and (3) concerning aspirations. Information was also available to determine number of years each child had attended school on a half-day schedule.
Duration: May 1964-December 1965.
Investigator(s): Russell P. Kropp, Ed.D., Director, Institute of Human Learning, and Howard W. Stoker, Ph.D., Associate Professor, Educational Research and Testing, Florida State University, Tallahassee, Fla.
Publication: Journal article planned.

19-OG-2 SCHOOL INTEGRATION PROCESSES: DEVELOPMENT EVALUATION

Purpose: To implement and evaluate methods for effective integration of culturally deprived, Negro, elementary and junior high school pupils into presently all-white or nearly all-white public schools.
Methods: Outside facilitators of change will work with principals, teachers, pupils, and neighborhood groups including parents to promote development of positive attitudes and behavior, comfortable interracial interaction, and optimal educational environment in schools. Comparison schools, which will not be offered special services, will be used in evaluation of effectiveness of "change agent" teams. Although a variety of "objective" measures will be used, evaluation program will emphasize techniques of structured and unstructured participant observation and interviewing.
Duration: 1964-1966.
Investigator(s): Irwin Deutscher, Ph.D., Director of Research; Mario D. Fantini; Jerome Beker, Ed.D.; and Gerald Weinstein, Youth Development Center, Syracuse University, Syracuse, N. Y. 13210.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

Achievement, aptitude, and school adjustment

19-OM-1 AN EXPLORATORY STUDY OF THE EFFECTS OF BIBLIOTHERAPY ON BEHAVIORAL PATTERNS OF ADOLESCENTS

Purpose: To determine whether there will be a significant difference in changes in behavioral patterns in the areas of personality, problem reduction, achievement, truancy, and disciplinary problems between students who receive bibliotherapy and students who do not.
Subjects: Eight classes of eighth and ninth grade students selected from a large urban area in Kansas have been equated and four have been randomly selected as experimental group and four as control group.
Methods: Teachers of experimental groups will be trained in techniques of bibliotherapy. Both sets of groups will be subjected to diagnostic devices

designed to reveal social and academic problems. Selected readings with possible therapeutic value will be prescribed for students of experimental groups, who, as indicated by diagnostic measures, have social or academic problems. Pre- and post-tests of IPAT, Mooney Problems Checklist, SRA Achievement Series, Haggerty-Olson-Wickman Behavior Rating Schedule, and teacher-devised inventories will be administered to determine change.

Duration: Not reported-August 1965.

Investigator(s): J. T. Sandefur, Ed.D., Chairman, Department of Secondary Education, and Jeanette Bigge, M.A., Associate Professor of Education, Kansas State Teachers College, Emporia, Kans. 66801.

Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

19-OM-2 AN INVESTIGATION OF THE RELATIONSHIP BETWEEN SEPARATION BY SEX OF EIGHTH GRADE BOYS AND GIRLS AND ENGLISH ACHIEVEMENT AND SELF-CONCEPT

Purpose: To determine whether boys and girls in sex-segregated classes achieved at higher levels in English and held better views of themselves (self-concepts) than did pupils in mixed classes.

Subjects: 199 subjects were selected from a junior high school seventh grade. These were divided into two all-boy and two all-girl experimental groups and two control groups containing both boys and girls.

Methods: A male English teacher and a female social studies teacher taught experimental all-boys' and all-girls' classes and control class. A female English teacher and a male social studies teacher also taught one each of the experimental groups and a control group. Two basic kinds of comparisons were made. Boys in each of the experimental classes were compared with boys in their respective control classes on measures of English achievement and self-concept. Similarly, girls in experimental and control groups were compared. All classes were given the California Achievement Tests as well as three measures of self-concept, at beginning and end of school year. Teacher classroom logs were utilized to determine teacher attitude toward classes and extent to which instruction was varied according to sex of class taught.

Findings: Findings indicate that there is not conclusive evidence that pupils learn English better in segregated classes or that their self-concepts were enhanced over those of pupils in mixed classes. In fact, it appears that pupils in mixed classes achieved slightly higher in English on an overall basis. Some boys and girls in experimental groups had a significantly better view of themselves as problem solvers as contrasted with their control groups than they did at beginning of experiment.

Duration: Spring 1962-fall 1964.

Investigator(s): Walter B. Waetjen, Ed.D., Professor of Education; Jean D. Grambs, Ed.D.; and John K. Fisher, Staff Associate, Bureau of Educational Research and Field Services, College of Education, University of Maryland, College Park, Md. 20742.

19-OM-3 MONTESSORI PRESCHOOL EDUCATION

Purpose: To find a more effective way of initiating children into their first formal learning experiences; to experiment with various processes and newly designed learning apparatus and materials.

Subjects: Roughly 100 children, ages three to six.

Methods: Application of Montessori Method, i.e., utilization of prepared environment in which learning materials and tasks are designed to capitalize on successive readiness levels of preschool age children. Individualized

approach is stressed with independent self-learning the objective.
Duration: June 1963-December 1965.
Investigator(s): Urban H. Fleege, Ph.D., Associate Vice President, Institutional Planning and Educational Research, DePaul University, Chicago, Ill. 60604.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: 125 copies of the final report will be made available to the U. S. Office of Education Cooperative Research Branch. If findings warrant, project will be described in articles for publication in appropriate journals.

19-OM-4 ACHIEVEMENT MOTIVATION, SELF-ESTEEM, AND GENERALIZATION OF SUCCESS AND FAILURE

Purpose: To find out whether motivational measures can help account for steepness of generalization to similar or dissimilar tasks following success and failure.
Subjects: Second grade boys.
Methods: Repetition choice measure of achievement motivation; embedded figures as a very indirect measure of self-orientation; and Gewirtz (Hava) choice measures of puzzles following success and failure.
Duration: June 1964-August 1965.
Investigator(s): Joseph Veroff, Ph.D., Senior Study Director, Institute for Social Research, University of Michigan, Ann Arbor, Mich.
Cooperating group(s): Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: To be written as article for Child Development.

19-OM-5 RESPONSE SET, TEST STRUCTURE, AND DEMOGRAPHIC CORRELATES OF TEST ANXIETY AND DEFENSIVENESS IN AN ELEMENTARY SCHOOL POPULATION

Purpose: To provide a pool of subjects with measured levels on Test Anxiety Scale for Children and Defensiveness Scale for Children from which subjects can be selected for further studies which require certain levels of these variables; to investigate methodological questions in assessment of personality by questionnaire-type devices, especially acquiescence response set; to consider homogeneity of Defensiveness Scale for Children with respect to its current content and to consider broadening of its content; and to investigate, in a more diversified sample population than has previously been available, selected demographic and school achievement correlates of TASC and DSC.
Subjects: All students in regular second grade classes in a single metropolitan county public school system, 8,000 to 9,000 students.
Duration: 1965-1966.
Investigator(s): Sheila C. Feld, Ph.D., Mental Health Study Center, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, 2340 University Blvd., East, Adelphi, Md.

19-OM-6 EDUCATIONAL STATUS OF CHILDREN DURING FIRST SCHOOL YEAR FOLLOWING FOUR YEARS OF LITTLE OR NO SCHOOLING

Purpose: To determine measurable changes in academic aptitude, educational

achievement, occupational and educational aspiration and self-concept on previously educationally-deprived Negro children after a year of resumed formal education.
Subjects: Approximately 1,000 Negro children suffering various amounts of educational deprivation formed population of interest from which subsamples were drawn. Samples consisted of both sexes; ages ranged from 5 to 18 years.
Methods: Group and individual measures of aptitude and achievement as well as self-concept and aspiration questionnaires were administered before and after year of formal schooling.
Findings: While results are still being analyzed, certain overall comments might be made. Year of schooling showed majority of children tested (but far from all) improved on aptitude and achievement measures. However, at no age level did the severely deprived (four years of nonschooling) catch up to moderately deprived (0 to 3.5 years of nonschooling) in terms of mean scores. While educational aspirations rose, occupational aspirations did not. Critical age periods for gains on specific abilities were evident.
Duration: April 1964-March 1966.
Investigator(s): Robert L. Green, Ph.D., Assistant Professor, College of Education, Michigan State University, East Lansing, Mich.; Louis J. Hofmann, Ph.D., Assistant Professor, New York University, New York, N. Y.; and Kenneth Moreland, Ph.D., Professor of Sociology and Anthropology, Randolph-Macon Women's College, Lynchburg, Va.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Paper presented at the 73rd Annual Convention of the American Psychological Association in Chicago, September 3, 1965.

19-OM-7 VALIDATION OF TESTING PROCEDURES

Purpose: To devise a screening test to pick children at first grade level who will have learning disorders.
Subjects: First grade pupils in East Providence, R. I.
Methods: Test devised by a pediatric-neurologist and a team of therapists and psychologists includes items covering neurological, gross motor, fine motor, eye-hand coordination, language, and psychological variables validated on approximately 650 first graders. Measures are obtained on test-retest and interrater reliability; test is designed for administration by an "untrained" tester.
Findings: Test predicts learning difficulties 92 percent correctly.
Duration: September 1963-November 1965.
Investigator(s): Eric Denhoff, M.D., Medical Director, Meeting Street School, 333 Grotto Ave., Providence 6, R. I. (Reported by Margaret Langdon, Executive Director, Meeting Street School.)
Cooperating group(s): Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Paper to be presented at the International Congress of Pediatrics in Tokyo, November 1965. Publication plans not yet settled.

19-OP-1 IDENTIFICATION CHARACTERISTICS OF CHILDREN IDENTIFIED AS GIFTED, NONGIFTED, CREATIVE, AND NONCREATIVE

Purpose: To try to establish why some gifted children are difficult to identify and why some nongifted children are mistakenly classified as gifted.
Subjects: 161 boys and girls in grades four, five, and six.
Methods: Utilization of nine different tests which measure intelligence,

achievement, creativity, anxiety, personality, and peer-identification.
Duration: October 1962-December 1964.
Investigator(s): Earl Doughty, Jr., Ph.D. Candidate, Department of Elementary Education, Southern Illinois University, Carbondale, Ill.
Publication: Data and results will be available in a doctoral dissertation scheduled for completion by end of calendar year 1964.

19-OP-2 BILINGUAL READINESS IN PRIMARY GRADES

Purpose: To demonstrate how the reality of two different language groups being present within same classroom can be utilized to develop bilingual readiness in both English speaking and non-English speaking children, as well as positive attitudes towards and respect for one's own native culture and language and culture and language of other ethnic groups.
Methods: Bilingual communication will be used in experimental groups of public school kindergarten and first grade classes of predominantly bi-ethnic constellation. All activities for the two separate language groups within one classroom will be carried on simultaneously and will be coordinated into framework of regular programs. Peer interaction will be utilized to the fullest to achieve respective objectives of language readiness and attitudes.
Duration: Not reported-June 1966.
Investigator(s): Mary Finocchiaro, Professor of Education, Hunter College, City University of New York, 695 Park Ave., New York, N. Y.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

19-OS-1 STUDIES IN SCHOOL ACHIEVEMENT: I. ACHIEVEMENT AND NONACHIEVEMENT AMONG LOWER CLASS FOURTH GRADE NEGRO CHILDREN--AN INTERDISCIPLINARY STUDY OF PERSONALITY, FAMILY, SOCIAL NETWORK AND ACHIEVEMENT

Purpose: A pilot study to bring both psychiatric and anthropological perspectives to bear on the problem of underachievement amongst lower class Negro children.
Subjects: Four boys and four girls from the same fourth grade class in a public elementary school in a low socio-economic Negro area of Chicago. Achievement levels range from high to low among the group, and family types are of both single- and dual-parent base.
Methods: Psychiatric interviewing of children, psychological testing (WISC, CAT, Rosenzweig P-F Test, and Menninger Sentence Completion Test), and intensive anthropological interviews of the children's parents. Half the parents were also interviewed by a psychiatrist.
Duration: October 1962-not reported.
Investigator(s): Jay G. Hirsch, M.D., Senior Research Associate, and Daniel R. Scheinfeld, M.A., Research Associate, Institute for Juvenile Research, 907 S. Wolcott St., Chicago 12, Ill. (Reported by Noel Jenkin, Ph.D., Director of Research, Institute for Juvenile Research.)

19-OS-2 CORRELATES OF ACHIEVEMENT AND UNDERACHIEVEMENT IN FOURTH GRADE URBAN NEGRO CHILDREN AND THEIR SCHOOL-AGE SIBLINGS--A STATISTICAL STUDY

Purpose: To explore relationship of family size, household composition, birth order, sex, and age on distribution of school achievement, grades,

I.Q. score, and conduct both within and between families of lower class Negro children in an urban, public elementary school fifth grade.
Subjects: 150 fifth grade students from a disadvantaged Negro area attending the same public elementary school in Chicago, and all of their school-age siblings.
Methods: Family and household composition interviews were carried out on all fifth grade subjects, on whom school cardex cards are also available. School cardex cards are also available for most of the school-age siblings. School achievement scores, grades, group I.Q. scores, and conduct grades will be tabulated against family size, household composition, birth order, and sex.
Duration: May 1964-not reported.
Investigator(s): Daniel R. Scheinfeld, M.A., Research Associate; Jay G. Hirsch, M.D.; and Daniel Solomon, Ph.D., Senior Research Associates, Institute for Juvenile Research, 907 S. Wolcott St., Chicago 12, Ill. (Reported by Noel Jenkin, Ph.D., Director of Research, Institute for Juvenile Research.)
Publication: Planned for appropriate scientific journals.

19-OS-3 THE EARLY ELEMENTARY SCHOOL RECORD AS A PREDICTOR OF HIGH SCHOOL ACHIEVEMENT IN URBAN LOWER CLASS NEGRO STUDENTS

Purpose: To discover whether achievement or nonachievement at high school level can be predicted on basis of academic performance and conduct in grades one to four.
Subjects: Two samples are involved: (1) two groups of Negro high school students from a single west side high school--34 seniors with high grades (2.0 or better on 4.0 scale) and 39 sophomores with very low grades (less than 1.0 on 4.0 scale); and (2) 60 seniors (30 boys and 30 girls) with high grades (2.0 or better on 4.0 scale), 60 seniors (30 boys and 30 girls) with low grades (1.5 or below on 4.0 scale), and 60 dropouts (30 boys and 30 girls) with grade point average of 1.0 or less prior to dropping out. Students are Negro, from same west side high school. Only those students having early elementary school records in their files were used in the study.
Methods: On both samples the following data have been collected: academic grades in each subject for early elementary school up through present; conduct grades in elementary school; math and reading achievement scores from elementary school; and high school achievement test data.
Findings: Results of discriminate function analysis were as follows: taking four indicators of achievement in grades one through four, grades were found to be the best predictor of high school grades. Sex accounted for largest amount of remaining variance. Conduct accounted for next largest amount of variance. Math and reading scores added little predictive power after these other three variables were accounted for.
Duration: August 1963-August 1965.
Investigator(s): Daniel R. Scheinfeld, M.A., Research Associate; Jay G. Hirsch, M.D.; and Daniel Solomon, Ph.D., Senior Research Associates, Institute for Juvenile Research, 907 S. Wolcott St., Chicago 12, Ill. (Reported by Noel Jenkin, Ph.D., Director of Research, Institute for Juvenile Research.)

19-OS-4 STUDIES IN SCHOOL ACHIEVEMENT, IV: DETERMINANTS OF ACHIEVEMENT AND UNDER-ACHIEVEMENT AMONG LOWER CLASS NEGRO CHILDREN--SOCIAL PSYCHOLOGICAL PERSPECTIVES

Purpose: To discover those characteristics of parental behavior with

particular reference to their children's achievement task performance which help to produce scholastic achievement and achievement behavior in their children.
Subjects: 40 to 50 lower class Negro fifth graders from a single school, all from intact families; mothers and fathers of these children.
Methods: Parental behavior is being assessed in a situation where the child works on a series of problems in presence of parents, who are told that they may give child any help they like. Degree and kind of help is noted; directness versus indirectness of instructions, degree of expressed approval and encouragement; apparent interest in tasks and in child's performance are among other measured variables of parental behavior. Ratings are made at end of each task, at conclusion of session, and from tape recordings of session. These parental behaviors are to be related to children's school records, to achievement test scores, to child's classroom behavior, and to child's achievement behavior in independent testing sessions.
Duration: May 1964-December 1965.
Investigator(s): Daniel Solomon, Ph.D., Senior Research Associate, Institute for Juvenile Research, 907 S. Wolcott St., Chicago 12, Ill. (Reported by Noel Jenkin, Ph.D., Director of Research, Institute for Juvenile Research.)
Cooperating group(s): Foundations' Fund for Research in Psychiatry.
Publication: Plan to submit findings to suitable journals.

19-OS-5 DETERMINANTS OF ACHIEVEMENT AND UNDERACHIEVEMENT AMONG LOWER CLASS NEGRO CHILDREN--PSYCHIATRIC PERSPECTIVES

Purpose: To identify and describe certain personality characteristics of achieving and underachieving elementary school lower class Negro children.
Subjects: Fifth grade children from a public elementary school in disadvantaged Negro area in Chicago; eight boys and eight girls, half of whom are achievers and underachievers respectively. Achievement is defined on basis of grade averages, and to a lesser extent by achievement test scores. Measured intelligence (Lorge-Thorndike) is to be similar for both groups.
Methods: A battery of psychological testing and three psychiatric interviews are to be administered to each child in sample. Variables to be explored are: self-reliance, autonomy, impulse control, delay of gratification, constructive aggression, self-esteem, sex-role identity, social identity, achievement standards, attainment value, anxiety, and emotional freedom to learn.
Duration: May 1964-not reported.
Investigator(s): Jay G. Hirsch, M.D., Senior Research Associate, Institute for Juvenile Research, 907 S. Wolcott St., Chicago 12, Ill. (Reported by Noel Jenkin, Ph.D., Director of Research, Institute for Juvenile Research.)
Cooperating group(s): Foundations' Fund for Research in Psychiatry.
Publication: Data will be published in appropriate professional journals.

19-OS-6 A STUDY OF THE RELATIONSHIP OF BIRTH ORDER TO SCHOOL ACHIEVEMENT

Purpose: To determine whether birth order is related to school achievement, when intelligence is held constant by covariance adjustment.
Subjects: 200 public school students in grades 5, 8, and 11.
Methods: Analysis of variance and covariance using as variables I.Q. achievement, grade point average, sex, race, and birth order.
Duration: July 1961-not reported.
Investigator(s): Noel Jenkin, Ph.D., Director of Research, and Mark

Oberlander, B.A., Research Associate, Institute for Juvenile Research, 907 S. Wolcott St., Chicago 12, Ill.

19-OS-7 TRAITS OF SCHOOL ACHIEVERS FROM A DEPRIVED BACKGROUND

Purpose: To identify characteristics of successful school achievers among underprivileged Negro children.
Subjects: 80 "good" achievers (40 boys, 40 girls) and 80 "poor" achievers (40 boys, 40 girls). Good group was achieving at or above grade level, poor group at least 1.5 years below grade as measured by standardized tests. All were Negro, from lower class families in an urban depressed area and free of gross mental, emotional, or physical deficiencies.
Methods: All subjects were given a battery of tests selected to cover a broad spectrum of personality characteristics (WISC, Rorschach, Story Telling, Bender-Gestalt, Uses of Objects, Object Sorting, Semantic Differential, Free Drawings, Drawing Completion, Self-Concept Checklist, Test of Caution, and Achievement Attitudes Test). Also, a pediatrician examined each child and a social worker visited each family at home to interview parents. Intensive case studies of a subsample of 40 children will be undertaken next year.
Duration: September 1964-January 1966.
Investigator(s): Helen H. Davidson, Ph.D., Associate Professor, and Judith W. Greenberg, M.S., Instructor in Education, The City College, City University of New York, Convent Ave. and 138th St., New York, N. Y.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

19-OS-8 NONINTELLECTIVE VARIABLES RELATED TO ACADEMIC ACHIEVEMENT OF BRIGHT JUNIOR HIGH SCHOOL BOYS

Purpose: To study various personality variables as related to school achievement.
Subjects: 262 eighth-grade boys from urban areas, WISC I.Q.'s of 116 or higher, carrying normal class load, and of appropriate age for grade. Sample from 18 schools in two cities.
Methods: On basis of seventh and eighth grade grade-point averages and total scores on Iowa Test of Basic Skills, subjects were ranked on composite achievement and divided into high, average, and low groups. All subjects tested with California Psychological Inventory, interviewed, card sort of motives, Bills IAV. High and low groups tested with 10-card TAT, 4-slide projected school TAT (after Des Charmes), and adaptation of Dunn's visual discrimination tachistoscopic test. Factor analysis, regression, and other analyses made.
Duration: July 1964-August 1965.
Investigator(s): Thomas A. Ringness, Ph.D., Professor of Educational Psychology, University of Wisconsin, Madison, Wis.
Cooperating group(s): Madison and Janesville, Wisconsin Public Schools; Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Articles will be published as prepared; reprints will be available. Limited number of final reports.

19-OS-9 DETERMINANTS OF ACHIEVEMENT AND UNDERACHIEVEMENT AMONG LOWER CLASS NEGRO CHILDREN--SOCIAL ANTHROPOLOGICAL PERSPECTIVES

Purpose: To study socialization along those dimensions most related to motivation for academic achievement amongst fifth grade lower income Negro children and exploration of relation of differential socialization to a variety of other social and cultural phenomena such as family structure and parents' view of social reality.
Subjects: 24 families (16 duo-parent, and 8 father-absent) from the lower income Negro population on the west side of Chicago. Special attention given to the fifth grader from each of these families and parents or parent surrogates. Families are those of 24 fifth graders from a single school. All fifth graders are within the 89-104 range on the Lorge-Thorndike verbal I.Q. Sample is further controlled for high and low achievement as measured by grades. Hence, 6 girl achievers, 6 boy achievers, 6 girl nonachievers and 6 boy nonachievers along with their families make up sample.
Methods: Six to 10 intensive interviews with each parent and two interviews with each child. Interviews of fathers are conducted by principal investigator and interviews of mothers are conducted by female research assistant.
Duration: May 1964-February 1966.
Investigator(s): Daniel R. Scheinfeld (Ph.D. Candidate), Research Associate, Institute for Juvenile Research, 907 S. Wolcott St., Chicago 12, Ill. (Reported by Noel Jenkin, Ph.D., Director of Research, Institute for Juvenile Research.)

19-OS-10 USE OF A DEVELOPMENTAL INDEX TO PREDICT PUPIL ACHIEVEMENT

Purpose: To determine extent to which growth, physical performance, intellectual, and social-emotional variables, when combined into a developmental index, can be used to identify high and low achievers in language arts, arithmetic, and science in grades four through six.
Subjects: Data on variables collected for some 260 children in fourth, fifth, and sixth grades.
Methods: Factor analysis used to identify developmental factors and loading for each. Profiles of high and low achievers are being compared with those of normal achievers in each grade.
Findings: Indicate that various aspects of development can be identified discretely, that intellectual factor makes major contribution to prediction of school achievement, and that physical performance and emotional development factors are most important nonintellectual factors in predicting achievement. Comparison of developmental profiles for the three years is planned in order to determine relationship between changes in pupil development and achievement.
Investigator(s): Dr. John E. Owens, Director of Instructional Services, Roslyn Public Schools, Roslyn, N. Y.
Cooperating group(s): Office of Research and Evaluation, New York State Education Department.

19-OS-11 MILIEU FACTORS ASSOCIATED WITH ACADEMIC ACHIEVEMENT AND UNDERACHIEVEMENT OF SPANISH-AMERICAN SECONDARY STUDENTS

Purpose: To determine why students of same intellectual abilities are dissimilar in academic achievement.
Subjects: Approximately 100 Spanish-American secondary students, both boys and girls.
Methods: Questionnaire, rating scale data correlated with grade-point

average.
Duration: May-October 1965.
Investigator(s): Lois Jean Gill, Ph.D., Counselor, Denver Public Schools, Denver, Colo.
Publication: *Journal of Educational Psychology*.

19-OS-12 SLOW LEARNERS, COMPETITION, AND PROGRAMMED INSTRUCTION

Purpose: To test hypotheses that: (1) under conditions of group pacing, performance of low ability students will be positively affected when group is relatively homogeneous with respect to ability, and negatively affected when group is heterogeneous, i.e., includes students of high and low ability; and (2) these effects upon performance will be greater when all members of a group are given knowledge of performance of each individual than when knowledge of individual performance is available only to the individual.
Methods: Study will examine effects of two aspects of competition upon performance of low ability student under conditions of group-paced programmed instruction; effect of intensifying the reward system, and of limiting access to rewards. Reward is defined as "psychic" satisfaction that students experience from immediate knowledge of results found in programmed instruction and from knowledge of performance within a group.
Duration: July 1963-August 1964.
Investigator(s): Casper F. Paulson, Jr., Teaching Research Division, Oregon State System of Higher Education, Oregon College of Education, Monmouth, Oreg.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

19-OS-13 TEST ANXIETY, DEFENSIVENESS, AND NEED FOR ACHIEVEMENT IN YOUNG BOYS: THEIR INTERRELATIONSHIPS, AND RELATIONSHIPS TO PARENTAL ATTITUDES TOWARD INDEPENDENT ACCOMPLISHMENT

Purpose: To investigate interrelationships among aspects of achievement strivings in young boys; and to replicate and extend previous findings on relationship of parental attitudes toward independent accomplishment to need for achievement.
Methods: Projective measurements (story completion) of need for achievement in individual test sessions and group-administered Test Anxiety Scale for Children and Defensiveness Scale for Children were employed. Parental attitudes were assessed by questionnaire.
Duration: 1965-1966.
Investigator(s): Sheila C. Feld, Ph.D., Mental Health Study Center, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, 2340 University Blvd., East, Adelphi, Md. 20783.

19-OV-1 PREDICTION OF SEPARATION PROBLEMS AND OTHER EMOTIONAL PROBLEMS AMONG NURSERY SCHOOL CHILDREN

Purpose: To ascertain whether a questionnaire administered prior to entry in a nursery school may facilitate rapid identification of children who need special preparation for that entry. If such children could be identi-

fied before first day of school, their separation problems could be eased by special technique such as home visits and visit by child to classroom alone with teacher.
Subjects: 15 nursery school children entering a small, private suburban nursery school. Expansion of study to include 200 subjects is contemplated.
Methods: A questionnaire was filled in by parents. Data particularly emphasized were previous separation experiences, traumatic experiences, capacity to form new relationships with children and adults, special assets and weaknesses of the child, and neurotic traits. A psychiatrist rated these questionnaire responses according to a simple scheme. Each child was rated from 0-3 plus, on a scale for predicted separation problems, and from 0-3 plus on a scale for other predicted problems to be manifested in school. These ratings were then compared blindly with similar ratings compiled from teachers' accounts about the children's behavior at the end of one week, two weeks, and nine months in school.
Findings: Although current numbers are too small to warrant serious statistical consideration, it does appear likely that it is possible to predict before school begins which children will have "separation problems" and which will have "other emotional problems." There was particular success in predicting "other emotional problems to be manifested in school," 13 out of 15 predictions being correct to within 1 rank when comparing preschool predictions with the teacher's descriptions at the end of two weeks. Prediction of separation problems was only slightly less successful, 12 out of 15. Results for the nine-month predictions are not yet available.
Duration: September 1964-July 1967.
Investigator(s): Gilbert Kliman, M.D., Director; Doris Gorin, B.A., Education Director; and Elissa Burian, M.A., Educational Consultant, Center for Preventive Psychiatry, 2 Maplemoor Lane, White Plains, N. Y.
Publication: American Journal of Orthopsychiatry, or Journal of Child Psychiatry.

19-OV-2 AN EXPLORATORY STUDY OF STUDENT ATTITUDES IN THE PRIMARY GRADES

Purpose: To explore feasibility of using semistructured sketches of classroom interactions to study primary grade pupils' attitudes toward school and their teachers.
Subjects: 112 first and second grade girls and boys selected from schools in several communities differing in socio-economic characteristics and urban-rural location.
Methods: In individual interviews, subjects were shown a series of 12 specially prepared sketches depicting teacher-child or child-child interaction in classroom. They were asked to tell what had led up to pictured situation or what would happen next. Responses were studied both in terms of overt content and in terms of underlying attitudes that they were believed to reveal. Responses were judged independently by four judges. Chi-square and analysis of variance were used to analyze school, grade, and sex differences. Inter-item correlations were computed.
Findings: Children were highly responsive to interview. Judges showed high agreement in their scoring. Items believed to be tapping aspects of same attitude were positively correlated. Major school, sex, or grade differences were not found.
Duration: October 1964-June 1965.
Investigator(s): Sandra R. Cohen, Ph.D., Associate Research Psychologist, Educational Testing Service, Princeton, N. J. (Reported by John K. Hemphill, Ph.D., Director, Developmental Research Division, Educational Testing Service.)
Cooperating group(s): Commonwealth of Pennsylvania.
Publication: Will seek publication as a monograph; will appear prior to publication as a Research Bulletin of Educational Testing Service.

19-OV-3 TEACHER DECISION MAKING IN AN URBAN CLASSROOM

Purpose: To analyze an important practical educational problem in contemporary society: a middle class teacher's attempts to work with a group of children from an urban slum neighborhood.
Methods: Theoretical framework is a critical synthesis of such social system concepts as external system, internal system, practical equilibrium, norm, interaction, activity and sentiment, and of such decision-making concepts as choice, fact and value propositions, alternatives, consequences and effectiveness. Standard participant observation procedures for an exploratory field study of an ongoing institution have been utilized. Principal investigator has spent a full semester all day-every day in direct observation of a single elementary school classroom in an urban slum area. Research associate is a regularly-employed public school teacher. Field notes of direct observations and informal interviews with pupils and teachers form basic concrete data which are to be analyzed.
Duration: Not reported-October 1965.
Investigator(s): Louis M. Smith, Ph.D., Associate Professor of Education and Psychology, Graduate Institute of Education, Washington University; and George Fairgrieve, St. Louis Schools, St. Louis, Mo.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

19-OV-4 YOUTHLINGS' MORAL AGE IN SCHOOL

Purpose: To gain some knowledge of 11-, 12-, and 13-year old children's moral and social growth in school as children themselves experience it and work for such growth.
Subjects: 200 sixth grade boys and girls (youthlings), above average in intelligence and socio-economic background, from a suburban public school in Ohio, attended by gentile, Jewish, and Negro children.
Methods: As an outgrowth of a class discussion, the children chose the term "moral age" to describe their age in character and personality development, as compared to their chronological age, mental age, and age measures of other achievements. Moral age indicates degree of maturity they have reached as expressed by their daily behavior in school. Such activities have to do with their relationship to teacher, class, schoolwork, relationship to others, and personal habits. Specific items that make up the children's ideas of moral and social age in school were obtained from the children themselves and developed into charts and tests which the children used as daily guides to measure their personal behavior in school. Their growth in moral age was also measured by items on their report cards and by increasing awareness of their privileges and responsibilities. At the end of the year the children explained how they had grown in moral age in school.
Findings: Children's growth in moral age in school can be stimulated by helping them become aware of their moral age and working to improve in specific ways, such as relationship to teacher and class, school work, obedience, respect, cooperation, being quiet, taking schoolwork seriously, being polite and friendly, having a good personality, carrying responsibilities, and being true to oneself and one's conscience.
Investigator(s): Rose Zeligs, Ed.D., Certified Psychologist in Private Practice, 14256 Ventura Blvd., Sherman Oaks, Calif. 91403.

19-OV-5 SCHOOL ADJUSTMENT AND MALADJUSTMENT OF BOYS OF LOWER SOCIO-ECONOMIC STATUS

Purpose: To find data which may explain why some lower socio-economic boys are successful in school while others do less well or fail, and data on relative success levels of such boys in school as compared with girls of same socio-economic status.
Subjects: Pupils from fifth and sixth grades of one elementary school in New York City metropolitan area, with a total population of about 300 children, half of them boys.
Methods: High, middle, and low achieving boys will be compared for attitudes and values, home conditions, physical characteristics, peer relations, and "masculine" status and attitudes. To distinguish between boy and girl behavior, data sought will be information about relative school adjustment, masculine and feminine characteristics, interest inventories, and interviews to obtain anecdotal material on attitudes toward school, self, and others.
Duration: Not reported-September 1966.
Investigator(s): Patricia Cayo Sexton, Ph.D., Associate Professor of Educational Sociology, New York University, 4 Washington Square, New York 3, N. Y.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-OY-1 RESULTS OF SYSTEMATIC SUSPENSION: A GUIDANCE TECHNIQUE TO HELP CHILDREN DEVELOP SELF-CONTROL IN PUBLIC SCHOOL CLASSROOMS

Purpose: To evaluate effectiveness of technique of systematic suspension in one school, where it has been in operation for several years, from viewpoints of children, teachers, and parents.
Subjects: 23 children in Magruder School, Torrance Unified School District, who had been on systematic suspension at some time during past three years.
Methods: Questionnaires were devised for children, teachers, and parents who had been active in this technique, with questions designed to assess amount of change observed (in such areas as conduct and work and study habits at home and school), feelings which built up in children and parents during the process, and whether or not technique effectively changed child's behavior.
Findings: Teachers felt that all children showed improvement in behavior, most within a few weeks' time, and school work also began to improve. Children felt that they had all changed their behavior for the better, and none really wanted to go home during the school day. Parents felt that: (1) children would not respond to this technique--they were amazed when they found this to be untrue; and (2) about two-thirds of the children had improved after 10 months. Half the parents had doubts about the technique when first presented, but after a few weeks had definitely made up their minds whether they liked or disliked it. About one-half approved of the technique after six months, and the other half either had some doubts or disapproved of the technique altogether. In general, research confirmed investigator's evaluation of systematic suspension and even increased their enthusiasm for the technique, based on careful selection of children, frequent parent counseling to help change parent attitudes, and consistent, efficient teacher understanding of the process.
Duration: September 1961-September 1964.
Investigator(s): Edwin R. Brown, M.A., Principal, Philip Magruder Elementary School, and Eloise Shields, M.A., School Psychologist, Torrance Unified School District, 4100 W. 185th St., Torrance, Calif.
Publication: Article is being submitted at present to Elementary School Journal.

19-OY-2 AN ATTITUDE SURVEY OF HIGH SCHOOL DROPOUTS BY MEANS OF THE SEMANTIC DIFFERENTIAL PROCESS

Purpose: To identify those attitudes which differentiate between high school dropouts and nondropouts.
Subjects: Total tenth, eleventh grade populations in three southern California high schools; 1,630 tenth grade and 1,465 eleventh grade pupils.
Methods: Meaning of words test was administered to all pupils in October 1963. Dropout group was drawn from the sample as each occurred. Control group was matched on grade level, sex, I.Q. (group), and father's occupation.
Duration: October 1963-June 1965.
Investigator(s): Bruce E. Strem (Ph.D. Candidate, University of Southern California), Consultant in Child Welfare and Attendance, Los Angeles County Superintendent of Schools, 155 W. Washington Blvd., Los Angeles 15, Calif.
Publication: Doctoral dissertation, Department of Educational Psychology, University of Southern California.

19-OY-3 SCHOOL DROPOUT RESEARCH REPORT FOR THE STAMFORD COMMUNITY COUNCIL COMMITTEE ON HIGH SCHOOL DROPOUTS

Purpose: (1) To find out everything possible about lifelong needs, problems, pleasures, attitudes and ideas of the school dropout and potential dropout, and to help him wherever possible; (2) to enlighten professional and lay persons as to the individual dropout or potential dropout and his problems, especially as they might pertain to unmet needs in the particular community.
Subjects: 15 local youths, five of them dropouts, the other 10, potential dropouts.
Methods: Volunteer workers--professional social workers, guidance instructors, school teachers, and interested homemakers with special skills--worked with a research coordinator. Each volunteer worker was assigned to follow one child for a year. After obtaining parent's approval and cooperation, worker would see child each week and attempt to build a relationship which would enable child to confide in worker. It was expected that worker would gain some understanding of family and environmental situation of each child, as well as child's personal problems and his own perception of them. Where need was found, workers were instructed to assist child, or his family, in any possible way. Volunteer workers met regularly as a group with research coordinator to report on individual progress and discuss common problems.
Duration: January 1964-January 1965.
Investigator(s): Leonard Kleinman, Supervisor, and Mrs. Sherman Bletchman, Coordinator, Stamford Community Council Committee, 77 South St., Stamford, Conn. (Reported by Joseph A. Zita, Executive Director, Stamford Community Council Committee.)
Cooperating group(s): The Stamford Foundation.

19-OY-4 HOME VISITING IN PUPIL PERSONNEL WORK

Purpose: To evaluate some dynamics of home visiting as this technique is utilized in pupil personnel work.
Subjects: One set of parents whose child had been referred to the Pupil Personnel Department for placement in a special education situation.
Methods: Investigators engaged in joint home visiting with subjects. A psychological evaluation of the child was done at Mental Health Study Center, and on basis of this evaluation and data supplied by pupil personnel worker and classroom teacher, the child was placed in a residential school

for children with special learning difficulties. While child was in placement, investigators made joint home visits to family, carefully documenting their experiences through process recording. After each home visit, a conference was held with consultant to consider issues which had emerged during previous home visit.
Investigator(s): Richard A. Mackey, M.S.W., Psychiatric Social Worker, and Charlotte S. Spencer, M.Ed., Pupil Personnel Worker, Board of Education, Prince George's County, Upper Marlboro, Md.

19-OY-5 HIGH SCHOOL DROPOUTS

Purpose: To investigate impact of family upon persistence in school.
Subjects: 3,000 white high school students in Greensboro, N. C. high schools, grades 7 to 12 in 1960.
Methods: Questionnaire data in 1960; follow up to see academic progress by 1965.
Duration: 1960-December 1966.
Investigator(s): Dean D. Knudsen, Ph.D., Assistant Professor of Sociology, Ohio State University, Columbus, Ohio 43210.
Publication: Publication planned when all students have graduated or withdrawn from school.

19-OY-6 OCCUPATIONAL CHOICE AND SCHOOL DROPOUT OF PUERTO RICAN YOUTH

Purpose: To study factors influencing decision to drop out of school before completion of twelfth grade; to determine factors influencing decision to enter labor force before entering university work; to determine factors influencing occupational career planning; and to study factors influencing decision to enter or not to enter such selected occupations as teaching, social work, and business.
Subjects: A purposive sample was drawn, in which the following factors were considered: type of school (public-private, secular-religious); economic region (tobacco area, sugarcane area, coffee area, industrial zone); location (city-town, rural areas). A representative group of each school was selected, including students of varied academic indexes (from high to low), to be interviewed. The number of students reporting were as follows: 296 sixth grade, 320 ninth grade, and 195 twelfth grade.
Methods: Two different schedules were administered to students: one for sixth grade students and the other for ninth and twelfth grade students. Both included questions on occupational plans and aspirations, as well as on other factors that were to be considered as independent variables. One year after original interviews, a follow-up of students was conducted in order to know if they continued studying or dropped out of school. Factors associated with dropout are being studied.
Duration: May 1962-1966.
Investigator(s): Agneris Guzman de Duran, B.A., Assistant Sociologist; Jenaro Collazo, M.S., Associate Sociologist; and Ruth M. Silva de Bonilla, M.A., (formerly Research Assistant, Agricultural Experiment Station, Department of Agricultural Economy and Rural Sociology, University of Puerto Rico, Box 516, Rio Piedras, Puerto Rico.
Cooperating group(s): San Antonio elementary, junior, and high schools; Puerto Rico elementary, junior, and high schools; Commonwealth Department of Education.
Publication: Some data already published; other publications planned.

19-OY-7 EMPLOYMENT STATUS AND CHARACTERISTICS OF HIGH SCHOOL DROPOUTS OF HIGH ABILITY

Purpose: Study will involve youth of above average intellectual ability who have withdrawn from Pennsylvania schools during the 1964-65 school year before completing grade 12 and is designed to: (1) determine their employment status; (2) determine their pattern of interests and personality; (3) suggest occupational fields for which training programs should be developed; and (4) provide data from which an instrument may be constructed for identifying students who will benefit from proposed training program.
Subjects: 100 girls and 100 boys drawn from a population of approximately 2000 dropouts having I.Q.'s of 110 or above. There will also be 100 girl and 100 boy persisters selected by matching them with dropout sample.
Methods: The Minnesota Vocational Interest Inventory, the High School Personality Questionnaire, and the Student Information Blank will be administered to dropouts and persisters, and an interview will be conducted to search for real reasons for withdrawal from or continuation in school. Friends of dropouts will be interviewed to gain additional insight into interests and personality of dropouts. Test results of dropouts and persisters will be compared. Information and test scores pertaining to dropout group will be analyzed to determine occupational fields for which training programs should be developed and techniques for identifying potential dropouts.
Duration: April 1965-June 1966.
Investigator(s): Joseph L. French, Ed.D., Professor of Special Education and Educational Psychology, Pennsylvania State University, University Park, Pa. 16802. (Reported by Bartell W. Cardon, Research Assistant, Department of Special Education, Pennsylvania State University.)

19-OY-8 NEW CLASSROOM AND COUNSELING TECHNIQUES FOR DEALING WITH TROUBLESOME YOUTH

Purpose: An experiment in devising new classroom and counseling techniques for youth identified as "trouble makers" in two junior and two senior high school classes. Schools are in areas of marked social pathology, including high rates of delinquency.
Methods: Guided classroom interaction under leadership of a psychologist and an anthropologist; concurrent workshops with faculty members to seek more productive ways of coping with behavioral problems of troublesome youth based on materials gathered in student sessions; meetings with school administrators to focus on changes in school policy to make school environment more conducive to behavioral adjustment of these youth; evaluation of student and teacher change.
Duration: November 1964-November 1965.
Investigator(s): Joseph D. Lohman, M.A., Dean, School of Criminology, University of California, Berkeley, Calif.
Cooperating group(s): Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-OY-9 COLORADO DROPOUT PROJECT

Purpose: To decrease rate of pupil dropout in Colorado; to evaluate effectiveness of different approaches used by school districts to reduce dropout rates; and to develop a model for local study and action through identification of common elements of most successful action-research programs.
Methods: Within framework of project, local school districts will determine

depth of their study of problem and extent of their action programs. Dropout rates and other relevant statistics and data will be compiled and an evaluation study will be carried out.
Duration: 1963-1968.
Investigator(s): Gerald Ulrich, Consultant, Colorado State Department of Education, State Office Bldg., Denver 2, Colo. (Reported in Current Projects in the Prevention, Control, and Treatment of Crime and Delinquency, Winter 1964-1965.)

19-OY-10 SAN BERNARDINO COUNTY "YOUTH OPPORTUNITY PROJECT"

Purpose: To test theory that "spending money" is a factor in possible school dropouts finishing their high school education.
Subjects: 40 students, primarily boys 15.5 to 17 years of age, selected by Colton Senior High School because they appeared likely to become school dropouts. 20 were randomly chosen to be experimental group, 20 to be control group.
Methods: Subjects will be assigned to an eight-hour day, forty-hour week, beginning June 22, and ending August 31. They will be paid 75 cents an hour, and $30 per week will be credited to each student's account. They will receive $10 per week during the summer and $5 per week during school year as long as they are attending school.
Duration: June 1964-July 1965.
Investigator(s): Stewart C. Smith, Chief Probation Officer; Sam R. Wyland; Roy C. Hill; and Eve McLain, County of San Bernadino, Room 326, Courthouse, San Bernadino, Calif. (Reported in Current Projects in the Prevention, Control, and Treatment of Crime and Delinquency, Winter 1964-1965.)
Cooperating group(s): Board of Supervisors, County of San Bernadino; San Bernadino Office of the State Department of Employment.

19-OY-11 SEPTEMBER EXTENDED DAY COUNSELING PROGRAM FOR SCHOOL DROPOUTS

Purpose: To coordinate back-to-school efforts for dropouts in order to insure full enrollment of students 16 years of age and older who had failed to return to school on the first day; and to provide immediate counselor service to enrolled students of or near to school-leaving age needing encouragement to remain in school.
Subjects: All students enrolled in high school in June, 1963, and those promoted from elementary grades, 16 years of age and older, who had not returned or enrolled on the first day in September; students needing immediate counselor service to encourage retention in school; and spring, 1963 dropouts who had not returned on first day of September.
Methods: Specific mimeographed instructions were outlined including methods for identification of student population to be included in program, methods of contact with students, and procedures to expedite operation of program. Appropriate publicity was given program through release of press reports and cooperation of news media.
Findings: Nearly 9,000 interviews were held and two months later, 40 percent of the returnees were still in school.
Duration: 1963-continuing.
Investigator(s): Benjamin C. Willis, General Superintendent of Schools, Board of Education, 228 North LaSalle St., Chicago 1, Ill. (Reported in Current Projects in the Prevention, Control, and Treatment of Crime and Delinquency, Winter 1964-1965.)
Cooperating group(s): Chicago Board of Education; President's Program to Prevent School Dropouts.

Specific skills

19-PD-1 PERCEPTUAL DEVELOPMENT AS RELATED TO READING PROGRESS IN EARLY SCHOOL YEARS

Purpose: To measure transposition between auditory and visual modalities and between temporal and spatial patterns, and to determine relationship of these measures to general intelligence and reading.
Subjects: Third and fourth grade children in public schools.
Methods: Several procedures have been developed to measure perceptual functions listed above. Group tests of general intelligence and standardized tests of reading comprehension are also administered to every subject. Multiple regression equations are used to determine contribution of each perceptual test, independent of mental age, to statistical prediction of reading ability.
Findings: A test requiring simultaneous transposition from auditory to visual and from temporal to spatial patterns was independently related to reading scores in fourth and in third graders. Another test (Birch and Belmont, 1964) did not contribute, independently of mental age, to the prediction of reading scores.
Duration: January 1965-December 1968.
Investigator(s): Mark Rudnick, Ph.D., Assistant Professor, and Graham M. Sterritt, Ph.D., Associate Professor of Psychology, University of Colorado Medical School, 4200 E. Ninth Ave., Denver, Colo. 80220.
Publication: Publications are being prepared on two completed studies.

19-PD-2 CHILDREN'S CONCEPTS OF THE READING PROCESS: A LONGITUDINAL STUDY

Purpose: To note the concept of reading the first grader brings to school with him, his self-image as a potential reader, and changes in both of these as the child progresses through school.
Subjects: Five classrooms of beginning first graders representing different racial and socio-economic groups.
Methods: Structured interview with each child; use of direct question plus projective techniques; teacher interviews and ratings; standardized tests of reading readiness, reading achievement, and intelligence; school cumulative record data.
Duration: September 1962-June 1964.
Investigator(s): Terry Denny, Ed.D., Assistant Professor, Purdue University, Lafayette, Ind.; and Samuel Weintraub, Ed.D., Assistant Professor of Education, University of Chicago, Chicago, Ill. 60637.
Cooperating group(s): Purdue Research Foundation; Scott, Foresman Research Fund.
Publication: The Reading Teacher, March 1963; The Elementary School Journal, Fall 1965; final report to be submitted in monograph form.

19-PD-3 COGNITIVE PROCESSES AND READING DISABILITY

Purpose: To ascertain relative importance of impaired functioning of language abilities versus visuospatial abilities as determinants of failure in reading at two stages of development; to investigate role of concept formation as a cognitive trait important for learning to read; and to determine consequences of reading failure on various aspects of cognitive

functioning.
Subjects: 300 first grade and 300 fifth grade children.
Methods: Subjects will be administered reading test, concept formation test, WISC, and a battery of tests which measure language and visuospatial abilities. First grade children will be retested at end of third grade. Comparisons will be made to determine effect of reading failure on concept formation ability and performance on the WISC.
Duration: Not reported-August 1966.
Investigator(s): James C. Reed, Ph.D., Director, Department of Reading and Study Skills, and Associate Professor of Psychology, Wayne State University, Detroit 2, Mich.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-PD-4 A STUDY OF THE RELATIONSHIP BETWEEN READING SCORES OBTAINED FROM AUDITORY AND SILENT ADMINISTRATION OF EQUIVALENT FORMS OF THE DIAGNOSTIC READING TESTS TO ESTABLISH A SCALE FOR DETERMINING READING DEFICIENCIES WITH RELATION TO INDIVIDUAL POTENTIAL

Subjects: Public school students.
Methods: Special formula developed by John Carroll of Harvard University.
Duration: 1954-not reported.
Investigator(s): Frances Triggs, Ph.D., Chairman, and Agatha Townsend, Ph.D., Editor, Committee on Diagnostic Reading Tests, Inc., Mountain Home, N. C.; Stanley Davis, Ph.D., Ohio State University, Columbus 10, Ohio; Frederick Westover, Ph.D., University of Alabama, University, Ala.; and John Waldman, Ph.D., Pace College, New York 38, N. Y.
Publication: Findings will be distributed through Committee publications.

19-PD-5 FACTOR ANALYSIS OF SCORES OF DIAGNOSTIC READING TESTS FROM KINDERGARTEN TO NINTH GRADE: RATES OF READING, COMPREHENSION, AND WORD ATTACK

Purpose: To determine to what extent these scores are pure factors.
Subjects: Public school students.
Methods: Verimax solution of factor analysis.
Findings: At upper grade levels, the factors as indicated by the title of the scores are evident.
Duration: 1963-1965.
Investigator(s): Frances Triggs, Ph.D., Chairman, and Agatha Townsend, Ph.D., Editor, Committee on Diagnostic Reading Tests, Inc., Mountain Home, N. C.; Stanley Davis, Ph.D., Ohio State University, Columbus 10, Ohio; Frederick Westover, Ph.D., University of Alabama, University, Ala.; and John Waldman, Ph.D., Pace College, New York 38, N. Y.
Publication: Findings will be distributed through Committee publications.

19-PD-6 AGE-GRADE READING RETARDATION BY ETHNIC GROUPS OF PUBLIC SCHOOL CHILDREN IN THE SAN LUIS VALLEY AND ENVIRONMENTAL/CULTURAL-RELATED CAUSATIONS

Purpose: To study cultural affect among Spanish-American children and Anglo-American children in learning to read; and to establish a basis for reading curriculum adjustments.
Methods: Application of testing instruments in measurement of reading skills and cultural influences in word-symbol association; study of correla-

tions for curricula implications.
Duration: November 1964-June 1965.
Investigator(s): Alfred M. Potts, Ed.D., Professor of Education and Chairman, Center for Cultural Studies, Adams State College, Alamosa, Colo. 81101.

19-PD-7 FOLLOW-UP STUDIES OF POOR AND GOOD READERS

Purpose: To study the subsequent reading progress of two groups of children classed as "poor" and "good" readers at the age of eight, in relation to their personal attributes, home circumstances, school conditions, academic careers, and employment.
Subjects: 98 "good" and 98 "poor" readers to age 14 and, in some cases, beyond.
Methods: Tests administered in schools; assessments, completed questionnaires, and background data contributed by teachers and officers of cooperating authority; direct observation in classroom; interviews with pupils and teachers; and case studies.
Findings: Even in an area where good reading standards are achieved by majority of children, the prognosis for those who have made little headway with reading by the age of eight is very unfavorable. This can be attributed partly to unsatisfactory schooling.
Duration: 1955-December 1964.
Investigator(s): Joyce M. Morris, Ph.D., Research Officer, National Foundation for Educational Research in England and Wales, 79 Wimpole St., London W.1, England.
Cooperating group(s): Kent Education Authority.
Publication: Findings on poor readers are included in report by investigator of a larger investigation (Bulletin 11, Research Relating to Children) to be published under title, Standards and Progress in Reading. Findings on good readers will probably appear as an article.

19-PD-8 REMEDIAL TRAINING OF FIRST GRADE CHILDREN WITH VISUAL PERCEPTUAL RETARDATION

Purpose: To identify and ameliorate visual perceptual immaturity in first grade children; and to investigate the correlation with early reading progress.
Subjects: 155 first grade children, 97 boys, 58 girls.
Methods: Winterhaven Perceptual Forms Test and Harsh-Soeberg Survey of Primary Reading Development were administered as pre- and post-tests. Half of a group identified as low in visual perception scores, were given the Frostig Training Program for 10 weeks; the other half were not. Pearson Product Moment Correlations, both simple and multiple, and t tests were administered to evaluate statistical data.
Findings: No significant correlation between improvement in visual perception and reading achievement. Experimental group made larger overall gains in visual perceptual performance than did untrained group.
Duration: September 1964-1965.
Investigator(s): Ruth I. Cohen (Ed.D. Candidate), Consultant, Division of Research and Guidance, Los Angeles County Superintendent of Schools Office, Los Angeles, Calif. (Reported by May V. Seagoe, Ph.D., Professor and Associate Dean, University of California, Los Angeles.)
Cooperating group(s): Redondo Beach City School District.
Publication: Abstract will be available in late fall 1965.

19-PD-9 A STUDY OF STORIES IN FIRST GRADE READING MATERIALS

Purpose: To determine and evaluate content of commonly used first grade readers, along dimensions of sex, age, characters, theme and outcome; to evaluate influence of content on motivational interest in reading through testing responses of children to stories; and to cross national comparisons of first grade readers.
Subjects: First grade children in public schools.
Methods: Coding stories along dimensions of content analysis; analyzing coded stories (IBM cards) in terms of frequency distributions and cross correlations; using paired choice comparisons of stories with first grade children.
Duration: September 1963-September 1968.
Investigator(s): Gaston E. Blom, M.D., Professor, Department of Psychiatry, and Richard R. Waite, Ph.D., Assistant Professor of Clinical Psychology, Department of Psychiatry, University of Colorado Medical Center, 4200 E. Ninth Ave., Denver, Colo. 80220.
Cooperating group(s): Project Literacy; National Institute of Mental Health, Public Health Service, and Office of Education, U. S. Department of Health, Education, and Welfare.

19-PG-1 IMAGE OF LATIN AMERICA: A STUDY OF AMERICAN SCHOOL TEXTBOOKS AND SCHOOL CHILDREN, GRADES TWO THROUGH TWELVE

Purpose: To evaluate progress being made in North American elementary and secondary schools toward understanding of Latin America; to discover extent to which national history and social studies testbooks used in North American elementary and secondary schools help students to know and understand Latin America; and to determine understandings that students actually possess about Latin America.
Subjects: Textbook samples included 80 elementary school and 73 secondary school social studies textbooks. In addition, 1247 students, grades 7 to 12, from 13 different school districts in Michigan, Wisconsin, Ohio, and Texas were tested.
Methods: A content analysis was made of 153 elementary and secondary school social studies textbooks. The following Latin American topics were isolated for intensive analysis: Geography, The People, The Colonial Period and Revolutions, Political Development, United States relations with Latin America, Economic Development, and Social Problems and Social Change. A "Test of Understanding of Latin America" consisting of 68 items was administered to subjects. Comparisons were made between grade levels, metropolitan schools, isolated schools, and Mexican border schools; travel/contact with Latin America and no travel/contact with Latin America; and questions relating closely to textbook content and questions not related to textbook content. Analysis of variance used as a test of significance among various groups.
Findings: North American textbook treatment of Latin American topics have shown positive improvement since last major study in 1944, quantitatively adequate but still in need of qualitative improvement. Elementary textbooks, while avoiding controversy, afford a more extensive coverage of Latin America than secondary textbooks. Students have a reasonable knowledge of Latin America. Mean raw scores ranged from 22.66 (34.9 percent) to 26.98 (41.5 percent) for the various groups. Item analysis would suggest that the textbook is highly significant in determining what students know about Latin America.
Duration: May 1964-October 1965.
Investigator(s): Vito Perrone, Ph.D., Assistant Professor of History, Northern Michigan University, Marquette, Mich.
Cooperating group(s): Office of Education, Department of Health, Education,

and Welfare.
Publication: Full report will be released to all who assisted in the project, including the Office of Education, elementary and secondary school teachers, and many school districts across the U.S. Portions of report will be prepared for publication in several educational journals.

Special education

19-QA-1 A COMMUNITY RESOURCE POOL AND ADOLESCENT IMPRESSIONS OF PROFESSIONAL FIELDS

Purpose: To determine effect of seminar work with professional persons upon adolescents' impressions of various professional fields.
Subjects: Academically talented students in grades 7 through 12.
Methods: Subjects are voluntarily attending Saturday seminars conducted by members of community in such varied specialties as painting, architecture, anthropology, oceanography, medicine, television writing, microbiology, city planning, and social psychology. Comparisons in terms of I.Q., achievement test scores, economic status, and similar demographic characteristics are made between seminar students and those not choosing to participate in seminars. Attitudinal statements are developed to assess pupil views on professions.
Investigator(s): Richard M. Clark, and Reuben R. Rusch, Ph.D., State University of New York, College at Oneonta, Oneonta, N. Y.
Cooperating group(s): Office of Research and Evaluation, New York State Education Department.

19-QB-1 STAFF PROJECT FOR UNDERACHIEVERS

Purpose: To test effectiveness of a combined program of group counseling and intensive remedial reading instruction on academic achievement and personality structure of elementary school children who are scholastically retarded.
Subjects: Six fourth grade boys, six fifth grade boys, one fifth grade girl with average I.Q.'s, showing reading retardation of 18 months or more below grade level.
Methods: Subjects administered WISC, Metropolitan Achievement Test (subtests on spelling and arithmetic only), Roger's Test of Personality Development, Informal Reading Inventory, Botel's Word Opposites Test and Phonic Inventory, and Bond-Clymer Hoyt Developmental Reading Test; developmental history obtained from parents; remedial instruction four sessions per week; group counseling sessions once per week during two consecutive school years; conferences with teachers and parents when deemed appropriate; reading specialist met weekly with each psychologist to coordinate program; retest at conclusion of study.
Duration: September 1963-June 1965.
Investigator(s): Audrey Grupe, Ph.D., and Russel Wray, M.A., School Psychologists; and Doris Kissinger, M.A., Reading Specialist, North Shore Schools, Glen Head, Long Island, N. Y.
Publication: To be submitted for publication.

19-QB-2 **CREATIVE ROLE-PLAYING THERAPY AS AN ADJUNCT TO REMEDIAL READING IN THE MODIFICATION OF READING DISABILITY AND THE PSYCHO-SOCIAL MALADJUSTMENT OF PRE-ADOLESCENT BOYS**

Purpose: To evaluate effects of including treatment of aggression and dependency conflicts of underachievers in reading by means of creative role-playing therapy in a remedial reading program. Effects studied were upon amount of growth in reading achievement, growth with respect to adequacy of coping with aggressive and dependency needs, and change in classroom behavior observed in group remedial reading sessions.
Subjects: 29 boys between ages of 9 and 11, of average or better intelligence, with no uncorrected physiological defects, retarded in reading one year or more, and enrolled in a remedial reading program.
Methods: Two matched groups; control group had 40 sessions of remedial reading; experimental group, 20 sessions of reading, 20 of therapy with nonteaching psychotherapist. Therapy consisted of subjects both discussing and acting in semistructured, fictitious, later biographical dramas involving aggression and dependency expression. Aim was to produce catharsis of these pent-up feelings and training in more adaptive and appropriate expression of these needs so they are not expressed in symptom of reading disability. Tests used were Gates Reading Survey, Human Figure Drawings, Lesser Conflict Analysis of Fantasy, and Haggerty-Olson-Wickman Behavior Rating Scale.
Findings: Experimental group made equal progress in reading achievement despite receiving half the remedial sessions of control group. Role-playing therapy was effective in increasing ability to fantasy aggression and cope with same, reducing strength of dependency needs, and reducing amount of problem behavior in remedial reading sessions. Conclusion is that children who are helped, by whatever means, to increase their ability and freedom to release aggression in fantasy are those who made most progress in remedial reading program.
Duration: February-June 1963.
Investigator(s): Donald L. Wiedis, Ph.D., Supervisor of School Psychologists, Bureau of Child Guidance, New York City Board of Education, 362 Schermerhorn St., Brooklyn, N. Y.
Cooperating group(s): Special Reading Services, New York City Board of Education.
Publication: Doctoral dissertation available from University Microfilms, Ann Arbor, Michigan.

19-QB-3 METHODS FOR HELPING CHILDREN DEVELOP BASIC PSYCHOLOGICAL FUNCTIONS NECESSARY FOR SCHOOL LEARNING IN AREAS OF SENSORY-MOTOR FUNCTIONS, PERCEPTUAL ABILITIES, LANGUAGE SKILLS, AND CERTAIN HIGHER THOUGHT PROCESSES WHILE HELPING THEM WITH THEIR EMOTIONAL DEVELOPMENT AND SOCIAL SKILLS

Purpose: To provide efficient training methods and programs to prevent or to remedy learning problems based on deficits in psychological functions as determined by test results.
Subjects: Pilot studies have been and will be conducted on children of ages 3 to 16 years referred to a clinical school because of learning difficulties; etiology includes minimal neurological dysfunctions, emotional disturbances, developmental lags, and others. Cooperative studies with clinics and public school districts include children with cultural deprivation, mental retardation, and children in regular classes.
Methods: Children are evaluated by quantified tests in perception, language, and higher thought processes, as well as standardized academic achievement tests. (A child's sensory-motor development, social adjustment, and emotional development are also evaluated, but not quantified.) Training programs designed to help a child overcome liabilities in the six develop-

mental areas are then instituted. A program's effectiveness is evaluated by post-testing, teacher and parent rating and observation, academic achievement, and kind of school placement.
Findings: Preliminary pilot studies in the clinical school have shown that such programs are effective in helping an educationally handicapped child return to the regular public school program. Reports from public school districts indicate that the program designed to develop visual perceptual abilities is effective in helping various categories of children learn academic subjects and to adjust to the classroom situation.
Duration: 1957-1967.
Investigator(s): Marianne Frostig, Ph.D., Executive Director, Marianne Frostig Center for Educational Therapy, 7257 Melrose Ave., Los Angeles, Calif. 90046.
Cooperating group(s): Various public school districts.
Publication: Frostig, Marianne and Horne, David, The Frostig Program for the Development of Visual Perception, Chicago: Follett Publishing Company, 1964. A Language Training Program Based on The Illinois Test of Psycholinguistic Abilities, by Marianne Frostig (available from author for research purposes only). Frostig, Marianne, "Education of Children with Learning Difficulties," Distinguished Lectures in Special Education," University of Southern California, Summer, 1962. Frostig, Marianne and Horne, David, "An Approach to the Treatment of Children with Learning Difficulties," Special Child Publications, to be published.

19-QD-1 A DEMONSTRATION-RESEARCH PROJECT IN CURRICULUM AND METHODS OF INSTRUCTION FOR ELEMENTARY LEVEL EDUCABLE RETARDED CHILDREN

Purpose: To test efficacy of a specific curriculum and method for instruction of educable mentally retarded children as compared with standard types of programs.
Subjects: Educable mentally retarded children in 21 experimental and 12 comparison classes.
Methods: Teachers in experimental classes have undergone one year of training in curriculum and method. They will teach under supervision for two years. Children will be assessed in terms of growth in achievement and personality development.
Duration: June 1964-May 1967.
Investigator(s): Herbert Goldstein, Ed.D., Professor and Chairman of Special Education, Graduate School of Education, Yeshiva University, 110 W. 57th St., New York, N. Y. 10019.
Cooperating group(s): Public Schools in Bergen County, New Jersey.

19-QD-2 A SPECIAL PROGRAM FOR IN-SCHOOL 15- TO 18-YEAR OLD MARGINALLY RETARDED AND EMOTIONALLY HANDICAPPED YOUTH

Purpose: To help such handicapped youth remain in school until they have reached their true academic potential, or in leaving, are rehabilitated for training or employment.
Subjects: 80 handicapped youth will be selected each year for special services and study by specially designated school personnel. They will be referred to the JEVS Work Adjustment Center for evaluation and personal and adjustment training during a portion of the school day; they will receive special educational services in school during the balance of the day.
Methods: Psycho-social evaluation; individual and group counseling; remediation in a work setting. Schools will modify instructional methods and curriculum in order to improve the motivation of these youth.

Duration: July 1965-June 1969.
Investigator(s): Saul S. Leshner, Ph.D., Executive Director, and George S. Snyderman, Ph.D., Special Projects Coordinator, Jewish Employment and Vocational Service, 1213 Walnut St., Philadelphia 7, Pa.
Cooperating group(s): Philadelphia Board of Education; Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.
Publication: Papers on various aspects of the program will be submitted by staff members to professional journals. Jewish Employment and Vocational Service will prepare progress and other reports which will be available to qualified persons upon request.

19-QD-3 A STUDY AND DEMONSTRATION OF REHABILITATION SERVICES THAT CAN BE PROVIDED FOR EDUCABLE MENTALLY RETARDED YOUTH THROUGH SPECIAL OCCUPATIONAL TRAINING BY USING SCHOOL AND COMMUNITY RESOURCES

Purpose: To establish and test effectiveness of a prevocationally-oriented training program to be developed in secondary special classes for mentally retarded students, integrating resources of school and community.
Methods: School curriculum for students will be built around their occupational experiences, with emphasis on related academic skills and personal development. Abilities and disabilities will be considered in relation to job requirements in order to fit individual to job and follow his job experience as needed. Interviews will be held with parents and employers to help them understand procedures and goals of program.
Duration: January 1964-December 1966.
Investigator(s): Lloyd H. Gillett, Ed.D., Director of Special Education, Eugene School District Number 4, 275 E. Seventh Ave., Eugene, Oreg.
Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.

19-QD-4 EFFECTIVENESS OF INDIVIDUAL INSTRUCTION (ATTENTION) WITHIN A GROUP SETTING

Purpose: To determine if 20 minutes of daily individual instruction within the classroom, given for a period of 15 weeks, will influence development and behavior; and to find out if nature of instruction makes any difference.
Subjects: 20 retarded preschool children attending classes at the school of the Houston Council for Retarded Children.
Methods: Two classes, 8 to 10 children each, divided into equal groups. One group receives 20 minutes of gross motor exercises daily, given individually. The other receives individual help and attention for an equal period of time in other areas of learning.
Duration: January-May 1965.
Investigator(s): Mary Martha Thompson, Ph.D., Director of Training, Houston Council for Retarded Children, Inc., 3410 Montrose Blvd., Houston, Tex. 77006.

19-QD-5 A PLAN FOR REHABILITATION OF THE MENTALLY HANDICAPPED--"A COORDINATED PROGRAM OF SPECIAL EDUCATION AND VOCATIONAL REHABILITATION WITH THE DEKALB COUNTY BOARD OF EDUCATION"

Purpose: To investigate effectiveness of intensive special education and vocational rehabilitation services offered through a team approach upon

secondary school age mentally retarded individuals.
Subjects: Three special education classes with approximately 90 children in DeKalb County Schools of Georgia.
Methods: Georgia Division of Vocational Rehabilitation will provide consultative services to assist in operation of project. Need for a coordinated curriculum balanced between academic and prevocational training will be thoroughly investigated and developed as a means of smoother transition from world of school to world of work.
Investigator(s): Richard H. Bartlett, Consultant, and Mamie J. Jones, Coordinator, Services for Exceptional Children, Division of Instruction, Georgia State Department of Education, State Office Building, Atlanta, Ga. 30334.
Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.

19-QD-6 A COORDINATED PROGRAM OF VOCATIONAL REHABILITATION AND SPECIAL EDUCATION SERVICES FOR THE MENTALLY RETARDED

Purpose: To increase the number of adolescent mental retardates being prepared for employment, through establishment of an organized program for evaluation and training of mentally retarded youth, and an ongoing program of cooperative action between a public school system and a rehabilitation agency.
Subjects: Applicants for project services will come primarily from special classes in the Brockton system and will be approaching termination of their formal training. Individuals who are eligible for vocational rehabilitation services and who fall within age range of 15 to 18 years and I.Q. range of 50 to 80 will be accepted for evaluation.
Methods: Students who are accepted by project will be provided with all necessary medical, psychological, and vocational services. Pertinent data about histories, characteristics, attitudes, and/or behavior of the following groups will be collected and analyzed: previous special class students, successful and unsuccessful project students and their families, and participating agency personnel.
Duration: Not reported-June 1967.
Investigator(s): Dorothy M. Singer, Ed.D., Director of Research and Program Planning, and Francis E. N. DeCapot, Massachusetts Rehabilitation Commission, 296 Boylston St., Boston, Mass.
Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.

19-QD-7 A SELECTED DEMONSTRATION FOR VOCATIONAL TRAINING OF MENTALLY RETARDED YOUTH IN PUBLIC HIGH SCHOOLS

Purpose: To develop procedures for vocational evaluation and training of mentally retarded adolescents by utilizing cooperative concerted efforts of rehabilitation counselors, school administrators, regular class teachers, and special educational personnel. It is expected that through this project one can increase success of rehabilitation of mentally retarded youth.
Subjects: 24 subjects between ages of 15 and 18 are considered experimental. These students are individually matched with a control population on basis of age, sex, intelligence, and socio-economic status.
Methods: Students are enrolled in special education for two or three hours daily and placed in those regular classes within the school that are appropriate to their needs and abilities. When a student appears to be ready for job experiences, he is placed in a series of work samples in the

community designed to provide complete descriptive information of a diagnostic nature about his social skills and abilities as an employee. Following this evaluation he is placed in appropriate training facilities, still in the community, and finally he is involved in permanent placement. Employers participating in evaluation and training portion of project attend monthly employment conferences in which they informally discuss client's present performances and future needs. Experimentals and controls will be compared for "vocational adjustment" at end of project.
Duration: May 1964-August 1967.
Investigator(s): Norris G. Haring, Ed.D., Professor of Education, and Jerry D. Chaffin, Coordinator of Vocational Training and Placement, Medical Center, University of Kansas, Kansas City, Kans.
Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.
Publication: Kansas Teacher, October 1965.

19-QJ-1 A STUDY OF THE EDUCATIONAL VALUE OF PREKINDERGARTEN PROGRAMS FOR SOCIALLY DISADVANTAGED CHILDREN

Purpose: To empirically evaluate effects of prekindergarten experience on later school achievement of lower socio-economic children.
Subjects: Subjects, randomly selected from an urban population, were born in 1961 and show no indication of severe mental retardation; all subjects reside in a home in which main wage-earning parent is in a lower socio-economic category of Warner Scale.
Methods: Treatment I is a conventional prekindergarten program. Treatment II is a prekindergarten with special emphasis on parent education. Control groups are maintained. Experimental and control subjects are randomly assigned.
Duration: October 1964-June 1970.
Investigator(s): Clarence J. Spain, Ed.D., Research Supervisor, and Vito M. Gioia, Ph.D., School Psychologist, Schenectady Public Schools, 108 Union St., Schenectady, N. Y. 12305.
Cooperating group(s): Louis T. DiLorenzo, Chief, Bureau of School Programs Evaluation, New York State Education Department.

19-QJ-2 EFFECT OF PERCEPTUAL TRAINING ON INTELLIGENCE AND ACHIEVEMENT

Purpose: To study effect of three types of training in organization, orientation, and discrimination on gains in intelligence and achievement. Three media were blocks, puzzles, and reading.
Subjects: Four matched groups of 14 Negro third graders and four matched groups of 16 Caucasian third graders.
Methods: Blocks. Children were taught to reproduce multicolored building suggestions accompanying Halsam Products Co. Blockville Set No. 102. Corrective feedback was given for left to right orientation, chronological organization, and color discrimination. Puzzles. Building suggestions used were same as with blocks. Subjects put together 1 x 1 inch puzzle pieces cut up from building suggestions. Reading. Exercises in McCall Crabbs Standard Test Lessons were administered and discussed. A battery of achievement and intelligence tests was administered before and after training.
Findings: Gains in language I.Q. were greatest for reading group; in non-language I.Q., for blocks. Gains in vocabulary greatest for Caucasians receiving blocks, but Negroes receiving reading. Gains in reading comprehension greatest for Caucasian reading group and Negro puzzle group. Puzzle groups, especially Caucasians, made losses on most variables studied.

Gains and losses were not maintained during no-treatment periods. Duration: May 1964-July 1965. Investigator(s): Norman M. Chansky, Ph.D., Associate Professor of Psychology and Education, North Carolina State of the University of North Carolina, Raleigh, N. C. Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare. Publication: Reprints may be obtained from the author.

19-QJ-3 EARLY TRAINING FOR CULTURALLY DEPRIVED CHILDREN

Purpose: To attempt to improve intellectual functioning and personal adjustment of culturally deprived children through special experiences provided for them in 15 or 27 months preceding entrance into first grade and during first year of school. Subjects: Two groups of approximately 20 children each. Methods: Subjects will be provided two and three special summer school experiences of 10 weeks each. Experiences will center around four classes of variables: (1) attitudes toward achievement, which include achievement motivation, persistence, ability to delay gratification, interest in school-type activities, identification with achieving role models, and parent's attitude toward child's achievement; (2) aptitude for achievement, which includes perceptual development, concept formation, and language development; (3) social and personal development; and (4) improvement in general physical condition. A community worker with training in education and sociology works with parents and children during the year to provide materials, reinforcement, and support for children and parents in terms of experimental variables. Psychiatric consultation will be used to enable staff better to provide experiences conducive to emotional growth and also to check on possible effects of planned intervention. Duration: September 1961-August 1966. Investigator(s): Rupert A. Klaus, Ph.D., Associate Professor of Psychology, and School Psychologist, Murfreesboro City Schools; and Susan W. Gray, Ph.D., Professor of Psychology, George Peabody College, Nashville, Tenn. Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-QJ-4 EFFECTS OF A LABORATORY NURSERY SCHOOL EXPERIENCE ON THREE-YEAR OLD CULTURALLY DISADVANTAGED CHILDREN

Purpose: To determine effects of a five month university nursery school experience on I.Q. scores, speech characteristics, and selected behavioral ratings of a group of culturally disadvantaged children. Subjects: 15 culturally disadvantaged children: 7 males, 8 females; 10 Negroes, 5 whites. Methods: Nursery school program is in operation at Child Development Laboratory, University of Illinois. Teaching for readiness in all areas is of prime concern. Goal of program is "learning to learn" with special foci being language development, cognitive development, and parent motivation for achievement for their children. Evaluation will include analysis of pre- and post-testing on Stanford-Binet I.Q. test, Peabody Picture Vocabulary Test, Templin Screening and Diagnostic Articulation Test (50 item), mean length of response and mean of five longest responses, Behavior Rating Scale, and semistructured parent interviews at Laboratory and in home. Findings: Only the P.P.V.T. scores have been analyzed at this time. Group average of 88.6 had increased to 102.4 during three month test-retest

interval. This increase was significant at the .01 level.
Duration: March-August 1965.
Investigator(s): J. P. O'Neill, Ph.D., Assistant Professor of Child Development, and Q. B. Mills, Ed.D., Associate Professor of Child Development, University of Illinois, Urbana, Ill. (Reported by Janice M. Smith, Ph.D., Head, Department of Home Economics, University of Illinois.)

19-QJ-5 EFFECTS OF ENRICHMENT PROGRAMS ON INTELLIGENCE, PERSONALITY, AND ACADEMIC ACHIEVEMENT OF WELFARE RECIPIENT CHILDREN

Purpose: To develop a theoretical basis for development of compensatory programs for "disadvantaged" children.
Subjects: 120 first and second grade rural children, 60 experimental, 60 control; 50 preschool age urban children, 25 experimental, 25 control.
Methods: Study of rural children is a portion of a continuing investigation begun in 1963. Two divergent school environments are being studied to identify practices which contribute to development of children. Study of urban children will compare development of preschool age children (4-year olds) enrolled in an enrichment program with development of children enrolled in no formal program. Numerous variables related to home, school, and community will be examined.
Findings: Welfare children are retarded upon entry to elementary school. This deficit is cumulative in the common elementary school. Welfare children make slight positive gains in an enriched school program (academic achievement, personality, and mental maturity). Enriched programs for welfare children at the elementary school level do not compensate for experiential restriction in infancy and early childhood.
Duration: 1963-indefinite.
Investigator(s): Joe L. Frost, Ed.D., Assistant Professor of Child Development, Iowa State University, Ames, Iowa.
Publication: Frost, Joe L. and Hawkes, Glenn R., The Disadvantaged Child: A Book of Readings, Boston: Houghton Mifflin (in press) 1966.

19-QJ-6 A PRESCHOOL TRAINING PROGRAM FOR CULTURALLY DEPRIVED CHILDREN (EVALUATION OF "HEAD START")

Purpose: To select a group of culturally deprived children and provide them with special enriching materials (Montessori methods).
Subjects: 60 four-year old children, divided into three groups.
Methods: All subjects will be administered an I.Q. test, an inventory of social maturity, and a readiness test. One group will have Montessori type equipment, one will have traditional equipment; control group is not in "Head Start."
Duration: May 1965-June 1966.
Investigator(s): Armas Tamminen, Ph.D., Professor and Head, Department of Psychology, University of Minnesota; and Richard F. Weatherman, Ed.D., Assistant Superintendent, Duluth Public Schools, Duluth, Minn.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

19-QJ-7 PRESCHOOL EDUCATION OF DISADVANTAGED CHILDREN

Purpose: To determine effects of one year of preschool education for disadvantaged children.

Subjects: 21 disadvantaged Negro children, approximately four years of age.

Methods: Subjects attend enriched nursery program for one school year. Program effects on school readiness will be assessed on Gesell Developmental Placement Test.

Findings: Preliminary findings indicate a better rate of readiness development than that expected.

Duration: September 1964-September 1966.

Investigator(s): Sarah S. McCain, M.S., and Thomas K. White, M.S., School Psychologists, Richmond Public Schools, 809 E. Marshall St., Richmond, Va.

Cooperating group(s): Human Development Project, Richmond Public Schools.

Publication: Will be included in final Human Development Project summary; mimeograph will be available at conclusion of study.

19-QJ-8 AN INTER-DISCIPLINARY APPROACH TO IMPROVE DEVELOPMENT OF CULTURALLY DISADVANTAGED CHILDREN

Purpose: To improve culturally disadvantaged children of Alachua County, Florida.

Subjects: Culturally disadvantaged children in Alachua County, Florida, public schools.

Methods: College of Education majors and teaching hospital nursing students will act as participant observers and tutors of selected culturally disadvantaged children.

Duration: September 1964-August 1965.

Investigator(s): Ira J. Gordon, Ed.D., Head, Foundations Department and Professor of Education; Robert L. Curran, Ed.D., Associate Professor of Education; and Donald L. Avila, Ed.D., Assistant Professor of Education, University of Florida, Gainesville, Fla.

Cooperating group(s): Alachua County Public Health Department; J. Hillis Miller Health Center, University of Florida.

19-QJ-9 DEMONSTRATION PROJECT IN PRESCHOOL EDUCATION OF DEPRIVED CHILDREN

Purpose: To develop and field test various methods of intervening with preschool children from disadvantaged backgrounds.

Subjects: Project currently has 600 experimental and 600 control children at nursery, kindergarten, and first grade levels. Subjects attend project schools in seven school districts.

Methods: Language-cognitive preschool program, parent program, social work program.

Duration: September 1963-June 1968.

Investigator(s): Allan S. Hartman, Ed.D., Director; Martin Higgins, M.A., Research Director; and Jeanne Barbour, M.A., Curriculum Specialist, Pennsylvania Department of Public Instruction, Harrisburg, Pa.

Cooperating group(s): Pennsylvania State Department of Public Welfare; cooperating school districts; Ford Foundation.

Publication: Annual reports--September 1964 and October 1965.

19-QJ-10 A MULTIFACETED APPROACH WITH EDUCATIONALLY DISADVANTAGED CHILDREN

Purpose: To help educationally disadvantaged children achieve social, emotional, and educational successes ordinarily not within their level of

expectation, and to demonstrate ways in which home, school, and community can work together to counteract conditions and experiences which may stimulate antisocial behavior.
Methods: Four dovetailing educational approaches: identifying and meeting emotional needs; teaching for critical thinking; identifying and clarifying values; and enhancement of self-percept and self-concept.
Duration: April 1965-April 1966.
Investigator(s): Dr. Laurence Hopp, Department of Curriculum and Instruction, Graduate School of Education, Rutgers, The State University, New Brunswick, N. J.
Cooperating group(s): Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-QJ-11 EAST HARLEM YOUTH EMPLOYMENT SERVICE, INC. YOUTH AND WORK TRAINING PROGRAM - PROJECT GIANT STEP

Purpose: To establish, in a group of school dropouts, attitudes and roles which allow further self-involvement and growth within vocational settings. Program is designed to foster adjustment to real work situations; to stimulate a desire for continued education and training; and to instill positive attitudes toward work in a group characterized by occupational apathy.
Subjects: 90 boys per year, 16 through 18 years of age, who are officially school dropouts, presently unreferrable for employment, and who are free of advanced personality disorders, severe physical handicaps, or present involvement with courts.
Methods: Experimental program maintains a research orientation designed to include individually-determined participation for each youth, varying in duration of enrollment; to provide an extensive exposure to vocational information and counseling, classes in remedial English and arithmetic, opportunities to work under supervised conditions, and a setting in which to rehearse and experience job-related roles.
Duration: 1962-continuing.
Investigator(s): Robert Hougham, Director, Youth and Work Training Program, East Harlem Youth Employment Service, Inc., 2037 Third Ave., New York 29, N. Y. (Reported in Current Projects in the Prevention, Control, and Treatment of Crime and Delinquency, Winter 1964-1965.)
Cooperating group(s): New York City Youth Board; New York State Division for Youth; New York State Employment Service.

19-QJ-12 JOB OPPORTUNITIES THROUGH BETTER SKILLS (J.O.B.S.)

Purpose: To train currently unemployable youths (many functionally illiterate) to reach educational level and develop attitudes needed for employment; to aid them in acquiring vocational skills; and finally, to place them in employment.
Subjects: 1,000 youths.
Duration: July 1963-September 1964.
Investigator(s): Bruce M. Cole, Project Director, 19 South LaSalle St., Chicago 3, Ill. (Reported in Current Projects in the Prevention, Control, and Treatment of Crime and Delinquency, Summer 1964.)
Cooperating group(s): Chicago Boys Clubs; Chicago Youth Centers; YMCA of Metropolitan Chicago; Illinois State Employment Service; Illinois Department of Vocational Education and Rehabilitation; Cook County Department of Public Aid; Chicago Association of Commerce and Industry; Illinois Commission on Youth Welfare; Mayor's Commission on Youth Welfare; Welfare Council; Office

of Manpower, Automation, and Training, and Bureau of Apprenticeship Training, U. S. Department of Labor; Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.

19-QM-1 USE OF INITIAL TEACHING ALPHABET (I/T/A), DEVELOPED BY SIR JAMES PITMAN, IN REMEDIAL READING

Purpose: To determine whether retarded readers of normal intelligence can profit from use of i/t/a after limited or no success with other methods of remedial reading; to determine whether there are any neuropsychologic differences between those children who profit and those who do not profit from such instruction.
Subjects: Children of normal intelligence who are two or more years below grade level in reading and have not shown significant progress with prior remedial reading instruction.
Methods: Subjects were selected at random and referred by several routes for consideration for inclusion in remedial reading program which received limited local publicity during its early stages. Each child was administered a WISC test, neurological exam, and reading achievement test. They were placed in fairly homogeneous groups of seven or eight for instructional purposes. Instruction was given on the average of four days a week for 40 minutes per day. Regular school work was not altered but any other formal remedial reading instruction was arbitrarily terminated. Most of the children in program received instruction for 30 to 45 days.
Findings: Majority of children showed moderate to striking improvement in reading ability. A few showed little or no improvement. Degree of improvement was roughly correlated with severity of neurological abnormalities.
Duration: September 1964-August 1965.
Investigator(s): John B. Isom, M.D., Associate Professor of Pediatric Neurology; Judith Brown, M.A., Research Associate in Pediatrics; and Robert D. Boyd, Ph.D., Associate Professor of Medical Psychology, University of Oregon Medical School, Portland, Oreg. 97201.
Publication: Publication is planned. A preliminary report is to be given at 2nd International Meeting on i/t/a at Lehigh University, Bethlehem, Pennsylvania in August 1965.

19-QM-2 EVALUATION OF A SPECIAL EDUCATION PROGRAM FOR CRIPPLED CHILDREN IN NEW YORK CITY

Purpose: To determine influence of special education classes, located within regular school buildings, on development of children with neuromuscular disabilities; to establish basis for continuation of study in terms of family interaction patterns, personality and mental development (sexual identity, conceptual and creative abilities), follow-up of rejectees, comparisons with nonhandicapped children of presumably equal intellectual potential, and development of new evaluative methods; and to make tentative determination of efficiency of current program.
Subjects: All children placed in program during the period September 1965-January 1966, and to the extent that resources permit, those accepted but put on a waiting list.
Methods: At the beginning, and after intervals of six months and one year, three categories of data will be obtained, as follows: (1) medical/physical status--sensorimotor capacities (by physician); (2) psychological functions--academic achievement, intellectual ability, and emotional and social aspects of personality function (by psychologist); and (3) social--assessment through family interview data (social worker) and observational data (participant-

observers). All data will be gathered in terms of existing tests or modifications of them that are dictated by conditions of testing.

Duration: June 1965-September 1967.

Investigator(s): Harold Jacobziner, M.D., (deceased), formerly Assistant Commissioner of Maternal and Child Health, New York City Department of Health, 125 Worth St., New York, N. Y. 10013. (Reported by Levon Kabasakalian, Ph.D., Medical and Health Research Association of New York City, Inc., Room 720, 40 Worth St., New York.)

Cooperating group(s): New York City Department of Health; New York City Board of Education; United Cerebral Palsy of New York City, Inc.; Office of Education, U. S. Department of Health, Education, and Welfare.

Publication: Findings will be made available, as soon as feasible, through publications and papers presented at professional meetings.

19-QM-3 AUDITORY DISCRIMINATION TRAINING IN THE DEVELOPMENT OF WORD ANALYSIS SKILLS

Purpose: To develop effective self-instructional procedures for testing relationship of auditory discrimination to selected tasks in reading.

Subjects: Approximately 300 kindergarten children with selected backgrounds.

Methods: Experimental study calling for administration of a number of training programs and a study of effects of training upon subsequent learning tasks.

Findings: Work to date has focused upon development of training materials which best exemplify variables associated with auditory discrimination.

Duration: June 1965-December 1966.

Investigator(s): John D. McNeil, Ed.D., Associate Professor of Education, University of California, Los Angeles 24, Calif.

Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

Publication: Monograph to be published.

19-QM-4 USE OF VISUAL MEMORY AND TEACHING WRITTEN COMPOSITION TO DEAF CHILDREN

Purpose: To investigate use of programming as a medium for establishing memory traces for use of function words in language patterns of deaf children.

Subjects: 38 deaf children from intermediate grades of a state residential school for the deaf.

Methods: A program of self-instruction in which prompts were faded leading to recall of units of content material, including selected function words, until subjects could recall and reproduce complete sentences in correct syntax.

Findings: The deaf child can learn correct use of function words through programmed instruction; but once learned, skill should be reviewed and practiced in written compositions.

Investigator(s): Mary Lou Rush, M.S., Research Associate, Department of Speech Science, Ohio State University, Columbus, Ohio.

19-QM-5 EVALUATION OF THE YOUTH TRAINING AND EMPLOYMENT PROJECTS OF THE YOUTH OPPORTUNITIES BOARD OF GREATER LOS ANGELES

Purpose: To describe and evaluate operation of two experimental and

demonstration projects of the Office of Manpower, Automation, and Training of the U. S. Labor Department; and to describe aspects of programs applicable to other areas and to indicate aspects of these programs which demand additional inquiry.
Subjects: 1,000 youth, approximately 50 percent Negro and 50 percent of Mexican-American descent, half of whom have been served by Youth Training and Employment Projects. Eligibility criteria: age 16 to 22, out of school, unemployed, with special employment problems, living in one of two project areas.
Methods: Interviews with youth on precoded schedules; interviews with other interested or concerned individuals in terms of subjects in an outline form appropriate to the individual or agency.
Duration: October 1964-April 1966.
Investigator(s): Paul M. Sheldon, Ph.D., Professor and Chairman, Department of Sociology and Anthropology; Irwin Mahler, Ph.D., Professor and Chairman, Department of Psychology; and E. Farley Hunter, LL.B., Research Consultant, Laboratory in Urban Culture, Occidental College, Los Angeles; and George Fargo, Ph.D., Associate Professor of Educational Psychology, San Fernando State College, Northridge, Calif.
Cooperating group(s): Office of Manpower, Automation, and Training, U. S. Department of Labor.
Publication: Manuscript to be submitted to U. S. Department of Labor in April 1966.

19-QM-6 TEACHING HOMEBOUND PUPILS BY TELEPHONE IN LOS ANGELES

Purpose: To appraise a system by which groups of homebound children are given full-time instruction via telephone. Program provides as nearly as possible the same educational opportunities as are available to pupils able to attend special classes.
Subjects: 26 children with permanent or temporary physical disabilities, expected to be in teleteaching for at least five months.
Methods: Individual study of each pupil; questionnaires for pupils, parents, teleteachers, and teachers of former teleteaching pupils.
Findings: Analysis of semester grade averages indicated that satisfactory educational progress, commensurate with ability, had been achieved by pupils in teleteaching. Parents, pupils, and regular classroom teachers were pleased with results of program. Used in conjunction with television, radio, and programmed instructional materials, teleteaching becomes the next best method to having the child present in school.
Duration: September 1963-November 1965.
Investigator(s): Dorothy B. Carr, Ed.D., Supervisor, Crippled and Delicate, Special Education Branch, Los Angeles City Schools, Los Angeles, Calif. (Reported by Ernest P. Willenberg, Ed.D., Director of Special Education, Los Angeles City Schools.)
Publication: Exceptional Children 31:118-126, November 1964.

19-QM-7 HOME TRAINING PROGRAM FOR DEAF INFANTS

Purpose: To establish and evaluate an educational program to be carried out in homes of deaf children between 7 and 42 months of age.
Methods: Deaf infants up to 42 months of age who have participated in a home training program will be compared with deaf children who have begun formal training at approximately 42 months of age. Comparisons will be made on basis of spectrographic analyses, listener judgments, and standardized tests of psycholinguistic abilities.

Duration: 1964-1968.
Investigator(s): Robert L. McCroskey, Ph.D., Director of Teacher Training, Atlanta Speech School, Inc., 2020 Peachtree Rd., NW, Atlanta 8, Ga.
Cooperating group(s): Division of Chronic Diseases, Public Health Services, U. S. Department of Health, Education, and Welfare.

SOCIAL SERVICES

19-RA-1 CHICAGO CHILD WELFARE COST STUDY

Purpose: To determine uniform costs in institutional care for children, foster care, and adoption service.
Subjects: 36 child welfare agencies in the Chicago area.
Methods: Institutional cost studies, based on adaptation of manual of Child Welfare League of America. Approaches for cost analysis of foster care and adoption to be developed during the two-year project.
Duration: July 1965-July 1967.
Investigator(s): Leroy H. Jones, M.S.W., Director, Welfare Cost Analysis Project, Welfare Council of Metropolitan Chicago, 123 W. Madison St., Chicago 2, Ill. (Reported by Sidney E. Zimbalist, Research Director, Welfare Council of Metropolitan Chicago.)
Cooperating group(s): Community Fund of Chicago; Chicago Community Trust; Frank Woods Charitable Trust; Illinois State Department of Children and Family Service.

19-RA-2 1963 SURVEY OF MOTHER-CHILD BENEFICIARY UNITS UNDER OLD-AGE, SURVIVORS, AND DISABILITY INSURANCE

Purpose: To study the socio-economic situation of widowed mothers and children entitled to survivor benefits under the OASDI program. Particular attention was given to financial situation, living arrangements, health insurance coverage, and employment status of mother-child beneficiary groups as well as to educational attainment, day care patterns, and health care of paternal orphans.
Subjects: Mother-child beneficiary units consisting of an unremarried widowed mother with at least one child under age 18 in her care all of 1962 and who had received an OASDI benefit check in January 1962 or earlier.
Methods: Survey was based on a two-stage national area probability sample of mother-child units selected from a universe of 895,000 survivor families who were receiving social security benefits as of September 1962 and who lived in the conterminous United States, Alaska, and Hawaii. The final sample included 1,068 interviews, representing 416,000 mother-child beneficiary units, conducted in March and April 1963 by the Bureau of the Census, was responsible for collecting and tabulating the data.
Investigator(s): Erdman B. Palmore, Chief, Beneficiary Studies Section, Economic and Social Surveys Branch, Division of Research and Statistics, Social Security Administration, U. S. Department of Health, Education, and Welfare, 6401 Security Blvd., Baltimore, Md. 21235.
Cooperating group(s): Bureau of the Census, U. S. Department of Commerce.
Publication: Analysis of data and survey findings to be presented as a monograph in 1965.

19-RA-3 AN INVESTIGATION OF LEGAL AND SOCIAL WORK PRACTICE IN TERMINATION OF PARENTAL RIGHTS

Purpose: To describe a group of cases that evoke professional intervention of both lawyers and social workers in the effort to evaluate current practice, isolate points of difference and agreement between the two professions in their approach to cases, and explore the basis for more effective communication between social agencies and courts in termination practice.
Methods: Two groups of case records will be examined retrospectively: a sample of termination cases disposed of by Children's Division of County Court of Milwaukee County during 1963; and a sample of current child welfare agency cases that will indicate aspects of agency planning that may or may not eventuate in a subsequent court referral. Reasons for referral or nonreferral will be explored. Data from case records will be supplemented by interviews with court and agency staff as indicated. A later phase of study will explore attitudes of members of both professions toward termination through interviews in depth.
Duration: December 1963-July 1966.
Investigator(s): Alan D. Wade, Ph.D., and Margaret K. Rosenheim, J.D., Associate Professors, School of Social Service Administration, University of Chicago, Chicago 37, Ill.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-RA-4 ANALYSIS OF GAPS IN SERVICE TO MENTALLY RETARDED AS EXPERIENCED BY INFORMATION-CONSULTATION SERVICE FOR THE RETARDED

Purpose: To determine gaps in community services to mentally retarded; to account for these gaps in services in such a way as to indicate who are the agents of the gaps, and what changes should be sought in those agents to eliminate said gaps in service.
Subjects: Persons requesting help in finding service for individual mental retardates.
Methods: Analysis of 300 case records of Information and Consultation Service.
Findings: Requests for help in finding services for mentally retarded persons from suburban counties were higher, from urban counties equal, and from rural counties less than the respective county proportions of the state's total population. However, requests from urban county were much more frequently met than requests from nonurban counties. Types of service most frequently unavailable for retardates were: counseling for problems in interpersonal relationships; education; leisure time and socialization program; and training for employment. Requests were most frequently for retardates in age group five to 10 years, 14 to 20, and 21 and over, in that order. Of these three age groups, the 14- to 20-year olds requests most frequently went unmet.
Duration: August 1963-April 1964.
Investigator(s): Robert R. Mayer, M.S., Research Director, Rhode Island Council of Community Services, Inc., 333 Grotto Ave., Providence, R. I.
Cooperating group(s): Information-Consultation Service for Mentally Retarded; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Report by Rhode Island Council of Community Services, Inc.

19-RA-5 ACCEPTANCE OF CERTAIN YOUTH PROGRAMS AND SERVICES BY RURAL FAMILIES IN NORTH CAROLINA

Purpose: To determine sources from which parents of young children received information and services regarding child care and development; types of information and services regarding child care and development which were received; and types or sources of information and services for which parents of young children express a need.
Subjects: Approximately 450 mothers of children in first six grades in school.
Methods: Data will be collected in tape-recorded interviews with subjects. An interview guide, modified and pretested for this age group, will be used and data will be transcribed onto a data analysis form based on the guide. Data will be coded and punched on cards for machine processing. Frequencies of responses to subclassifications relative to sources types, and information and services desired will be tabulated. Certain demographic variables will be related statistically to subclassifications of information under general headings stated in objectives.
Duration: 1964-1967.
Investigator(s): Irwin V. Sperry, Ph.D., School of Home Economics, University of North Carolina at Greensboro, Greensboro, N. C.
Cooperating group(s): Cooperative State Experiment Station Service, U. S. Department of Agriculture.

19-RA-6 CHILD WELFARE CURRICULUM PROJECT

Purpose: To determine training needs of child welfare workers who do not have a Master's degree in social work; to examine differences between professional and nonprofessional social workers as a basis for developing an intensive short-term resident training program.
Subjects: 30 professional and 30 nonprofessional child welfare workers employed in Wisconsin public agencies.
Methods: Subjects were interviewed to obtain information on their basic career characteristics and job settings, to probe their attitudes toward some of their daily experiences, and to obtain an overall view of the feeling of public child welfare services in Wisconsin. Subjects were also interviewed about two of their cases to gather data on characteristics of case handling. It was assumed that differences between two groups of workers and the way in which they viewed and carried out their jobs could serve as a basis for curriculum development.
Findings: Differences were found between child welfare workers with professional education and those without in their diagnostic frame of reference, their understanding of helping process, their behavior and activities in "intake" and "service" phases of case handling, and in their role orientation and functioning.
Duration: November 1962-September 1965.
Investigator(s): John F. O'Neill, M.A., Lecturer in Social Work, Extension Division and School of Social Work, University of Wisconsin, Milwaukee, Wis.
Cooperating group(s): Division for Children and Youth, Wisconsin State Department of Public Welfare.
Publication: O'Neill, John F. and Pflanczer, Steven I., Profiles in Child Welfare Service: A Study of Differentially Trained Social Workers, Milwaukee: The University of Wisconsin Extention Division, 1965 (in press).

19-RA-7 STUDY OF SOCIAL SERVICES TO FAMILIES AND CHILDREN IN ERIE COUNTY, OHIO

Purpose: To assist citizens of Erie County in the analysis of some of the social problems which face them, and in delineating social needs resulting from these problems. Study is concerned primarily with three serious community problems: delinquency and social maladjustment among children, parental neglect, and poverty-dependency.
Methods: Examination of various community agencies and evaluation of their combined effectiveness in attacking problems of the community.
Duration: March 1963-1964.
Investigator(s): Charles H. Shireman, M.A.; Ray A. Carter; Leonard Voorhees; John P. Kemph, M.D.; and Maurice O. Hunt, M.A., National Study Service, 44 E. 23rd St., New York, N. Y. 10010. (Reported in Current Projects in the Prevention, Control, and Treatment of Crime and Delinquency, Winter 1964-1965.)
Cooperating group(s): Sidney Frohman Foundation; Citizens Committee for Youth Services.

19-RA-8 COST ANALYSIS IN CHILDREN'S INSTITUTIONS

Purpose: To develop a method for computing cost of child care in an institution which would be more meaningful, more accurate, and more comparable from one setting to another than traditional institutional per capita cost.
Duration: 1963-1966.
Investigator(s): Robert Elkin, M.S.W., Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare, Washington, D. C. 20201. (Reported in Current Projects in the Prevention, Control, and Treatment of Crime and Delinquency, Winter 1964-1965.)
Cooperating group(s): Child Welfare League of America; Field Foundation.

19-RD-1 EVALUATION AND ANALYSIS OF GROUP WORK SERVICES

Purpose: To evaluate social group work services offered to deviant students in five public school systems in Michigan.
Methods: In order to measure student change, a control group design is employed, and a series of before-and-after measures, obtained from student questionnaires, from teacher rating forms, and from school records will be analyzed. Changes noted in students treated through group work method will be linked to specific actions engaged in by practitioner with or on behalf of deviant students. To accomplish this objective, practitioners will be interviewed and their records will be examined. Codification of practitioner activities will be completed, and applied to records and interviews. With these two types of data, that pertaining to changes in students in specific areas of school functioning, and that pertaining to practitioner actions directed at improving these particular areas of functioning, it will be possible to relate specific practitioner activities directly to specific changes produced by this method of treatment.
Duration: Not reported-June 1966.
Investigator(s): Maeda J. Galinsky, Ph.D., School of Social Work, University of North Carolina, Chapel Hill, N. C.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-RD-2 REALIZING THE POTENTIAL OF UNDERPRIVILEGED YOUTH

Purpose: To describe currently existing levels of aspirations and achievement among youth of the Negro community and their parents; to determine which forces in the community help or hinder these aspirations; and to establish a baseline against which to measure effectiveness of the action program.
Methods: A comprehensive program of ameliorative activity, creatively involving all of the community resources, will attempt to replace current attitudes of resignation, complacency, and resentment in respect for significance of education and a desire and drive for higher achievement on the part of Negro youth.
Duration: Not reported-1968.
Investigator(s): Richard M. Sax, M.S.W., Executive Director, Contra Costa Council of Community Services, 2717 N. Main St., Suite 9, Walnut Creek, Calif.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-RD-3 SOCIAL CHANGE AS A FUNCTION OF COMMUNITY EDUCATION

Purpose: To mobilize community leadership for developing programs which will reduce youth problems; and to evaluate community and organizational change as well as resultant action programs.
Methods: Program method includes engagement of local residents, high school students, and agency representatives in a data-based community study process. Crenshaw study seminars serve as a baseline for systematic planning and community-based responsibility for implementing action programs. Community study seminars include discussion of data regarding social conditions, youth problems, and available resources throughout community. By questionnaires and interviews, participating organizations are studied for differences in attitudes and organizational structure as well as for long-term change in service allocations. Individual research designs are developed for specific action programs developed by the project.
Findings: Project has led to a number of locally based action programs including pro-school, tutoring, and community youth organization programs. Community education has been increased through news reports, a speaker's bureau, and additional seminar activities. Evaluative designs have been developed for each program.
Duration: March 1964-February 1967.
Investigator(s): Herbert R. Sigurdson, Associate Director, and Donald G. Dodge, Youth Studies Center, University of Southern California, Los Angeles 7, Calif.
Cooperating group(s): Ford Foundation; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Sigurdson, Herbert R.; Dodge, Donald G.; and Shanahan, Patricia A., *Crenshaw Community Study Curriculum*, Los Angeles: Youth Studies Center, 1965. Board of Corrections Monograph No. 4, *Correction in the Community: Alternatives To Incarceration*, Sacramento: Board of Corrections, 1964. (pp. 7-18)

19-RJ-1 NATIONAL STUDY OF ADOPTION

Purpose: To gain long-term, comprehensive information on development of an unselected sample of adopted children. It is hoped to make comparisons not so much with "normal children" as with children who are experiencing other forms of substitute care.

Subjects: Some 250 adopted children drawn from the National Child Development Study (1958 cohort).

Methods: Parents of all the children will be interviewed, making use of a structured schedule.

Duration: March 1965-1967.

Investigator(s): M. L. Kellmer Pringle, Ph.D., Dip. Ed., Director of National Bureau for Cooperation in Child Care, Adam House, 1 Fitzroy Sq., London, W.1, England.

Cooperating group(s): Home Office.

19-RM-1 FOSTER HOME EDUCATIONAL PROJECT

Purpose: To analyze results of a centralized program of foster home recruitment on behalf of public and voluntary child placement agencies in Philadelphia, Delaware, and Montgomery Counties, Pennsylvania.

Subjects: Prospective foster family applicants requesting referral between October 1, 1962 and September 30, 1964.

Methods: Information (number, selected characteristics, and disposition) about all inquiries received by the project were cumulated and analyzed. Course of all referrals to participating agencies was followed from initial inquiry to final disposition by means of periodic inquiries addressed to participating agencies. These data were analyzed in terms of: (1) process factors, e.g., time; (2) agency expectation factors, e.g., number in family, stability of marital relationships; and (3) foster family expectation factors, e.g., amount of board payment.

Findings: Most effective means of recruiting foster homes was found to be a broad base publicity campaign: radio, television, and newspaper stories and spot announcements in continuous and regular flow. Only one out of 16 of the inquirers of the project turned out to be approved as a foster home. Limiting factors include shortages in agency home-finding staffs and low payment to foster parents for care of child.

Duration: October 1962-May 1965.

Investigator(s): Marie E. Costello, D.S.W., Research Associate, Health and Welfare Council, Inc., 1617 John F. Kennedy Blvd., Philadelphia, Pa. 19103.

Cooperating group(s): Seybert Institution; Dolfinger-McMann Foundation.

Publication: Research report available from the Health and Welfare Council, Inc. The combined report of the recruitment program and the research will be published in *Child Welfare*, October, 1965.

19-RM-2 STUDY OF FOSTER FAMILIES AND THEIR PUBLIC IMAGE

Purpose: To investigate various aspects of foster families and foster family life using data already collected by The Health and Welfare Council of Baltimore; to obtain information on the public image of foster care; and to estimate the type and degree of deviance in foster families and to relate attitudes and actions to success as foster parents.

Subjects: 475 foster mothers and 350 foster fathers who answered mail questionnaires; 86 foster mothers who were interviewed; a randomized sample of 163 women who were interviewed in respect to their views of foster care.

Methods: Analysis and correlation of data on personal and social attributes, attitudes, values, child-rearing practices, and family interrelationships.

Duration: 1964-1966.

Investigator(s): Dorothy K. Howerton, Ph.D., Professor, School of Social Work, Boston College, 126 Newbury St., Boston, Mass.

Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-RM-3 SIX YOUNG CHILDREN IN TEMPORARY FOSTER PLACEMENT

Purpose: To study the behavior of six young children (17 to 33 months old) cared for in investigators' home during separation from mother, with some appraisal of their state before and after separation; to collect on interview basis data on larger number of similar subjects cared for by familiar relatives.
Methods: Every effort will be made to mitigate the experience--unlike traditional institutional studies children will not be ill, in strange setting, or subject to multiple nursing. In weeks preceding separation, interchange visits familiarize child with investigators' family and home; during separation, investigators provide continuity of care and direct observation 24 hours a day, supplemented by checklists, etc. After separation, visits are scheduled to check sequelae including child's attitude to former foster parents and to film of separation situations. Filming is done throughout. Social worker does complementary study, based on daily visits to children in care of relatives.
Duration: June 1965-May 1968.
Investigator(s): James Robertson, A.A.P.S.W., Psychoanalyst, and Joyce Robertson, Tavistock Child Development Research Unit, 2 Beaumont St., London, W.1, England.
Cooperating group(s): Grant Foundation.

19-RM-4 FOSTER HOME SURVEY

Purpose: To examine existing foster care program of the Youth Authority's Division of Parole to determine ways of strengthening and augmenting this service; to incorporate these improvements in an experimental design; and to test hypothesis that improved foster care would result in improved parole performance of foster home wards.
Methods: Information of California Youth Authority foster care program and on wards involved is being collected.
Duration: Not reported-1964.
Investigator(s): Keith S. Griffiths, Ph.D., Chief, Research Division; Bertram M. Johnson; Perry Hall; and Abraham Scop, California Department of the Youth Authority, 401 State Office Building No. 1, Sacramento 14, Calif.; and Maurice O. Hunt, M.A., Director, National Study Service, 44 E. 23rd St., New York, N. Y. 10010. (Reported in *Current Projects in the Prevention, Control, and Treatment of Crime and Delinquency*, Summer 1964.)
Cooperating group(s): National Study Service; California Department of Social Welfare.

19-RM-5 SOME FACTORS CONTRIBUTING TO BREAKDOWN OF CHILDREN IN "SCATTERED COTTAGE HOMES"

Purpose: To learn why children placed in cottage homes as an alternative to long-term institutionalization fail to remain there.
Subjects: 46 children, 18 girls and 28 boys, who had been deserted by their parents, were not available for adoption, or failed to settle down in foster homes, were placed in cottage homes of the Children's Welfare and Public Relief Department of Adelaide, Australia. 11 of them, or 24 percent, failed to remain there.
Methods: Case histories, before and during cottage home placement, personality and intellectual scales, and other relevant data concerning this group of failures are being investigated.
Duration: February-May 1964.

Investigator(s): M. O. Oswald, Children's Welfare and Public Relief Department, Box 39, Rundle Street P. O., Adelaide, S. A., Australia. (Reported in Current Projects in the Prevention, Control, and Treatment of Crime and Delinquency, Summer 1964.)

19-RP-1 BOSTON DIVISION OF CHILD GUARDIANSHIP DAY CARE PROJECT

Purpose: To assess motivations and decision-making process in families requesting day care for children under the age of three in the Boston area; and to determine what types of services are requested.
Subjects: 75 families who either have already or are planning to use day care.
Methods: A single diagnostic, semistructured interview done in the home by an experienced caseworker. Mothers are usually seen alone.
Findings: Cross section of community, white and Negro, wide range of income and education, with high proportion requesting day care for child under a year old. Considerable interest in counseling, both intake and ongoing, plus possibility of family and small group day care.
Duration: June 1964-August 1965.
Investigator(s): Jane L. Warner, M.S.S.S., M.Ed., Director of Day Care Project, Boston Children's Service Association, 1-3 Walnut St., Boston 8, Mass. (Reported by Constance Rathbun, Director of Research and Training, Boston Children's Service Association.)
Cooperating group(s): Division of Child Guardianship, Boston Department of Public Welfare.
Publication: Results will probably be mimeographed and available on request.

19-RP-2 CHILD DAY CARE ARRANGEMENTS OF MOTHERS WORKING IN INDUSTRY IN THE BALTIMORE AREA

Purpose: To provide information on types of child day care arrangements made by mothers working in the Baltimore area; to supplement information from another day care study on administration, licensing, and availability of child day care facilities in Maryland, in cooperation with Governor's Commission To Study Child Day Care in Maryland.
Subjects: 1,651 working mothers employed in 35 private industries, state agencies, and a large federal agency.
Methods: Use of questionnaire distributed through employers on a voluntary, anonymous basis. Questionnaire kits included a self-addressed, stamped return envelope. Because of voluntary, anonymous participation, no follow-up was possible and the return from 1,651 full-time working mothers represented 33 percent of the 5000 questionnaires distributed.
Findings: 34.5 percent of working mothers depended on their families for child day care; 12.7 percent on friends and neighbors; 16.1 percent on paid baby sitters; 9.1 percent on husbands working opposite shift; and 6.3 percent on day care centers. Only 104 of 1,651 mothers used day care centers. Professional women favored day care centers most; service industry workers the least. Weekly salaries ranged from $114.81 for professional women to $65.16 for service industry workers.
Duration: February 1964-February 1965.
Investigator(s): Joseph M. Szuleski, M.A., Research Analyst, Maryland State Planning Department, 301 W. Preston St., Baltimore 1, Md.
Cooperating group(s): Maryland State Department of Public Welfare.
Publication: Limited supply of studies is available.

19-RS-1 CHILDREN OF MENTALLY ILL PARENTS IN DEPRIVED AREAS

Purpose: To demonstrate values of intensive casework services in families with emotionally ill mothers in relation to adequate child care; to compare a group of families provided intensive casework services with those where such services were not offered to families; and to analyze impact of emotional illness of mother on physical and emotional health of children.
Subjects: 120 families in which the mother was seen by psychiatrists in emergency rooms of Boston City Hospital or Massachusetts General Hospital.
Methods: Two groups of cases will be studied: (1) demonstration families where intensive social casework services will be offered and provided continuously for a period of one year to families in which the mother has been emotionally ill in order to determine best child care planning for the children; and (2) control families where no additional casework services will be offered but where problems in child care will be studied through research interviews. Research interviews three times in the study year will be carried out by social caseworkers to determine problems in the family, especially in relation to needs of children. Results of research interviews of problems in demonstration families will then be compared in control families.
Duration: January 1965-December 1967.
Investigator(s): Elizabeth P. Rice, M.S., Associate Professor of Social Work in Public Health, and Leo Miller, Ph.D., Research Associate in Social Work, School of Public Health, Harvard University, 55 Shattuck St., Boston, Mass. 02115.
Cooperating group(s): Boston City Hospital, Department of Psychiatry; Massachusetts General Hospital, Department of Psychiatry; North Suffolk County Mental Health Center, East Boston; Boston Public Welfare Department.
Publication: Findings will be published and compared with two previous studies of child care needs of mentally ill parents.

19-RS-2 A STUDY OF CHILDREN'S SERVICES IN CALIFORNIA

Purpose: To develop throughout the State, comprehensive and consistent services for protection and care of the neglected child or the child showing early signs of social maladjustment. Special attention will be given to steps necessary to improve care in the child's own family, as well as in various forms of foster care.
Methods: Extensive field work and other fact-gathering methods will be used to secure a statewide picture of needs of neglected children and services now available. These facts will be weighed against range of services commonly accepted as desirable for an effective child welfare program. Recommendations will be developed for a plan for development of a comprehensive pattern of service throughout the State.
Duration: March 1964-June 1965.
Investigator(s): Maurice O. Hunt, M.A., Director, National Study Service, 44 E. 23rd St., New York, N. Y. 10010. (Reported in *Current Projects in the Prevention, Control, and Treatment of Crime and Delinquency*, Winter 1964-1965.)
Cooperating group(s): State of California.

19-RT-1 IMPACT OF RECENT LEGISLATION ON CHILD ABUSE IN SELECTED MIDDLE-ATLANTIC STATES

Purpose: To examine, on an exploratory basis, the impact of recently enacted legislation in a number of Middle-Atlantic States on identification of abused children and on effectiveness of services in their behalf.

Subjects: Official and voluntary agencies in selected Middle-Atlantic States--Pennsylvania, New Jersey, Massachusetts, Connecticut, and New York; and all registered cases of child abuse under the new law in New York City from July 1, 1964 to July 1, 1965--over 300 cases.
Methods: Interviewing professional staff of responsible service agencies in the five selected states, to provide descriptive background of statewide experience in the region under different administrative and legal patterns; abstracting information from records of all cases of child abuse registered in New York City during the first 12 months under the new legislation, to describe epidemiologic and demographic characteristics of families involved and administrative patterns which have evolved in handling the cases.
Duration: April 1965-1966.
Investigator(s): Elinor F. Downs, M.D., M.P.H., Assistant Professor of Public Health Practice, and Betty Simons, M.D., M.P.H., Assistant in Public Health Practice, School of Public Health and Administrative Methods, Columbia University, 600 W. 168th St., New York 32, N. Y.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-RT-2 EPIDEMIOLOGIC STUDY OF CHILD ABUSE--DEVELOPMENTAL PHASE

Purpose: A multiphased nationwide study of child abuse. Initial phase will investigate cases of child abuse reported in states having mandatory reporting legislation. Subsequent phases of research will investigate cases of child abuse not reported through mandatory reporting systems. Last phase will assess effects of community measures in treatment and prevention of child abuse.
Methods: National survey, gathering and analysis of news clippings, interviews, community relations activities on national, state, and local levels, etc.
Duration: June 1965-indefinite.
Investigator(s): David G. Gil, D.S.W., Assistant Professor, Florence Heller Graduate School for Advanced Studies in Social Welfare, Brandeis University, Waltham, Mass. 02154.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-RT-3 A STUDY OF NEGLECT AND ABUSE OF CHILDREN AFTER PROTECTIVE SERVICE

Purpose: To evaluate the effectiveness of alternative programs of service intended to reduce the recurrence of neglect and abuse of children in families known to protective service agencies.
Subjects: Families previously served in an intensive service project and selected samples of contrast population.
Investigator(s): Harold Lewis, D.S.W., Professor of Social Research, and Julius A. Jahn, Ph.D., Professor of Social Research and Director, Research Center, School of Social Work, University of Pennsylvania, 2410 Pine St.; and Julia Ann Bishop, Executive Director, Philadelphia Society to Protect Children, Philadelphia, Pa.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-RT-4 A PROTECTIVE SERVICES CENTER TO PROVIDE A RANGE OF SERVICES FOR FAMILIES IN WHICH CHILDREN ARE NEGLECTED OR ABUSED

Purpose: To demonstrate the effectiveness of an integrated approach in providing the varied services needed by families in which children are neglected or abused; and to develop new treatment approaches through using combinations of professional skills and by training nonprofessional personnel to work with children and parents.
Investigator(s): Marion J. Spasser, Project Director; Barbara Rocah, M.D., Psychiatric Consultant; and G. Lewis Penner, Executive Director, Juvenile Protective Association, 12 E. Grand Ave.; and Mary Sullivan, Associate Professor, Jane Addams Graduate School of Social Work, University of Illinois, Chicago, Ill.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-RT-5 STUDY OF CHILD PROTECTIVE SERVICES

Purpose: To study child protective services offered by public welfare departments on behalf of children in their own homes who are subjected to parental neglect and abuse and whose parents do not voluntarily seek help.
Methods: A combination of structured instruments, analysis of documents, focused interviews, and direct observation.
Investigator(s): Andrew Billingsley, Ph.D., Assistant Professor, School of Social Welfare, University of California, Berkeley, Calif.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-RX-1 DIAGNOSIS AND CORRECTION OF EDUCATIONAL DISABILITY

Purpose: To determine educational deficits of children in foster home and residential care, and to correct these deficits through remedial tutoring.
Subjects: All school-age children in care of Association for Jewish Children in Philadelphia who are failing in one or more subjects, or who, in standard achievement tests, are significantly under grade level.
Methods: Extensive psychological and achievement testing; diagnosis of learning problem; and corrective measures through tutoring and collaboration with school teachers and counselors.
Duration: September 1963-August 1965.
Investigator(s): Olive John Morgan, Ph.D., Chief Psychologist, Association for Jewish Children of Philadelphia, 1301 Spencer St., Philadelphia 41, Pa. (Reported by Joseph L. Taylor, M.S.W., Executive Director, Association for Jewish Children of Philadelphia.)
Publication: Article for Child Welfare.

19-RX-2 A MUTUAL FAILURE OF LAW AND PSYCHIATRY: THE "CHILDREN IN LIMBO" BETWEEN CLINIC AND COURT

Purpose: To define causative factors which contribute to "child in limbo" problem; to generate "solution-seeking" ideas leading to possible avenues of clinical and/or community action; and to raise definitive questions for research.
Subjects: Predelinquent children referred from court and its agencies to

Child Guidance Clinic, and also those children referred from Clinic to court.
Methods: Records of Clinic over past ten years are reviewed and analyzed for causes of deficits in community service given to these children and their families. Cases are categorized in an attempt to find common characteristics of group, basis for refusal of service, and causative social or community factors which contribute to it. Ideas for action toward a possible solution are set forth as well as questions raised for future research.
Findings: In analyzing surface reasons for agency refusal of service, namely legal eligibility by court, clinical and/or client motivation by clinic, it appears these reasons are often defensive rationalizations for other more basic issues underlying "child in limbo" problem. These more basic issues are: (1) the philosophic differences between a "voluntary" and "involuntary" agency, reflecting culturally entrenched dichotomous idea that badness needs force and punishment, and sickness needs tender loving care; (2) the tendency for each agency to view the other with suspicion, distortion, and disappointment regarding the other's role and function; and (3) the tendency toward agency "procedure rigidity" in their respective service functions.
Investigator(s): Morris Weiss, M.D.; F. Robert Wollaeger, M.A.; and Eleanor Keys, Oakland Child Guidance Clinic, 113 Franklin Blvd., Pontiac, Mich.

19-RX-3 SYRACUSE SCHOLASTIC REHABILITATION RESEARCH PROJECT

Purpose: To clarify impact of various roles of the mental health specialist within the school setting upon the child's total school adjustment patterns.
Subjects: 60 emotionally handicapped children in grades one through six.
Methods: Roles to be compared for effectiveness are: clinician consultation with the child's teacher, regular clinician-child counseling sessions, clinician counseling sessions with the child's parents, and combinations of the above. Subjects will be divided between regular and special classes with a control group of disturbed children receiving no clinician "treatment." Dependent variables of child adjustment for which instruments have been adapted or developed include academic adjustment, behavioral deviation, group interaction, peer and self valuation.
Duration: 1964-1966.
Investigator(s): Sherwin S. Radin, M.D., School Psychiatrist; Sherwood B. Chorost, Ph.D., Clinical Psychologist; and Gene L. Cary, M.D., Assistant School Psychiatrist, Syracuse City School District, 409 W. Genesee St., Syracuse, N. Y.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-RX-4 INSTITUTIONALIZATION OF CHILDREN

Purpose: To investigate whether there is such a thing as the "institutionalized child" with specific personality characteristics; to ascertain when and on what basis children should be returned home or "de-institutionalized;" to demonstrate intake service for children referred to two experimental local welfare offices for institutional placement; to develop services in the community as alternatives to placement; to compare these demonstration results with results of normal ongoing intake procedures in two control welfare agencies; and to demonstrate how specific children are selected for return home from institutions, the kind of service which must accompany this process, and how these children turn out.

Subjects: Dependent and neglected Israeli children, one day to 14 years of age.
Duration: January 1962-January 1966.
Investigator(s): Lester D. Jaffe, D.S.W., Research and Teaching Fellow in Social Work, Paul Baerwald School of Social Work, Hebrew University, Jerusalem, Israel.
Cooperating group(s): Israel Ministry of Social Welfare; Paul Baerwald School of Social Work, Hebrew University; Welfare Administration, U. S. Department of Health, Education, and Welfare.

HEALTH SERVICES

19-SA-1 CHILDREN'S HEALTH STUDY

Purpose: This is an extension of a special AFDC project of families on the welfare rolls of Texas State Department of Public Welfare.
Subjects: 280 children under 16 years of age residing in Houston and Harris county, Texas, whose parents are on the welfare rolls.
Methods: Medical history, physical examination, laboratory reports of a well group of children living under conditions of poverty, to determine prevalence and extent of acute and/or chronic health conditions. Physical examinations conducted by a team of doctors from Baylor University College of Medicine.
Duration: January 1965-unknown.
Investigator(s): Abbie C. Whidden, Executive Director, Visiting Nurses Association, 2616 S. Calumet, Houston, Tex. (Reported by Russell Lokkeberg, Research Director, Community Council, 215 Main St., Houston.)
Cooperating group(s): Baylor University College of Medicine; Community Council of Houston and Harris County; Texas State Department of Vocational Rehabilitation; Texas State Department of Public Welfare.

19-SA-2 PATTERNS OF HEALTH CARE AMONG LOW-INCOME FAMILIES

Purpose: (1) To describe actual health status and patterns of utilization of medical services as they existed at time of first contact with families in sample; (2) to introduce a change in health care by offering and delivering for three years a comprehensive pediatric care program to a randomly selected subsample; (3) to study acceptance and rejection as well as utilization of this program as to their forms, extent, and correlates, by families in subsample; and (4) after delivering this comprehensive program, to make a comparative analysis of its effects as observable in morbidity, utilization of services, health attitudes, and knowledge.
Subjects: About 900 low income Boston families.
Methods: Longitudinal survey research, using repeated interviews with mothers and collection of morbidity data from independent sources.
Duration: July 1962-June 1969.
Investigator(s): Joel J. Alpert, M.D., Instructor, and John Kosa, Ph.D., Research Associate, Family Health Care Program, Medical School, Harvard University, 83 Francis St., Boston, Mass. 02115.
Cooperating group(s): Commonwealth Fund; Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.
Publication: Various articles and papers in preparation and in press.

19-SA-3 TEMPORAL INTERRELATIONSHIPS BETWEEN CLINICAL BACTERIOLOGICAL AND IMMUNOLOGICAL EVIDENCES OF INFECTION WITH GROUP A BETA HEMOLYTIC STREPTOCOCCI

Purpose: To determine time relationship between clinical, bacteriological, and immunological evidences of infection as a guide to potential of prevention of rheumatic fever; and to determine influence of socio-economic status

on relationships of the above nature.
Subjects: 604 children enrolled in a single elementary school in Dade County, Florida, were canvassed for permission to have them participate in project. 320 gave permission.
Methods: Monthly studies were carried out for routine throat culturing; blood samples were collected at beginning and end of school year. In addition, a surveillance was maintained on daily absence and additional blood and throat samples were collected on absentees. Also each family of the 604 children was visited by a field social worker to determine socio-economic status on basis of the Hollingshead criteria.
Findings: Average carrier rate of group A beta hemolytic streptococci was 14.8 percent almost identical with rate previously obtained in Miami area. In the presence of respiratory illness sufficient to cause absences, this rate rose to 15.7 percent. High socio-economic status (Classes I and II) reflected an average illness rate; Class III, a rate above expected; Class IV, significantly below; and Class V, average. Significantly lower respiratory illness rate was observed among school children living in crowded conditions.
Duration: September 1964-September 1965.
Investigator(s): Milton S. Saslaw, M.D., Director, Division of Research and Epidemiology, Dade County Department of Public Health, 1350 NW 14th St., Miami, Fla. 33125.
Cooperating group(s): Dade County Board of Public Instruction; Florida Heart Association; Wyeth Inc.; Norwich Chemical Co.; Heart Disease Control Program, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-SA-4 HIRADO HEALTH SURVEY

Purpose: To ascertain: effect of consanguinity upon reproductive performance of a marriage; reproductive performance of the inbred individual; and certain characteristics of children born to parents, especially mothers, who are themselves products of consanguineous marriages.
Subjects: All children of middle-school age on Hirado (Nagasaki-ken, Japan), except for those attending middle school located in Hirado Machi itself; in all, some 1500 children were studied, as well as their parents. Reproductive performance was ascertained for all marriages where one or both spouses are still alive and residing on Hirado.
Methods: Methods involve physical examinations of children of middle-school age with particular emphasis upon hearing and vision. Similar tests modified somewhat to take into account age differences were conducted on parents. Individuals selected for study represent all children of middle-school age in a population of some 20,000 individuals. Fertility information was obtained from an island-wide census.
Duration: May 1964-September 1966.
Investigator(s): James V. Neel, M.D., and William J. Schull, Ph.D., Professors of Human Genetics, University of Michigan, Ann Arbor, Mich.
Cooperating group(s): Tokyo Dental and Medical University; Kyoto Prefectural University of Medicine; Kyushu University; Atomic Energy Commission.

19-SA-5 SOCIO-ECONOMIC CHARACTERISTICS RELATED TO HEALTH INDICES IN CHICAGO AND SUBURBAN COOK COUNTY, PART I: MATERNAL, INFANT, AND PRESCHOOL CHILD HEALTH SURVEY

Purpose: To survey problems in area of maternal, infant, and preschool child health to provide a factual base for future development and

strengthening of programs.
Methods: Organization and processing of available data to match geographic units of concern; classification of areas into socio-economic and health units.
Findings: Mortality rates vary according to economic status. There is a definite inverse relationship between infant mortality and income. The inverse relationship is not as clear for child and maternal mortality. Prematurity and illegitimacy rates are strikingly inverse in relationship to income. Racial differences are primarily economic differences.
Duration: May 1964-July 1966.
Investigator(s): Jean E. Bedger, M.A., Research Associate, Health Project, Welfare Council of Metropolitan Chicago, 123 W. Madison St., Chicago, Ill. 60602.
Cooperating group(s): Illinois State Department of Public Health; Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.
Publication: Publication of Part I in September 1965.

19-SA-6 DEVELOPMENT OF A RESEARCH DESIGN TO EVALUATE THE EFFECTIVENESS OF A PEDIATRIC OUTPATIENT DEPARTMENT IN THE PROVISION OF MEDICAL CARE

Purpose: (1) To develop a research design to quantify services of an outpatient department; (2) to define and seek methods of measurement of community need and availability of services; (3) to find methods of evaluation of motivation of patients for follow-up care and to determine major obstacles in preventing continuity of care; (4) to determine necessary organization of facilities and specialized manpower for most effective use of time and space in providing largest amount of good service; (5) to assess existing knowledge in these areas and determine that which is applicable in improvement of patient care; and (6) to demonstrate that a systems approach to a complicated logistical problem with many variables will present a method of measurement and research of the effectiveness of clinical care facilities.
Investigator(s): Robert J. Meechan, M.D., Associate Professor of Pediatrics, Medical School, University of Oregon, 3181 SW Sam Jackson Park Rd., Portland, Oreg. 97201.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-SA-7 DEVELOPMENT OF PLANS FOR A LONG-RANGE CHILD DEVELOPMENT AND MEDICAL CARE STUDY PROGRAM

Purpose: To prepare for a long-range, multidisciplinary, comprehensive, coordinated child development and health study and care program, in order to define, anticipate, prevent, detect promptly, and correct, when necessary, conditions which now appear to be resulting in development of essentially irreparable physical, intellectual, and/or psychological disabilities in a considerable proportion of American children.
Methods: Major physical, intellectual, and socio-psychologic component parts of the problem will be defined and then reassembled and integrated into whole units designed to fulfill overall needs of children and their families in an intelligently balanced manner.
Investigator(s): Nathan B. Talbot, M.D., Charles Wilder Professor of Pediatrics, Medical School, Harvard University, and Chief, Children's Service, Massachusetts General Hospital; M. Grace Hussey, M.D., Massachusetts State Department of Health; John P. Connelly, M.D., Chief, Ambulatory

Division, Children's Service, Massachusetts General Hospital, and Associate in Pediatrics, Medical School, Harvard University; and John Robinson, M.D., Clinical and Research Fellow, Massachusetts General Hospital, and Research Fellow, Medical School, Harvard University, Boston, Mass.

Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-SD-1 VISION SCREENING AT THE INDIANA STATE FAIR

Purpose: To determine incidence of vision anomalies of all sorts at all ages.

Subjects: Children aged 5 to 20 constitute 75 percent of the traffic screened with a total of approximately 3,500 a year.

Methods: Keysort punch cards are used to analyze data. Booth is free; results are given to each person.

Findings: Surprising agreement with results of the California "Orinda Study."

Investigator(s): Merrill J. Allen, Ph.D., Professor of Optometry, Indiana University, Bloomington, Ind.

Cooperating group(s): Indiana Optometric Association.

19-SD-2 DEVELOPMENT OF A VISUAL MOTOR TEST FOR YOUNG CHILDREN

Purpose: To develop a test for evaluating deviations in visual motor functioning during the developmental process and at earlier levels than is possible with presently available tests.

Subjects: A diverse group of children: normal, retardates, brain-damaged, and psychotic.

Methods: Administration of test to 400 children, ages five to eight, and Stanford-Binet to half of the subjects. Test was also re-administered to 22 children who last year gave deviant errors; five are still doing so, and will be followed for at least another year. Data have also been gathered on 100 of contemplated total sample of 300 retardates and brain-damaged subjects in the course of their psychological evaluations. Fourteen residential centers throughout the country are cooperating in collection of data on psychotic children.

Duration: October 1963-continuing.

Investigator(s): Mary R. Haworth, Ph.D., Associate Professor of Medical Psychology and Senior Clinical Psychologist, Children's Service, Nebraska Psychiatric Institute, University of Nebraska College of Medicine, Omaha, Nebr. 68105.

19-SD-3 PROTEINURIA IN CHILDHOOD

Purpose: To determine prevalence and characteristics of proteinuria in school-aged children; to determine pathological characteristics of children who are spilling significant amounts of protein in their urine.

Subjects: 5,000 normal school-aged children between 5 and 16 years of age in a suburban area of Los Angeles.

Methods: Initial screening is done by means of a test tape. Children who are positive on screening have a 24-hour urine collection and analysis for protein. These children are then divided into persistent proteinuria,

orthostatic proteinuria, and intermittent proteinuria. Each of these experimental children is then matched with a control child. Experimental and control child each have a complete medical history and physical examination. Renal biopsies are being performed on a number of experimental group.
Findings: Roughly six percent of subjects show initial proteinuria on screening. Of these, approximately half are found to have persistent proteinuria. Of those with persistent proteinuria there is a family incidence beyond that which would be expected. Other results are pending.
Duration: September 1963-September 1967.
Investigator(s): Marsden G. Wagner, M.D., Assistant Professor of Pediatrics and Public Health; Fred G. Smith, Jr., M.D., Assistant Professor; and Neil N. Litman, M.D., Associate Clinical Professor, University of California, Los Angeles 24, Calif.
Cooperating group(s): National Institute of Arthritis and Metabolic Diseases, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: No publications as yet. It is anticipated that initial publication will appear near the end of 1965 as a single article in a pediatric or medical journal; other single articles are expected to appear later.

19-SD-4 DETECTION OF METABOLIC AND OTHER INHERITED DISEASES IN CHILDREN

Purpose: To evaluate efficacy of screen tests in detecting metabolic and other diseases in a children's hospital population (both inpatient and outpatient) before development of complete clinical syndrome.
Methods: Screen tests which will be studied are those employing filter paper chromatography of blood and urine specimens which have been collected by absorption onto filter paper and stored in same state.
Investigator(s): Park S. Gerald, M.D., Assistant Professor of Pediatrics; Joseph L. Kennedy, Jr., M.D., Research Fellow in Pediatrics; and Francis X. Fellers, M.D., Assistant Professor of Pediatrics, Medical School, Harvard University, and Children's Hospital Medical Center, 300 Longwood Ave., Boston 15, Mass.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-SG-1 STEREOPSIS THRESHOLD IN ELEMENTARY SCHOOL CHILDREN

Purpose: To determine prevalence of stereopsis and reasons for its failure to develop when absent.
Subjects: School children in elementary schools in southern Indiana.
Methods: Data are obtained during routine school vision screening tests carried out by the Division of Optometry.
Findings: Stereopsis appears to be all or none in nature. Gradations in stereopsis are usually caused by lack of refinement in correction of refractive error or by muscular imbalances of significant amount.
Duration: 1960-1965.
Investigator(s): H. W. Hofstetter, Ph.D., Director, Division of Optometry, Indiana University, Bloomington, Ind. (Reported by Merrill J. Allen, Ph.D., Professor of Optometry, Division of Optometry.)
Publication: Journal of the American Optometric Association 33:7:510-512, February 1962.

19-SG-2 CALIFORNIA JOINT STUDY OF STUDENT HEALTH PROBLEMS AND SCHOOL PERFORMANCE

Purpose: To explore relationships between health characteristics (or groups of them) and elements of school performance (or groups of them).
Subjects: Pupils from kindergarten, grades one, five, and nine.
Methods: Health examinations and evaluations of pupils and appraisal of school records evaluated by correlation matrices, factor analysis, analysis contingency tables and multiple regression analysis.
Duration: October 1963-unknown.
Investigator(s): B. Otis Cobb, M.D., Assistant Professor of Health Education, Stanford University, Palo Alto, and Director, California Joint Study of Student Health Problems and School Performance, 1933 Delaware St., Berkeley, Calif. 94709.
Cooperating group(s): Dairy Council of California.
Publication: Paper describing study read before 92nd Annual Joint Session of American Public Health Association and American School Health Association.

19-SG-3 A DEMONSTRATION AND RESEARCH PROGRAM IN HEALTH NEEDS AND HEALTH CARE OF CHILDREN IN DAY CARE

Purpose: To determine what health problems are related to or influenced by group care, and what program of health supervision can provide optimal health care with most efficient utilization of health personnel.
Subjects: Children from infancy through elementary school age enrolled in a child development center being organized at the University of North Carolina, and a control group of children in the community.
Methods: Subjects will be given comprehensive health care. Control groups will be given limited health care, and will allow for some control of variables in various studies to be undertaken.
Investigator(s): Sidney S. Chipman, M.D., Professor, and Ann DeHuff Peters, M.D., Associate Professor, Department of Maternal and Child Health, University of North Carolina, Chapel Hill, N. C. 27515.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-SJ-1 STUDY TO DETERMINE APPLICATION OF DENTAL CARIES ACTIVITY TESTS IN ESTABLISHING PRIORITIES FOR PREVENTIVE DENTAL PROGRAMS

Purpose: To determine feasibility of using caries activity tests in establishing priorities of effort in conducting topical fluoride programs. It is anticipated that those children with high dental caries activity and minimal dental damage will receive high priority in a topical fluoride program. Those with high caries activity and extensive damage would receive a lower priority for preventive programs but a high priority for treatment programs.
Subjects: 1,000 school children.
Methods: Saliva samples obtained from subjects; individual caries activity and susceptibility determined by use of caries activity tests. Using a simplified dental survey technique such as screening by tongue blades, extent of previous dental damage is determined. By comparing dental caries activity and susceptibility with past dental damage, priorities for preventive programs and treatment programs are established.
Duration: Summer 1963-unknown.
Investigator(s): Robert Q. Ingraham, D.D.S., Dental Officer; Lucile B. Jarratt, M.P.H., Dental Hygiene Consultant; and Kent T. Roark, B.S., Associate Laboratory Director, Tennessee State Department of Public Health,

BEST COPY AVAILABLE

Cordell Hull Building, Nashville, Tenn. (Reported by A. H. Trithart, D.D.S., M.P.H., Director, Division of Dental Health, Tennessee State Department of Public Health.)

Cooperating group(s): Decatur County Health Department; Decatur County Department of Education; Tennessee Department of Public Health.

19-SJ-2 EFFECT OF TOPICALLY APPLIED ACIDULATED PHOSPHATE-FLUORIDE ON DENTAL CARIES EXPERIENCE

Purpose: To determine efficacy of an acidulated phosphate-fluoride solution in controlling dental caries when applied topically to teeth of school children.

Subjects: Approximately 1,200 school children in the State of Hawaii, enrolled in grades five and six.

Methods: Children were divided into four comparable study groups. Group A annually receives a prophylaxis; Group B annually receives a prophylaxis followed by a topical application of a phosphate-fluoride solution; Group C receives semiannually the same treatment prescribed for Group B; and Group D receives annually a prophylaxis followed by a topical application of a phosphate-fluoride gel. Clinical dental examinations are conducted annually. Dental caries increment for each group is tabulated and evaluated statistically.

Duration: February 1965-February 1968.

Investigator(s): Herschel S. Horowitz, D.D.S., M.P.H., Chief, Research and Development Section, Disease Control Branch, Division of Dental Public Health and Resources, Public Health Service, U. S. Department of Health, Education, and Welfare, 8120 Woodmont Ave., Bethesda, Md.

Cooperating group(s): Hawaii State Department of Health.

Publication: Paper will be submitted for publication in appropriate professional journal and may be presented at a national dental meeting.

19-SM-1 THE EFFECTS OF AIFR (AMERICAN INSTITUTE OF FAMILY RELATIONS) PROGRAM OF EDUCATION FOR EXPECTANT PARENTS

Purpose: To determine quality of offspring, i.e., vigor, absence of defects, and postnatal health of infant; to study labor and delivery, i.e., complications, duration, subjective reactions, blood loss, medication required, etc.; and to study quality of pregnancy and recovery.

Subjects: Expectant parents and their offspring; three experimental groups and one control.

Methods: Experimental group A was given complete program; Group B was given Mothercraft and Childbirth Training only; and Group C was given all except nutrition training. Controls were paired by age, parity, education and socio-economic level.

Duration: Not reported-June 1966.

Investigator(s): Mary Jane Hungerford, Ph.D., Director, Department of Education, American Institute of Family Relations, 5287 Sunset Blvd., Los Angeles 27, Calif.

Publication: Will be submitted to appropriate journals.

19-SM-2 PROGRAMMING FOR SOCIAL RESEARCH IN MATERNAL AND CHILD HEALTH

Purpose: To follow up children with chronic illness and handicaps who have

had intensive medical and ancillary services provided by specialists, special programs, and facilities such as hospitals and rehabilitation centers and then have been returned to their home communities where primary responsibility for continuing medical and social care rests with professionals and agencies in the local community. Main objectives are: to describe experience of patients, families, and agencies during period subsequent to treatment at special facilities; to examine extent to which medical and social recommendations made at time patients were discharged from special facilities were followed; to identify those factors which promote and those which deter follow-up by patients and families of medical and social recommendations which were made; and to assess present methods of offering services to these children in relation to first three objectives.
Investigator(s): William T. Hall, Ph.D.; Daniel E. O'Keefe, Ph.D., Division of Clinical Social Work, School of Medicine, Stanford University, 300 Pasteur Dr., Palo Alto, Calif.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-SM-3 PREDICTION AND IMPROVEMENT OF POSTPARTUM ADJUSTMENT

Purpose: To replicate prediction of short-term postpartum adjustment; to investigate longer term outcome of early (first week) postpartum adjustment by taking measures at six weeks following delivery; and to determine effect of experimental intervention upon subsequent postpartum adjustment.
Subjects: Primigravid women and their husbands enrolled in a military hospital prenatal clinic and followed to six week postpartum clinic.
Methods: Experimental group would be given supportive perinatal care (group discussions, individual services, and community agency assistance). Their postpartum adjustment at six weeks and one week would be compared with that of a similar control group which received no such support. Observation and interview data obtained by home visits in first and sixth postpartum weeks would be used as part of criterion for postpartum adjustment.
Investigator(s): Virginia L. Larsen, M.D.; James Elliot, M.A.; and John B. Marks, Ph.D., Mental Health Research Institute, Post Office Box 907, Fort Steilacoom, 98332; Major Jack Pearson, AMC, and Colonel Woodrow Pickhardt, AMC, Obstetric Department, Madigan General Hospital, Tacoma, Wash.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-SM-4 SIGNIFICANCE OF VARIATIONS IN INFANT MORTALITY WITHIN MINNESOTA

Purpose: To develop a background of information which will assist in understanding problems related to infant and neonatal mortality within the State. This information will serve as basis for planning additional research studies, as well as for planning service and educational programs.
Methods: In order to measure trends in infant and neonatal mortality among the counties, cities, and regions of Minnesota, various data on births, infant deaths, and neonatal deaths for a 15-year period (1950-1964) will be analyzed. These data will be studied in an effort to account for observed differences within the State, by considering various biomedical and socioeconomic factors, such as birthweight, color or race, education, and availability of medical and hospital facilities.
Investigator(s): Abraham B. Rosenfield, M.D., M.P.H., Director, Division of Special Services and Acting Chief, Section of Maternal and Child Health; Robert W. Hiller, M.S., Chief, Section of Vital Statistics, Minnesota State Department of Health; and J. E. Bearman, Ph.D., Department of Biostatistics,

University of Minnesota, University Campus, Minneapolis, Minn. 55440. Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-SM-5 INFLUENCE OF SEASON OF CONCEPTION ON OBSTETRIC PROBLEMS AND CASUALTIES

Methods: Establish cohorts using initial date of last menstrual period as convenient estimate of when conception occurred. Seasonal pattern of conceptions can thus be determined, as well as variations in early, intermediate, and late fetal loss, infant or perinatal mortality, occurrence of complications of pregnancy, birthweight, duration of gestation, congenital malformations, etc. Consideration will also be given to differential effect, if any, of ethnic group, plurality, sex (of single-born infants), parity, and age of mother.
Investigator(s): Carl L. Erhardt, Sc.D., Director of Statistics; Jean Pakter, M.D., Chief, Maternity and Newborn Division; and Frieda G. Nelson, B.A., Senior Statistician, Bureau of Records and Statistics, New York City Department of Health, 125 Worth St., New York, N. Y. 10013.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-SM-6 DETERMINATION OF MAJOR MATERNAL COMPLICATIONS OF PREGNANCY IN ACCORDANCE WITH CERTAIN SOCIO-ECONOMIC CATEGORIES

Purpose: To determine 10 most frequently occurring maternal complications of pregnancy.
Subjects: 215,000 patients contained in 1963 computer magnetic tape file of the Perinatal Study of the Foundation for Medical Research.
Methods: Data will be analyzed to find 10 most frequently occurring maternal complications of pregnancy. These will then be subdivided into certain subcategories representing gross socio-economic groupings. Perinatal mortality for each maternal complication and socio-economic grouping will be determined and further subdivided into groups for infants of weights above and below 2500 grams. A determination of perinatal mortality rates will be made for each socio-economic category, as well as for whole group. Analysis will be made of research material to see if there are any gross differences in medical complications and if there is any relationship to patient's socio-economic status.
Investigator(s): Sydney H. Kane, M.D., Executive Director, Foundation for Medical Research, 4840 Frankford Ave., Philadelphia, Pa. 19124.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-SM-7 BARRIERS TO MATERNAL AND INFANT CARE IN NEW HAVEN

Purpose: To identify reasons why available health care facilities for pregnant women and children are not being utilized in some tracts in New Haven where infant mortality rates are high; and to learn relative contribution of each of a variety of barriers to care: social, cultural, economic, and linguistic.
Methods: A plan for improvement in health care and increased efficiency in provision of services might include utilization of nurse midwifery students or close association of prenatal, family planning, and child care facilities.

Initially, an individual trained in social science will develop a program with support of existing staff and aid of graduate students.
Investigator(s): Ira W. Gabrielson, M.D., Assistant Professor of Public Health and Pediatrics; Lowell S. Levin, Ed.D., Associate Professor of Public Health (Health Education); C. Lee Buxton, M.D., Professor of Obstetrics and Gynecology; Florence S. Wald, M.S., Dean, School of Nursing; and Paul S. Anderson, Ph.D., Associate Professor of Biostatistics; Department of Epidemiology and Public Health, School of Medicine, Yale University, New Haven, Conn. 06510.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-SM-8 DEVELOPMENT OF NEW APPROACHES TO PROGRAMMATIC ACTIVITIES IN MATERNAL AND CHILD HEALTH

Purpose: To seek new ways of developing programmatic activities in the field of maternal and child health.
Methods: Such areas as high rate of infant mortality in the Negro and Puerto Rican, errors of inborn metabolism, school health, development of a special program for high risk mothers, and drug addiction and the outcome of pregnancy will be considered.
Investigator(s): Paul M. Densen, Sc.D., Deputy Commissioner for Research and Program Planning, and Harold Jacobziner, M.D., (deceased), formerly Assistant Commissioner for Maternal and Child Health, New York City Department of Health, New York, N. Y.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-SM-9 MATERNITY CARE RESEARCH UNIT

Purpose: To describe operation of a maternity care research unit established in the outpatient department of a large, urban maternity hospital; and to describe operation of clinic, its personnel and policies, as well as those characteristics of patients which are associated with utilization of clinic services.
Methods: Analyses will be made, specifically, of social and motivational factors influencing acceptance of maternity care among a low income population. Relationship between these factors and medical care needs of women will constitute basis for formulation of specific hypotheses regarding changes required to improve maternity care. Programs will be designed and initiated to promote utilization of clinic services and to achieve more effective methods for providing care. Major emphasis will be placed on studying process of organizational change, including activities of clinic's professional and technical personnel and financial base on which services are built.
Investigator(s): Donald A. Cornely, M.D., Associate Professor of Maternal and Child Health, Graduate School of Public Health; Donald L. Hutchinson, M.D., Professor and Chairman, Department of Obstetrics and Gynecology, School of Medicine; and Jack L. Fairweather, M.D., Assistant Professor of Obstetrics and Gynecology, School of Medicine, University of Pittsburgh, Pittsburgh, Pa. 15213.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-SN-1 COMMUNITY AND PERSONAL FACTORS IN ADOPTION AND NONADOPTION OF FAMILY PLANNING SERVICES: DEVELOPMENTAL RESEARCH

Purpose: To conduct studies of factors which influence adoption and nonadoption of family planning by low income families who have been exposed to programs of information-motivation; to study forces that promote adoption and those that impede it from both a sociological and a psychological point of view--conditions in the community and psychological processes of the individual.
Methods: Populations that have been exposed to a sustained program of information-motivation will be studied, using both conventional interviewer methods and methods of clinical psychology.
Investigator(s): Donald J. Bogue, Ph.D., Professor of Sociology, University of Chicago; Paul Williams; Keshav Dev Sharma; and John Laing, Senior Research Assistants, Community and Family Study Center, 1411 E. 60th St., Chicago, Ill. 60637.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-SP-1 ACCIDENTAL POISONING IN CHILDHOOD - A PSYCHOSOCIAL STUDY

Purpose: To establish true prevalence of accidental poisoning in preschool children; to discover and account for any differences in characteristics of reporting and nonreporting families, families of single ingestures or poison repeaters, and matched controls; and to examine current preventive measures in light of this information.
Subjects: A random sample of 1,500 families derived from an initial universe of 4,000 in a rural, New England community.
Methods: Each family of a preschool child will be investigated through a home visit, standardized interview, poisoning-health-accident questionnaire, poison hazard survey, and child's poison recognition and discrimination test. A second home visit will be made 18 months after initial home study and a repeat of these methods will be carried out. Data will be analyzed according to standard, statistical methods.
Duration: June 1965-May 1969.
Investigator(s): Raymond Sobel, M.D., Professor of Psychiatry, Dartmouth Medical School, Hanover, N. H.
Cooperating group(s): Division of Accident Prevention and Research, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: *Pediatrics* 35:641-651, 1965.

19-SP-2 A PEDIATRIC CARDIAC PROGRAM SERVING THE STATE OF CONNECTICUT

Purpose: Organization and service to Connecticut children who have cardiac disabilities.
Subjects: Children from birth to age 21 with cardiac problems.
Methods: A demonstration pediatric cardiac program which ran from 1947 to 1960 and subsequently was taken over by Yale Medical Center, served all patients with murmurs referred from entire State, without professional charge. Team included medical social worker, public health nurse, pediatricians, and pediatric cardiologists. Reports were sent to all referring physicians and agencies. Cardiac catheterization and surgery were available for those who required it. Data on each patient have been coded and analyzed. Certain family and nursing studies have been done.
Findings: Five-thousand patients were seen; 39 percent had innocent murmurs, 13 percent had rheumatic fever or rheumatic heart disease, and

44 percent had congenital heart disease.
Duration: 1947-1966.
Investigator(s): Ruth Whittemore, M.D., Associate Clinical Professor of Pediatrics, School of Medicine, Yale University, and Senior Physician, Connecticut State Department of Health, 333 Cedar St., New Haven, Conn.
Cooperating group(s): Connecticut Heart Association; Yale University School of Medicine; New Haven Department of Health; Connecticut State Department of Health; Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.
Publication: A monograph is in the process. Certain individual papers will appear in medical literature.

19-SP-3 CHILDHOOD ACCIDENT STUDY

Purpose: Study of child, family, and environmental circumstances of accident injury in preschool children suffering accidents requiring hospitalization is planned to include selected information on injury severity, family life at time of accident, child characteristics, and family health and safety subsystems of belief and practices.
Subjects: All children resident in Chittenden County, Vermont who are admitted during a 12-month period to one of the hospital services for an accidental injury occurring during that period, and a probability sample of children in the same county area.
Methods: Hospital observation, home visiting, and structured interviews.
Duration: August 1963-1966.
Investigator(s): John H. Mabry, Ph.D., Associate Professor, and Roger J. Meyer, M.D., Assistant Professor of Epidemiology and Community Medicine, College of Medicine, University of Vermont, Burlington, Vt.

19-SP-1 EVALUATION OF THE RESOURCES OF A PEDIATRIC OUTPATIENT PROGRAM

Purpose: To explore in depth social problems and consequent needs of patients presenting themselves for treatment in the pediatric outpatient department; and thereafter to study better methods of providing quality medical care and optimal utilization of other community resources to meet steadily increasing demand for outpatient services. This includes utilization of para-medical personnel and physicians at various levels of training.
Subjects: A large random sample of patients presenting themselves for care in the Pediatric Outpatient Department of the Los Angeles County General Hospital, approximately 2,500 to 3,000 patients per month, for a period of two months.
Methods: College and medical students interview a random sample of patients presenting themselves for care over a 24-hour period daily. Questions include following: age, sex, ethnic background, geographical residence, place of birth, marital status of family, initial reference, mode of transportation to clinic, availability of regular family doctor, or other source of medical advice; utilization of public health clinics, financial status of family, reason for coming at a specific hour, availability of telephone, type and severity of illness as viewed by parent and examining doctor, services utilized in the Los Angeles County General Hospital outpatient department, and disposition of patient. Data will be analyzed by machine tabulation.
Duration: June 1965-unknown.
Investigator(s): Willis A. Wingert, M.D., Assistant Professor of Pediatrics, University of Southern California, and Director, Pediatric

Outpatient Department; and David B. Friedman, M.D., Assistant Director, Pediatric Outpatient Department, Los Angeles County General Hospital, Los Angeles, Calif.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-SP-5 EXPLORATION OF PARENTAL UTILIZATION OF NURSING SERVICES FOR CHILDREN

Purpose: To discern socio-psychological and environmental factors affecting parents and health service personnel as they are associated with differential patterns of health service and health service utilization.
Subjects: Parents whose two-year old children are currently registered in child health stations and those whose registrations have been terminated.
Methods: Development of various instruments: record review abstracts; home and station interview schedules for parents; observation guides; and questionnaires for health personnel, which are used to describe the following: health service utilization behavior of parents over a period of time; manner in which parents define health and illness and activities associated with these definitions; climate of opinion about parental behavior among health service personnel; and social behavior of parents and health personnel in selected child health stations.
Duration: July 1964-August 1966.
Investigator(s): Helen M. Simon, R.N., M.A., Director, Nursing Research, Bureau of Public Health Nursing, New York City Department of Health, 40 Worth St., New York, N. Y. 10013.
Cooperating group(s): National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-SP-6 STUDY OF OUTPATIENTS AT MONTREAL CHILDREN'S HOSPITAL

Purpose: To provide Montreal Children's Hospital with information relevant to planning necessary anticipated expansion in the outpatient department; and to discover why parents use outpatient services for their sick children and why they select this particular outpatient department.
Methods: Collection of following information about families using the outpatient department: socio-economic characteristics; judgments of illnesses requiring treatment; channels and pathways leading them to this particular clinic; other medical services they use; their location in the metropolitan area; and their feelings regarding their experiences in clinic.
Duration: June 1963-April 1967.
Investigator(s): Alan Ross, M.D., C.M., F.R.C.P. (Canada), Physician-in-Chief, Montreal Children's Hospital, 2300 Tupper St., Montreal 25, Que.
Cooperating group(s): Department of Sociology and Anthropology, McGill University; Department of National Health and Welfare of Canada.

19-SP-7 A STUDY OF METHODS FOR PEDIATRIC EDUCATION RELEVANT TO COMMUNITY NEEDS AND AGENCY CHILD HEALTH PROGRAMS

Purpose: To define health needs in a community adjacent to a teaching hospital; to determine how these needs are modified by economic, medical, cultural, educational, and ethnic determinants; and to explore how these needs are met by local pediatric care and welfare and/or health agency programs.

Methods: After problem is defined, study will consist of orientation of medical students, house officers-in-training, and pediatricians toward an active role in child-centered community health programs, and improvement of interdisciplinary cooperation between a department of pediatrics in a medical school-teaching hospital and practicing pediatricians, educational, welfare, social work, and health agencies.
Investigator(s): Jack Metcoff, M.D., Professor and Chairman, Department of Pediatrics, Chicago Medical School, and Chairman, Division of Pediatrics, Michael Reese Hospital and Medical Center, 29th and Ellis Ave., Chicago, Ill. 60616.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

19-SS-1 FURTHER ANALYSIS OF FOLLOW-UP STUDY DATA

Purpose: To determine which, if any, antecedent clinical variables predict status of clinic patients one to 10 years after the end of the clinic contact. Original data were collected by Dr. Eugene Levitt in 1956.
Subjects: 469 former child guidance clinic patients ranging in age from 11 to 29 years with a mean age of 15.87 years at time of follow-up. Mean follow-up interval was 5.39 years.
Methods: A symptom change score between intake and follow-up interview is being computed for each case. Then mean change scores will be compared for subgroups formed on basis of various antecedent clinical variables such as quality of mother-child relationship at time of initial clinic contact, child's diagnosis, etc.
Duration: February 1962-not reported.
Investigator(s): Elise E. Lessing, Ph.D., Assistant Director of Research, and Kenneth I. Howard, Ph.D., Chief, Division of Measurement and Evaluation, Institute for Juvenile Research, 907 S. Wolcott St., Chicago 12, Ill. (Reported by Noel Jenkin, Ph.D., Director of Research, Institute for Juvenile Research.)

19-SS-2 DROP-IN GROUP GUIDANCE

Purpose: To evaluate possibility of immediately-available group counseling and guidance being used as both preventive and short-term therapeutic intervention.
Subjects: All patients applying to San Fernando Valley Child Guidance Clinic and satellite offices.
Methods: Brief individual and group screening and immediate group counseling (where indicated) for all subjects and their parents. Prompt referral for more definitive services or to other agencies is also offered.
Duration: February 1965-January 1970.
Investigator(s): I. Hyman Weiland, M.D., Director, San Fernando Valley Child Guidance Clinic, 14852 Ventura Blvd., Sherman Oaks, Calif.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Initial report submitted for presentation at 1966 meeting of American Orthopsychiatric Association.

19-SS-3 CRISIS INTERVENTION IN PRE- AND EARLY SCHOOL YEARS

Purpose: To identify variables within child, home, school, and community related to child's ability to successfully adapt to and cope with stress of school entry and early school years; and to explore various methods of intervention by mental health personnel designed to help child, home, school, and community to decrease stress and increase adaptive skills.
Methods: Four teams of psychiatrists, pediatricians, psychologists, and psychiatric social workers will do intensive preschool screening on a selected group of entering first graders, make prognostic judgments concerning their ability to adapt to school situation, and offer brief counseling to parents to help children meet this crisis. A full-time school psychologist will consult with teachers concerning these children and follow their adjustment during the first four grades.
Duration: January 1963-January 1968.
Investigator(s): Carl A. Bramlette, Jr., Ph.D., Coordinator, Mental Health Education; Merle Robert Newton, Community Psychologist, Sumter County Mental Health Project; Charles D. Whatley, Jr., Ph.D., Research Consultant; Elsye McKeown, Mental Health Consultant in Psychiatric Social Work, South Carolina Mental Health Commission, 2214 Bull St., Columbia; and R. Ramsey Mellette, Jr., M.D., Director, Charleston County Mental Health Clinic, 275 Calhoun St., Charleston, S. C. (Reported by Racine D. Brown, South Carolina State Department of Mental Health.)
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-SS-4 PROBLEM PREVENTION IN THE PRIMARY GRADES

Purpose: To evaluate effects of coordinated psychiatric approaches in working with very young children in kindergarten, and first and second grades of selected public schools in New York City; to determine most effective ways of providing these children with the particular type of help they need at this stage of their development; and to determine whether such help provided at this time will prevent development of more serious problems and more severe difficulties at later stages in their lives.
Methods: Core of program includes attempts at group therapy with children, discussion groups with their parents, and seminars and workshops with their teachers. A special aspect involves selection of those children who also have younger siblings who have not yet entered school. It will therefore be possible to attempt to evaluate effects of this program on future adjustment of preschool siblings when they enter school as well as to follow up their older siblings in higher grades. Attempts will be made to evaluate various techniques for reaching and providing effective casework, psychiatric, and psychological help for these children and particularly their parents. There will also be a longitudinal follow-up of at least five years of those children who receive therapy (experimental group), an equivalent group of children with similar behavior problems who did not receive therapy (control group), and a group of children who were not referred by their teachers as showing any behavior problems in primary grades.
Duration: Not reported-December 1966.
Investigator(s): Kenneth B. Clark, Ph.D., and Paul K. Benedict, M.D., Ph.D., Northside Center for Child Development, Inc., 31 W. 110th St., New York 26, N. Y.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-SS-5 CONSULTATION FOR PSYCHOLOGICAL PROBLEMS IN CHILDREN

Purpose: To explore systematically some specific ways in which problems in current interpersonal communication contribute to behavior disorders in this population; to develop and test effectiveness and economy of intervention methods designed to help resolve communication difficulties through changes in child's physical and interpersonal environment at home and at school, without direct intervention into either child's or relevant adult's intrapsychic problems; and to examine whether this approach provides a basis for specialized mental health consultation to schools, which can serve as part of a community mental health program.

Subjects: Grade school children with both chronic learning difficulties and more general behavior problems.

Methods: Findings will be evaluated through systematic following of all cases over a period of two years with uniform measures, and by comparing demonstration group results with those of several control groups.

Investigator(s): J. W. Kaswan, Ph.D.; L. R. Love, Ph.D.; and E. H. Rodnick, Ph.D., Department of Psychology, University of California at Los Angeles, Los Angeles 24, Calif.

Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-SS-6 PILOT PROJECT ON HOME MANAGEMENT OF FAMILY CRISES

Purpose: To analyze in detail the family as a social system, and to ascertain ways of altering significant facets of family functioning.

Subjects: Total families present having a child with distrubed behavior.

Methods: Visiting in home by a highly trained psychiatric nurse, averaging 50 hours of observation.

Duration: April 1963-June 1965.

Investigator(s): Frank T. Rafferty, M.D., Associate Professor in Psychiatry, and Director of Child Psychiatry; Sally Miller McClure, M.A., and Blanche Ingraham, M.A., Research Assistants, Medical School, University of Maryland, 645 W. Redwood St., Baltimore, Md. 21201.

Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

Publication: Manuscript presented at American Orthopsychiatric Association meeting.

19-SS-7 EARLY DETECTION AND PREVENTION OF EMOTIONAL PROBLEMS

Purpose: To develop and test new approaches and procedures for a community mental health program; more specifically, to develop community field programs in school setting oriented toward prevention of emotional disturbance in young (primary grade) children; to develop assessment procedures to detect pathology or incipient pathology at earliest possible time and to explore techniques of immediate secondary prevention with such cases; to develop and modify subprofessional and professional training programs as a means of increasing number of both supervisory and field workers; and to conduct continuing research evaluating effectiveness of prevention program, of many of its separate subcomponents, of subprofessional training programs and people whom they attract, and of changes introduced in professional level training programs.

Duration: September 1964-September 1969.

Investigator(s): Emory L. Cowen, Ph.D., Professor of Psychology; Melvin Zax, Ph.D., Associate Professor of Psychology, University of Rochester;

Louis D. Izzo, Psychologist; and Mary Ann Trost, Social Worker, Rochester City School District, Rochester, N. Y.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

19-SS-8 MOTHERS AS COLLEAGUES IN SCHOOL MENTAL HEALTH WORK

Purpose: To develop and evaluate effectiveness of a program of primary prevention of emotional illnesses in school children; and to learn more about salient dimensions of mental health in young children.
Subjects: Approximately 200 children entering kindergarten in 1965 and 1966, in three elementary schools of a St. Louis County school district.
Methods: Use of Campbell and Stanley's Recurrent Institutional Cycle Design to evaluate effects of preventive program in experimental classrooms, by comparing change measures of children in those rooms with similar measures of children in control classrooms. Two mental health professionals observe and rate children three times a year in each school. In experimental classrooms, a mental health professional conducts research interviews with volunteering mothers, offers casework service at their request, and gives ongoing consultation to teachers and principal.
Findings: In a trial run of preventive program in 1964-65, 76 percent of invited mothers volunteered for research interviews, and 36 percent of those subsequently requested additional casework help. Except in one case, additional help was sought for an older child in family, rather than for subject of research interview. Thus, mothers act as casefinders.
Duration: September 1965-August 1969.
Investigator(s): Lorene A. Stringer, M.S.W., Community Mental Health Coordinator, and John C. Glidewell, Ph.D., Director, Division of Research and Development, St. Louis County Health Department, 801 S. Brentwood Blvd., Clayton, Mo. 63105.
Cooperating group(s): School District of Ladue, St. Louis County; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Yearly progress reports available from St. Louis County Health Department. Limited supply of project proposal, as submitted to National Institute of Mental Health, is available now.

19-SS-9 A FOLLOW-UP SURVEY OF THE EFFECTIVENESS OF A PROVINCIAL CHILD GUIDANCE CLINIC IN RURAL COMMUNITIES

Purpose: To assess various kinds of services that can be offered by guidance clinics to rural children, kinds of children that are referred to these clinics, community attitudes towards them, and follow-up information on their effect.
Subjects: 780 children seen for diagnostic consultation by Edmonton Guidance Clinic. This includes 150 city children who served as matched controls.
Methods: Three kinds of rural diagnostic services are being evaluated by follow-up techniques: rural children who are brought to the city; rural children who are seen in regularly scheduled travelling clinics to large rural centers; and children who are seen in their own community where clinic team comes to their community on an unscheduled basis as required.
Findings: Tentative results suggest important differences in effectiveness of consultations for city children and rural children, but these differences are not particularly a function of the kind of rural area serviced nor the extent of intensity of service provided by the clinic to that area.

Duration: April 1964-September 1965.
Investigator(s): A. Ralph Schrag, M.D., Child Guidance Clinic, Provincial Department of Public Health, Edmonton; and P. O. Davidson, Ph.D., Assistant Professor of Psychology, University of Alberta, Calgary, Alta.
Cooperating group(s): Department of National Health and Welfare of Canada.
Publication: Publications submitted to Journal of Child Psychology and Psychiatry and American Journal of Orthopsychiatry. Major results planned for publication in Canada's Mental Health.

RESEARCH NOTES

CURRENT EMPHASES IN DELINQUENCY GRANTS PROGRAM

With the establishment of the Office of Economic Opportunity in 1964, the focus of the grants program of the Office of Juvenile Delinquency and Youth Development (Welfare Administration, U. S. Department of Health, Education, and Welfare) has shifted from comprehensive demonstration projects dealing with the community setting to short-term projects involving selected groups of delinquent and potentially delinquent youth in settings other than deprived inner-city areas. Current projects emphasize group work and special education techniques with potential delinquents and dropouts, therapeutic measures for glue-sniffers and drug users, use of volunteers in action programs, training of neighborhood men to provide an identification model for fatherless boys, half-way houses, job opportunities, the rewarding of socially acceptable behavior by inmates of a training school, and rehabilitation methods utilizing alternatives to institutionalization.

NEW ABSTRACTING SERVICE FOR POVERTY INFORMATION

The Research Division of the Institute of Labor and Industrial Relations (University of Michigan and Wayne State University) has begun publication of Poverty and Human Resources Abstracts, a bimonthly reference work which includes detailed abstracts, shorter annotations, bibliographic references, a review article, and a section on national and state legislative developments in this rapidly growing field of study. Information sources include over 300 U. S. and Canadian journals, publications of governmental and private agencies, and relevant information referred by a National Information Referral Committee. Information is available from the Institute, P.O. Box 1567, The University of Michigan, Ann Arbor, Michigan 48106.

NEW DEVELOPMENTS IN GRANTS PROGRAM OF CHILDREN'S BUREAU

Under a grant from the Children's Bureau, a Clinical Research and Training Center in Child Welfare has been established at the School of Social Service Administration, University of Chicago. Plans are to incorporate a research orientation and current research findings into the early professional training of child welfare workers. Thus, objective evidence will be obtained on successful or unsuccessful methods. In addition, students will benefit from direct exposure to the problems of the client. Although this program is now in its early stages, the Children's Bureau hopes that additional centers can later be established at appropriate universities.

Another proposal, still in the planning stages, would make funds available for individual dissertation studies in child welfare. The grants would be made through universities and would encourage the undertaking of studies, limited in scope, which would reflect the ideas of a new generation of professionals. The requirements and procedures for this program are currently being developed.

REVISED MENTAL RETARDATION AND ABUSED CHILD LISTINGS

Research Relating to Mentally Retarded Children, first published by the Children's Bureau Clearinghouse in 1960, is now available in revised form. It includes 858 studies reported to the Clearinghouse through 1965, and may be purchased from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402. The price is 65 cents. Free copies of the "Bibliography on the Battered Child" are also available in revised form from the Clearinghouse, Children's Bureau, Washington, D. C. 20201.

OTHER ABSTRACTING JOURNALS AND SERVICES

Child Development Abstracts and Bibliography, Child Development Publications, Society for Research in Child Development, Inc., Purdue University, Lafayette, Ind.
Digest of Neurology and Psychiatry, Institute of Living, Hartford, Conn.
Dissertation Abstracts, University Microfilms, Ann Arbor, Mich. (Gives synopses of U. S. doctoral dissertations with an annual index.)
dsh Abstracts, Deafness, Speech and Hearing Publications, Gallaudet College, Washington 2, D. C.
Excerpta Criminologica, New York Academy of Medicine Bldg., 2 E. 103rd St., New York 29, N. Y.
Inventory of Social and Economic Research in Health, Health Information Foundation, 420 Lexington Ave., New York 17, N. Y.
Listing of Health and Welfare Research Projects in Local Communities, United Community Funds and Councils of America, Inc., 345 E. 46th St., New York 17, N. Y.
Nursing Research, American Journal of Nursing Co., 10 Columbus Circle, New York, N. Y.
Nutrition Abstracts and Reviews, Rowett Research Institute, Bucksburn, Aberdeenshire, Scotland.
Psychological Abstracts, American Psychological Association, 1333 - 16th St., N. W., Washington 6, D. C.
Rehabilitation Literature, National Society for Crippled Children and Adults, 2023 W. Ogden Ave., Chicago 12, Ill.
Research and Study Projects Reported by FSAA Member Agencies, Family Service Association of America, 215 Park Ave. South, New York 3, N. Y.
Sociological Abstracts, Leo P. Chall, 225 W. 86th St., New York 24, N. Y.

The Excerpta Medica Foundation, New York Academy of Medicine Bldg., 2 E. 103rd St., New York 29, N. Y., has established an abstracting service on pediatrics on a yearly subscription basis. In addition to abstracts, Excerpta Medica can provide to subscribers, at cost, photocopies and translations of complete articles.

The Human Relations Area Files have classified cultural data on primitive and non-primitive societies into 710 categories of human behavior. Complete sets of all files are available in 22 member institutions in the United States. For information, write to Dr. Clellan S. Ford, President, Human Relations Area Files, Yale University, New Haven, Conn. 06520.

The Science Information Exchange, Smithsonian Institution, 209 Madison National Bank Bldg., 1730 M St., N. W., Washington, D. C. 20036, provides to qualified investigators on request selected abstracts of current research supported by foundation or government grants. The Exchange covers such fields as medicine, nursing, public health, nutrition, psychology, education, anthropology, mental health, and intercultural relations.

The World Federation for Mental Health, 19 Manchester St., London W.1, England, operates a clearinghouse for research and study projects in the field of mental health.

In addition to these journals and services, many professional journals in such fields as pediatrics and mental deficiency include a section of abstracts regularly or once a year. There are also a number of indexes and abstracting journals in the medical area which occasionally refer to materials in the area of child development.

CHILDREN'S BUREAU
CLEARINGHOUSE FOR RESEARCH IN CHILD LIFE
WASHINGTON, D. C. 20201

If you or your colleagues are currently engaged in research on children or their families, we would greatly appreciate your cooperation in providing a short summary of your work for inclusion in the next issue of *Research Relating to Children.*

The Clearinghouse is the branch of the Children's Bureau which collects and disseminates information on current research relating to children and their families. Its purpose is to provide research investigators with information about other research in progress, to point up gaps in present research, and thereby to stimulate more effective research.

The instructions on the third page of this form will serve as a guide for your summary. You will, of course, receive a free copy of the issue in which your study appears.

If you know of others doing research which might be of interest to the Clearinghouse, please give name(s) and address(es) below:

____

____

Thank you for your cooperation.

SUMMARY OF RESEARCH PROJECT

Title:

Purpose:

Subjects (sample):

Methods:

Findings to date, if any:

Date project initiated: Estimated terminal date:

Principal investigator(s) only Degree Position and organization

Cooperating groups (in the research or in the funding of the research):

Publication references and/or plans (If no publication is planned, please indicate under what conditions data and results will be available):

If this represents work toward an academic degree, please state degree ________________________.
(Please do not report master's theses unless they represent work beyond a doctorate, as in dentistry.)

INSTRUCTIONS

Please report studies in progress (or recently completed) which:

center on children or their families in such areas as child growth and development, intelligence, personality, education, social adjustment, family life, physical and emotional disorders, etc.

concern service programs in the fields of child health, child welfare, or special education

Please *DO NOT* report:

studies already reported to the Clearinghouse

purely medical studies limited to morphology or physiology, the physical aspects of etiology, epidemiology or symptomatology of diseases or handicapping conditions, surgery, chemotherapy, antibiotics or physical therapy; biochemical or other laboratory studies; animal studies

educational studies of curriculum construction or materials, teaching methods, surveys of school facilities or needs, general school administration studies

studies already published in sources generally available in major libraries across the country

demonstration projects, unless there is a formal plan for evaluation

studies of test development, standardization, or validation, except for special groups of children such as blind or retarded

regularly collected material such as annual reports, work preparatory to writing handbooks; directories; research based on secondary sources

master's theses, unless they represent work beyond a doctorate, as in dentistry

THE CHILDREN'S BUREAU
AND ITS
CLEARINGHOUSE FOR RESEARCH IN CHILD LIFE . . . .

The Children's Bureau was established in 1912 to "investigate and report. . . . upon all matters pertaining to the welfare of children and child life among all classes of our people." From this beginning, the Bureau has extended its activities into such areas as developing standards of care for children and providing funds to States to improve conditions for children. More recently, the Bureau has established several new grants programs to support research in areas of maternal and child health and child welfare.

In keeping with the basic act establishing the Bureau, the Clearinghouse for Research in Child Life was set up in 1948. Its function is to collect information about current research with children in order to keep investigators informed of the work of other investigators, to point up gaps in present research, and hopefully to stimulate more effective research programs.

Investigators reporting a study to the Clearinghouse receive a free copy of the issue of *Research Relating to Children* in which their study appears. Additional free copies of each issue are sent to directors of research programs and to libraries. Individuals may purchase copies from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. The Clearinghouse maintains a mailing list of persons to be notified whenever a new issue is published, usually twice a year.

The Children's Bureau Clearinghouse routinely exchanges information with other clearinghouses in related fields such as the National Research and Information Center on Crime and Delinquency of the National Council on Crime and Delinquency, and the U.S. Public Health Service Clearinghouse on Current Morbidity Statistics Projects. The Science Information Exchange is very helpful in providing abstracts of research supported by federal funds and by large foundations.

The major source of information, however, is the individual research investigator, whose help is essential in obtaining the most complete and up-to-date coverage possible.

U.S. DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE

Previous Issues of

RESEARCH RELATING TO CHILDREN

Single copies of the following issues are available without charge from the Clearinghouse, Children's Bureau, Washington, D. C. 20201:

Bulletin II, Supplement 2 (November 1952-May 1954)
Bulletin II, Supplement 3 (April 1954-January 1955)
Bulletin II, Supplement 4 (February-November 1955)

Copies of the following issues are available from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402:

Bulletin 4 (May-September 1956) - 75 cents
Bulletin 9 (August 1958-February 1959) -$1.00
Bulletin 17 (February 1963-February 1964) - 75 cents
Bulletin 18 (March-December 1964) - $1.25

The following issues are OUT OF PRINT

Bulletin I (December 1948-June 1949)
Bulletin I, Supplement 1 (July 1949-March 1950)
Bulletin I, Supplement 2 (April-July 1950)
Bulletin I, Supplement 3 (August-December 1950)
Bulletin I, Supplement 4 (January-April 1951)
Bulletin I, Supplement 5 (May-December 1951)

Bulletin II (January-October 1952)
Bulletin II, Supplement 1 (January 1952-March 1954)

Bulletin 3 (December 1955-April 1956)
Bulletin 5 (October 1956-February 1957)
Bulletin 6 (March-July 1957)
Bulletin 7 (August 1957-February 1958)
Bulletin 8 (March-July 1958)
Bulletin 10 (March-July 1959)
Bulletin 11 (August 1959-February 1960)
Bulletin 12 (February-July 1960)
Bulletin 13 (August 1960-January 1961)
Bulletin 14 (February-September 1961)
Bulletin 15 (October 1961-June 1962)
Bulletin 16 (July 1962-January 1963)

An investigator receives a free copy of the issue of Research Relating to Children in which his study appears. Additional free copies are available to directors of research centers and to libraries upon direct request to the Clearinghouse, Children's Bureau, Washington, D. C. 20201.

The Clearinghouse will be happy to add anyone to the mailing list to be notified whenever a new issue is published.

FOREWORD

This Bulletin, like previous issues, includes reports of research in progress or recently completed. With the exception of the long term research, it does not report again studies included in Bulletins 3 through 19 even though they may still be continuing. This issue, therefore, does not reflect all research relating to children in a given period but only that which was first reported to the Clearinghouse October 1, 1965 through May 1966.

The Clearinghouse has only such information about the studies as the abstracts provide. Publication references and plans are given by some of the investigators but the Clearinghouse does not maintain bibliographic information on published reports of the studies. The reader who wishes to obtain further details about any of the projects reported should check professional journals in the appropriate field or write directly to the investigator.

For the Clearinghouse, I wish to thank those who have submitted reports on their own projects and those who have told us of other studies, and to acknowledge the valuable assistance of the Science Information Exchange, and the foundations which provide us with information about their research grants.

786

LONG TERM RESEARCH

Note: The reports in this section concern research programs which are more or less continuous.

20-AA-1 GROWTH, DEVELOPMENT, AND ADAPTATION OF HUMAN INDIVIDUALS

Purpose: To gain greater understanding of many factors involved, prenatal and postnatal, as an individual is in the process of becoming the kind of a person he is as an adult.
Subjects: Approximately 100 middle class families in Denver, Colorado, including 210 offspring of whom over 50 are second generation followed in the institute. (80 percent of subjects entered since 1930 are still being followed.)
Methods: Each subject followed from birth at regular intervals studying: (1) pattern of changing structure by direct measurements, X-rays, and photographs; (2) development of personality traits, starting with family during prenatal period and carried on intensively with infant, child, and adult; (3) patterns of physiological development including nutrition, biochemical and physiological tests, and evaluation of healthiness.
Duration: 1927-continuing.
Investigator(s): Robert W. McCammon, M.D., Director, Child Research Council, University of Colorado, 4200 E. Ninth Ave., Denver 20, Colo.
Cooperating group(s): University of Colorado; Commonwealth Fund; McDonald Foundation; Nutrition Foundation; National Live Stock and Meat Board; Gerber Company; Lawrence Phipps Foundation; National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Appropriate medical or scientific journals every year. Publication lists available.

20-AA-2 ANALYSIS AND EVALUATION OF DATA FROM THE LONGITUDINAL STUDY OF CHILD HEALTH AND DEVELOPMENT BASED UPON MULTIDISCIPLINE AND PERIODIC OBSERVATIONS OF INDIVIDUAL CHILDREN FROM BIRTH TO 18 YEARS

Initiation date: 1930.
Investigator(s): Research has been discontinued but the analyses of data and preparation of reports are being continued by individuals under the direction of Robert B. Reed, Ph.D., Professor of Biostatistics, Harvard School of Public Health, 55 Shattuck St., Boston 15, Mass.

20-AA-3 LONGITUDINAL STUDY OF CHILD GROWTH AND DEVELOPMENT

Purpose: Program consists of study of adult personality, adjustment and aging processes of individuals whose health, growth, personality development, and environment have been studied since birth. It included a study of the aging processes of their parents in relation to physical and biochemical measures made earlier. It will include studies of: parental child-rearing attitudes and practices of two generations in the same families; constancy of autonomic response patterns to stress from childhood to young adulthood and their relationship to psychosomatic disorders in adulthood; blood lipids in relationship to body composition and change in composition.
Investigator(s): Lester W. Sontag, M.D., Director, Fels Research Institute for the Study of Human Development, Antioch College, Yellow Springs, Ohio.
Cooperating group(s): Public Health Service, U. S. Department of Health, Education, and Welfare.

20-AA-4 LONGITUDINAL CROSS-CULTURAL STUDY OF HUMAN DEVELOPMENT

Purpose: To observe the long term effects of environment upon growth and health, that is, the influence of environmental factors upon physical and mental development, and the elucidation of their mode of action and interaction with genetic endowment.
Subjects: Several hundred males followed from prepuberty, all with four grandparents from the same limited geographical zone of southern Italy but now living in the markedly different cultures of Boston, Rome, and Palermo; other groups of 100 girls and several hundred boys in Florence, Italy and 200 girls in Boston.
Methods: Repeated medical, anthropometric and psychological examinations together with family interviews (with evaluation of child-rearing practices), nutrition, and socio-cultural data.
Findings: Reported in numerous articles in American and European journals. Current work under analysis includes cross-cultural study of moral values, studies of biological age and its estimation, estimation of socio-economic status across cultures, blood groups and temperament, and changing hemoglobin values in adolescent males. Work involving further and continuing data collection includes prediction of growth variables, cross-cultural study of creativity and its environmental determinants, a study of left handed subjects in the relatively "permissive" and "intolerant" cultures of the United States and Italy, and an analysis of menstrual symptoms in both cultures.
Duration: 1956-1968.
Investigator(s): Harben Boutourline Young, M.D., Assistant Professor of Physiology, Harvard School of Public Health, Boston 15, Mass.
Cooperating group(s): Grant Foundation; Wenner Gren Foundation; Olivetti Corporation; Universities of Florence, Rome, and Palermo.

Publication: Numerous journal articles; one book is planned, another possible.

20-AA-5 BIOLOGIC AND ENVIRONMENTAL FACTORS IN CHILD DEVELOPMENT

Purpose: To investigate the relationship of biologic, genetic, and environmental factors in the parents--including events during pregnancy, labor, and delivery--to normal and abnormal development of offspring. Expected byproducts of investigation are relationships of these factors to pregnancy wastage in the form of early fetal death, perinatal mortality, infant and childhood mortality, and estimates of incidence of different types of abnormalities. In addition, detailed growth curves for children from birth to six years of age will be derived on a longitudinal basis, and estimates of illnesses and injuries in infancy and the preschool child will be derived.
Subjects: Members of the Kaiser Foundation Health Plan--a prepaid medical care program--who reside in the San Francisco-East Bay area.
Methods: Study is of a prospective, longitudinal type for both mother and child. Observations are made on the gravidas in the Department of Obstetrics and Gynecology, and on the children in the Pediatric Department, and are supplemented by special interviews and laboratory examinations. Physicians' observations are systematized and made more uniform. Special efforts are made to obtain information on members of study who do not return to the plan for medical care.
Duration: July 1959-indefinite.
Investigator(s): Jacob Yerushalmy, Ph.D., Professor of Biostatistics, University of California, Berkeley; Alexander L. King, M.D., Director of Pediatrics; and Robert W. King, M.D., Consultant, Department of Obstetrics and Gynecology, Kaiser Foundation Hospital, Oakland, Calif. (Reported by C. H. Peckham, M.D., 3783 Piedmont Ave., Oakland, Calif. 94611.)
Cooperating group(s): Division of Biostatistics, School of Public Health, University of California; Permanente Medical Group; Kaiser Foundation Research Institute.
Publication: Yerushalmy, J., "Statistical Considerations and Evaluations of Epidemiological Evidence," in Tobacco and Health, Chas. C. Thomas, publisher, 1962. American Journal of Obstetrics and Gynecology 87:5:609-620, November 1, 1963; 88:4:505-518, February 15, 1964. Vox Sanguinis 8:376-377, May-June 1963; 8:549-556, September-October 1963; 9:502-504, 1964. Human Biology 36:2:86-103, May 1964. Obstetrics and Gynecology 24:5:707-715, November 1964. American Journal of Diseases of Children 109:43-57, January 1965.

20-AA-6 THE BERKELEY (CALIFORNIA) GROWTH STUDY

Purpose: A study of the mental and physical growth of approximately 50 normally healthy persons from birth in 1928-29 to the present (35 years).
Subjects: Full term, healthy newborns, born in Berkeley, California hospitals of white, English-speaking parents, if parents were interested--a somewhat selected above average group. 100 offspring of these subjects, age range from a few months to about 16 years, seen irregularly, but the same data (appropriate for age) are collected that were collected for their parents.
Methods: Tests of mental and motor development; pediatric examination; interviews at frequent intervals during growth beginning in first week of life. At all visits, inquiries made concerning current health and recent illnesses. Anthropometrics, body photographs, and skeletal X-rays taken at

most ages. Socio-economic data available. Comparisons now being made on variety of collected data. Studies of physical aspects of children's growth include analyses comparing health histories with physical growth and with skeletal maturation. Some parent-child relations in susceptibility to illness could be studied. Emotional and other personality variables studied for consistency, and in various interrelations with maternal behavior in infancy, birth histories, socio-economic status, intellectual and physical growth.
Duration: 1928-continuing.
Investigator(s): Nancy Bayley, Ph.D., and Dorothy H. Eichorn, Ph.D., Associate Research Psychologist, Institute of Human Development, University of California, Berkeley 4, Calif.
Cooperating group(s): Institute of Human Development, University of California.
Publication: Studies in the Development of Young Children, University of California Press, 1940. Growth Diagnosis, University of Chicago Press, 1959. Child Development 12:167-173, 1941; 27:45-74, 1956. American Psychologist 10:805-818, 1955. Monograph, Society for Research in Child Development 28, 1963.

20-AA-7 MEDFORD, OREGON BOYS' GROWTH STUDY

Purpose: To construct cross-sectional, convergence, and longitudinal growth and acceleration curves for maturity indices, structural measures, strength tests and batteries, and motor ability elements; to relate various physical and motor growth factors to skeletal age, somatotype components, nutritional status, socio-personal adjustment, interests, and scholastic aptitude and achievement.
Subjects: Boys, seven to 18 years of age.
Methods: (1) Cross-sectional analyses for boys from 9 through 15 years of age; (2) convergence analyses, based on four-year sequences with each fourth year overlapping, for ages seven through 18 years; (3) longitudinal analyses from seven to 18 years; (4) intercorrelational and factor analyses of all traits for the different ages; (5) trace the development of all traits for boys who become athletes, honor roll students, school and other organization leaders, delinquents, and the like.
Duration: September 1956-May 1968.
Investigator(s): H. Harrison Clarke, Ed.D., Research Professor, School of Health, Physical Education and Recreation, University of Oregon, Eugene, Oreg.
Cooperating group(s): Athletic Institute (Chicago, Ill.); Medford Public Schools; Curriculum Development Fund, Oregon State Department of Education; and Office of Scientific and Scholarly Affairs, University of Oregon.
Publication: Mimeographed report: "Initial Contributions and Implications of the Medford Boys' Growth Study, 1956 to 1965;" monographs; articles in professional journals.

20-AA-8 PATTERNS OF SOOTHING AND EXCITATION IN NEONATES

Purpose: To investigate the role of excitatory and inhibitory patterns in neonatal development through use of behavioral ratings and heart rate measurements. This research is part of a long-term study of regulatory principles and mechanisms which govern neonatal behavior (see Bulletin 5, Research Relating to Children).
Subjects: Normal, healthy, 2 to 5 day old full term babies born at Bronx Municipal Hospital Center.

Methods: Heart rate and behavioral ratings obtained for all experimental sessions. Each neonate tested at three sessions: test, retest on reactions to a series of soothing stimuli, and one session of trials of excitatory stimuli. Soothing stimuli applied when neonates are aroused are a tone, rocking, sweetened pacifier inserted in babies' mouths, immersion of babies' feet in warm water, and a control period. Each stimulus condition applied three times. Excitatory stimuli applied after feeding when neonates are quiescent are a tone, cold disc applied to the abdomen, and rocking.
Findings: Data analyzed with respect to (1) relationship between heart rate and behavioral ratings; (2) individual differences in overall soothability and in most effective soothing stimuli; (3) test-retest reliability on successive days; and (4) relationship between excitatory and inhibitory patterns.
Duration: January 1962-continuing.
Investigator(s): Sibylle Escalona, Ph.D., Professor of Psychology in Psychiatry; Wagner H. Bridger, M.D., Assistant Professor of Psychiatry; Beverly M. Birns, Ph.D., and Marion Blank, Ph.D., Instructors in Psychology, Department of Psychiatry, Albert Einstein College of Medicine, Yeshiva University, New York 61, N. Y.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-AA-9 INSTITUTE FOR CHILD STUDY OF PHILADELPHIA

Purpose: To develop standards and norms of physical growth, specific for children of urban Philadelphia. Longitudinal study based on annual or semi-annual follow-up of more than 2,000 children registered at the Institute.
Methods: School Series: initially based on 600 school children in five schools (now 22 schools), ages 6 to 12, "normal" medically and dentally; data collected on national and ethnic background, socio-economic status of parents, medical and dental health history of child, height and weight of parents and siblings, anthropometric measurements and X-rays. American Negro Series: 150 Negro children with normal occlusion selected to study with a view to establishing tentative standards of facial growth. Pilot Study Series: extensive study of 75 children, 6 to 8 years of age, seen every three months for measurements, X-rays, dietetic histories, careful medical examination data, blood chemistry, oral pathology data, etc. Orthodontic Series: all children accepted by Orthodontic Clinic had lateral and postero-anterior head films taken and detailed measurements of head and face made. Orthodontic Treatment Series: a small pilot study of 15 white boys, ages 11 to 15, with a certain type of malocclusion accompanied by V-shaped, high-vaulted palate; 15 with identical orthodontic condition; 15 with normal occlusion--first group to receive free orthodontic care, second and third groups to receive free dental care but no orthodontic treatment. Cleft Palate Series: growth pattern of 250 children with cleft lip and/or palate. Cooley's Anemia Series: family-line investigation of 25 children for traits other than the disease such as faciodental growth dysplasia. Endocrine Series: evaluation of degree of growth deviation with follow-up to study effect of endocrine therapy upon growth pattern. Behavioral Series: 110 first, second, and third graders rated in terms of physical growth progress and simultaneously in terms of grades, emotional stability, and other aspects of classroom behavior to see if there is any real correlation.
Duration: 1947-1967.
Investigator(s): Wilton M. Krogman, Director, Philadelphia Center for Research in Child Growth; and F. E. Johnston, Ph.D., Assistant Professor of Anthropology, University of Pennsylvania, Philadelphia, Pa.

BEST COPY AVAILABLE

Cooperating group(s): Institute for Child Study of Philadelphia (sponsored by Graduate School of Medicine and Evans Institute of Dentistry of University of Pennsylvania and Children's Hospital of Philadelphia); Philadelphia Department of Public Health; Philadelphia Board of Public Education; Public Health Service, U. S. Department of Health, Education, and Welfare.

20-AA-10 GROWTH RESEARCH UNIT

Purpose: To gain insight into critical factors influencing growth patterns of all children by observing the growth and development of deviates, especially those with pathological diagnoses which have been medically documented.
Subjects: Children with congenital cardiac lesions, and children and adolescents with significant deviations of physical, neurological, and behavioral development.
Methods: Inspection, anthropometry, photography, X-ray of the left hand and wrist. Analysis of these basic data for current status and for growth trends.
Duration: 1929-1969.
Investigator(s): Leona M. Bayer, M.D., Co-chairman, Youth Clinic, Presbyterian Medical Center, San Francisco, and Adjunct Clinical Associate Professor of Medicine, Stanford University, Palo Alto, Calif.
Cooperating group(s): Institute of Medical Sciences; Service for Developmentally Handicapped Children.
Publication: *Journal of Clinical Endocrinology and Metabolism* 22:1127-1129, November 1962; *Journal of Pediatrics* 62:5:631-645, May 1963.

20-AA-11 LONGITUDINAL STUDY OF DENTOFACIAL, SKELETAL, PHYSICAL GROWTH AND NUTRITION OF CHILDREN

Purpose: To study the dentofacial growth of children, standards of nutrition, caries increment as related to nutrition, assessment and skeletal age as related to facial growth, variations in physique and its effect on dentofacial growth. Twins are also being studied to determine heritable traits.
Subjects: 400 children, including 40 pairs of twins, ages 3 to 18 years, who have been observed for periods of 3 to 10 years.
Methods: Cephalograms, hand, wrist, and calf X-rays, intra-oral X-rays, study casts, anthropometric measurements, photographs, oral examination, and one-week food diary. Children are examined every six months until 14 years of age.
Initiation date: 1950.
Investigator(s): Bhim S. Savara, D.M.D., M.S., Professor and Head, Child Study Clinic, University of Oregon Dental School, 611 S.W. Campus Dr., Portland 1, Oreg.
Cooperating group(s): University of Oregon Dental School; Oregon State Board of Dental Examiners; Tektronix Foundation, Inc.; Medical Research Foundation of Oregon; National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Recent articles: *Radiology*, April 1961; July 1962. *Journal of Dental Research*, July-August 1961; July-August 1962. *Human Biology*, February and September 1962.

20-AA-12 RADIOGRAPHIC ATLASES OF SKELETAL DEVELOPMENT

Purpose: To develop radiographic standards of skeletal development for use as reference standards for children.
Subjects: 4,483 Cleveland children; 134 Boston children; and a sample of Detroit children.
Methods: Series of films of hand, elbow, shoulder, hip, knee, and foot of healthy children are used to identify the modal (moderate) rate of bone development. Revisions or initial standards are prepared as needed to provide standards of reference.
Duration: 1948-1966.
Investigator(s): S. Idell Pyle, Ph.D., Research Associate, Department of Anatomy, Western Reserve University, Cleveland, Ohio; and William Walter Greulich, Ph.D., Professor and Head, Department of Anatomy, Stanford University, Stanford, Calif.
Cooperating group(s): Bolton Study (Cleveland); Department of Maternal and Child Health, Harvard University School of Public Health.
Publication: Current standards: *Radiographic Atlas of Skeletal Development of Elbow and Shoulder*; *Radiographic Atlas of Skeletal Development of Hip*. The latest standard for the hand was published in 1959; foot in 1962; and knee in 1955.

20-AA-13 COLLABORATIVE STUDIES IN CEREBRAL PALSY AND OTHER NEUROLOGICAL AND SENSORY DISORDERS OF INFANCY AND CHILDHOOD

Purpose: To investigate factors and conditions affecting parents: (1) conditions of pregnancy itself, such as infections, trauma, bleeding, drugs, and progress of labor; (2) environmental factors influencing mother, such as social and economic conditions, emotional stress, and medical care; (3) biological factors in parents such as age, parity, medical and reproductive history, and immunologic characteristics; (4) genetic background of parents. To investigate in the offspring: disorders of the nervous system of all products of conception at time of delivery or appearing during infancy or early childhood, including cerebral palsy, mental subnormality, behavioral disorders, etc. A detailed investigation of the independent variables will be directed toward the re-evaluation of the effect of factors already suspected, the elucidation of the mechanism through which these factors are operative, and the discovery of factors neither presently known nor suspected.
Subjects: Approximately 8,000 live births per year from 15 collaborating institutions for five years. Offspring followed until school age.
Methods: Analysis of pooled information collected in a uniform way in a number of medical centers throughout the country from women studied during pregnancy and from their offspring followed throughout infancy and early childhood. Intensive study of limited number of cases; less intensive study of as many damaged children and abnormal pregnancies as possible.
Initiation date: 1956.
Investigator(s): Richard L. Masland, M.D., Coordinator of Project, National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare, Washington, D. C. Collaborating institutions: Children's Hospital, San Francisco, Calif.; Yale University School of Medicine, New Haven, Conn.; Charity Hospital, New Orleans, La.; Johns Hopkins University School of Medicine, Baltimore, Md.; Boston Lying-In Hospital and Children's Medical Center, Boston, Mass.; University of Minnesota Medical School, Minneapolis, Minn.; Columbia-Presbyterian Medical Center and New York Medical College, New York, N. Y.; University of Buffalo, Buffalo, N. Y.; University of Oregon Medical School, Portland, Oreg.; Children's Hospital of Philadelphia and Pennsylvania Hospital, Philadelphia, Pa.; Brown University, Providence,

R. I.; University of Tennessee Medical School, Memphis, Tenn.; Medical College of Virginia, Richmond, Va.
Publication: *Johns Hopkins Magazine*, June 1959; *Summary of Progress in Collaborative Perinatal Research* (A Nationwide Mother-Child Study), Public Health Service Research Profile No. 9, PHSP No. 1161, 1964.

20-AA-14 METHODS IN CHARACTER DEVELOPMENT

Purpose: To develop more effective methods in character development in cooperation with character training agencies.
Subjects: Children and families in about 30 participating church schools and other groups widely spread in the United States.
Methods: Experimental use of curriculum by participants. Reports of experimental efforts analyzed and curriculum revised on basis of findings. Methods of character education then developed and reported. Emphasis is on character growth in children.
Findings: Anticipate development of instructions for writing character building curricula. These will include types of homes, children, and classes for character development and descriptions of age-level potentials for children.
Initiation date: 1936.
Investigator(s): Ernest M. Ligon, Ph.D., Director, Character Research Project, Union College and University, Schenectady, N. Y.
Cooperating group(s): Lilly Endowment, Inc.
Publication: Published in *Union College Studies in Character Research*. Also *Dimensions of Character*, Macmillan, 1956.

GROWTH AND DEVELOPMENT

General

20-BA-1 THE COORDINATION OF 10 LONGITUDINAL STUDIES USING THE SAME GROUP OF CHILDREN AS SUBJECTS

Purpose: To interrelate findings of 10 investigators using a variety of measures on the same group of children in order to assess these measures in a wide personality framework of development.
Subjects: 120 Toronto children attending the school of the Institute of Child Study, University of Toronto. Subjects are first seen at age of nine months and at annual or semi-annual periods until they reach grade six.
Methods: Each investigator defines and pursues his own study taking it forward to publication. As data are obtained on same group of children, these are pooled in a central data bank and sent to the University Computer Center every six months where means, standard deviations and intercorrelations are obtained. Later factor analysis will be introduced.
Findings: First computer run was completed February 1965, on data obtained at the four year level on 40 four-year olds. These yielded approximately 2,000 intercorrelations between measures such as Binet, Leiter, Peabody, Szondi, Northway-Weld Sociometric, Kephart, Millichamp measure of pre-school mental health, measures of time and space orientation, writing, number concept and word recognition, a measure of creativity, of concept development, and measures of the parents' feeling of adequacy and security. These results have been recorded and are being examined by each individual investigator. At the same time the question of the most appropriate way to release the overall data is being considered.
Investigator(s): Mary L. Northway, Ph.D.; Dorothy A. Millichamp, M.A.; Betty Flint, M.A.; and Bruce Quarrington, Ph.D., Associate Professors of Psychology, Institute of Child Study, University of Toronto, 45 Walmer Rd., Toronto 4, Ont.
Publication: Preliminary statements have been released in the Bulletin of the Institute of Child Study, Nos. 100, 101, 102 and 103. Further plans are to publish each individual study in the appropriate scientific journal, and to release the overall findings for distribution to interested people working in the child development field.

20-BA-2 BEHAVIORAL AND PHYSIOLOGICAL REACTIVITY IN HUMAN NEONATES

Purpose: To test whether individual differences in patterns of reactivity to noxious stimuli are genetically determined.
Subjects: 17 neonates (preliminary study).
Methods: Behavioral measures (rating scale) and physiological measures (heart rate, respiratory rate, galvanic skin resistance and digital systolic blood pressure) of response to loud tones and electric shocks in swaddled newborns were recorded.
Findings: Individual infants were highly consistent in behavioral and physiological response levels across experimental conditions. Physiological variables failed to correlate among themselves. An infant's behavioral level was unrelated to his physiological level.
Duration: January 1965-December 1968.

Investigator(s): Joseph Schachter, M.D., Ph.D., Director, Research Training Program, Department of Psychiatry, and staff, College of Physicians and Surgeons, Columbia University, 722 W. 168th St., New York, N. Y. 10032.
Publication: Submitted to Child Development.

20-BA-3 THE NATURE OF DISTRESS REACTIONS IN INFANCY

Purpose: To describe characteristics of various kinds of crying together with associated autonomic changes, and to study their relations with both organismic and maternal variables.
Subjects: Normal infants from birth up to six months.
Methods: Exploration of methods of recording and measuring behavioral and physiologic variables including use of polygraphy and telemetry.
Findings: Method for establishing individual differences between normal newborns on dimensions related to distress reactivity.
Duration: September 1963-September 1966.
Investigator(s): J. A. Ambrose, Ph.D., Senior Research Psychologist, The Tavistock Institute of Human Relations, 2 Beaumont St., London W1, England.
Cooperating group(s): Medical Research Council, London; National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Publication planned in psychological and pediatric journals.

20-BA-4 KINESTHETIC STIMULATION OF PREMATURE INFANTS

Purpose: To study effects of the experience of prematurity relative to kinesthetic and other kinds of stimulation ordinarily missing.
Subjects: Singleton premature infants and twins.
Duration: November 1965-indefinite.
Investigator(s): Harold Boverman, M.D., Assistant Professor of Psychiatry, and Daniel Freedman, Ph.D., Assistant Professor of Human Development, University of Chicago, Chicago, Ill. 60637. (Reported by John F. Kenward, M.D., Director, Child Psychiatry, University of Chicago.)
Cooperating group(s): University of Chicago; State of Illinois, Department of Mental Health.
Publication: Paper presented at Orthopsychiatry meeting in 1966.

20-BA-5 A STUDY OF GROWTH AND DEVELOPMENT UP TO THE AGE OF FIVE YEARS OF CHILDREN FROM VARIOUS SOCIAL STRATA AND ETHNIC GROUPS IN ISRAEL

Purpose: To study physical, psychosocial, and intellectual growth and development of children in different population groups, from birth to age five; to study child-rearing practices in these population groups; on basis of data found, to study relationships between various aspects of child development and various child-rearing practices; and to investigate nature of differences.
Subjects: Several hundred children from birth to age five, differing in ethnic origin, social class, and educational level; women in third trimester of pregnancy.
Methods: Interviews, clinical examinations, nutritional assessment, anthropometric measurements, psychological observation, and testing.
Duration: Not reported-1971.
Investigator(s): Z. Shamir, M.D., M.P.H., Hadassah Medical School, Hebrew

University; J. Thaustein, M.D., Ministry of Health; and J. Smilansky, Ph.D., Henrietta Szold Research Institute for Children and Youth, Jerusalem, Israel.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

20-BA-6 THE DEVELOPMENTAL ABILITIES OF PRESCHOOL CHILDREN IN TERMS OF SOCIO-CULTURAL RESIDENCE

Purpose: To test some hypotheses about the differential abilities of preschool children in the slum, middle class, and suburban neighborhoods of the greater Cleveland area.
Subjects: 80 children from the inner-urban area; 60 children from the surrounding areas.
Methods: Each group was tested before and following a seven-month nursery school experience. Further follow-up testing is planned. Test battery consists of Peabody Picture Vocabulary Scale, a scale of drawing tasks to measure perceptual motor abilities, and pictures from the Stanford-Binet Intelligence Scale (L-M) to measure quality and extent of verbal expression.
Findings: Results have indicated initial discrepancies between inner-urban and surrounding area children, especially on the verbal tasks. With nursery school experience, the inner-urban group showed significant increases in developmental abilities, but not enough to make up the initial differences.
Duration: September 1964-June 1966.
Investigator(s): Robert M. Frumkin, Ph.D., Director of Research, Community Action for Youth, 1837 E. 79th St., Cleveland 44103; and Donald K. Freedheim, Ph.D., Clinical Psychologist, Mental Development Center, Western Reserve University, Cleveland, Ohio.
Cooperating group(s): U. S. Office of Economic Opportunity.
Publication: Plan to publish a monograph and several papers for professional journals.

20-BA-7 FOLLOW-UP STUDY OF INFANTS FROM BIRTH, WITH PREGNANCY DATA BY INTERVIEW

Purpose: To study relationship between impairments and prenatal events; to study the interrelationship of impairments; and to develop standard research instruments for current and retrospective case histories.
Subjects: 200 infants, every 100th and 200th child born in Lanarkshire and Glasgow.
Methods: Standard interviews every six months with mothers conducted by their regular Health Visitors.
Duration: January 1965-December 1972.
Investigator(s): Denis H. Stott, Ph.D., Lecturer, Department of Psychology, University of Glasgow, Glasgow W. 2, Scotland.
Cooperating group(s): Advisory Committee for Medical Research, Scotland; Health Departments of City of Glasgow and County of Lanark.

20-BA-8 IDENTIFICATION AND EVALUATION OF CHARACTERISTICS OF KINDERGARTEN CHILDREN THAT FORETELL EARLY LEARNING PROBLEMS

Purpose: To identify and evaluate certain sensory and perceptual-motor characteristics of kindergarten children judged prognostic of early

learning problems, and to determine value of intensive specific training on identified characteristics in precluding such difficulty.
Subjects: Seven experimental and seven control kindergarten classes.
Methods: Use of Pintner-Cunningham and Metro-Reading Readiness Tests and 36 Motor-Sensory-Perceptual Tests in pre- and post-test situations; use of specified training program for six months with experimental group; follow-up testing of experimental and control pupils on primary reading and arithmetic achievement.
Duration: Not reported-November 1966.
Investigator(s): William K. Reece, District Psychologist, Rowland School District, Rowland Heights; and Charles E. Meyers, Ph.D., Professor and Chairman, Department of Educational Psychology, University of Southern California, Los Angeles 7, Calif.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-BA-9 A LIMITED LOGICAL ANALYSIS OF PICTURES APPLIED TO STUDY OF CHILDREN'S RESPONSES TO PICTURES

Subjects: 80 children in each age group (four, six, and eight years), randomly assigned to eight cells.
Methods: Experimental task is to match one of four test pictures with sample picture. Dependent variable is number of correct matching responses each subject makes in the case of 10 different sets of pictures. Each set is presented in random order and individually to subjects by rear projection. Correct response is reinforced with candy, incorrect response is corrected by indicating correct picture. Data are analyzed with an analysis of variance.
Duration: Not reported-1965.
Investigator(s): Donald T. Payne, Research Psychologist, Educational Testing Service, Princeton, N. J. 08540.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-BA-10 THE ROLE OF MEDICAL CARE IN THE PREVENTION OF DEVELOPMENTAL DEVIATION IN CHILDREN

Purpose: To test hypothesis that threats to healthy function of neonate influence maternal behavior and subsequently child development at age one.
Subjects: 1,140 infants in Collaborative Child Care Project, born at Pennsylvania Hospital between July 1, 1962 and June 30, 1963, and rated as to presence or absence of morbidity in first week of life.
Methods: Infants' mental, motor, and behavioral development at age one is assessed using interval histories and neurological examinations. Data are rated for behavioral deviation.
Findings: Correlations demonstrate significantly increased rate of deviations at one year in those infants with health threats during first five days of life.
Duration: July 1962-August 1967.
Investigator(s): Henry S. Cecil, M.D., Director, Division of Psychological Pediatrics, and William B. Carey, M.D., Children's Hospital of Philadelphia, 1740 Bainbridge St., Philadelphia, Pa. 19146.
Cooperating group(s): The Grant Foundation; National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Paper expected in Fall 1966.

20-BA-11 ASSESSMENT OF THE PRESCHOOL CHILD

Purpose: To develop measures for an overall assessment of the preschool child.
Subjects: Children ages 4 and 5.
Methods: Measures are being developed in following areas: environmental variables, learning and problem solving, concept formation, language, motor activity, attention and motivation, creativity, and emotional and social behavior. Initial effort will be devoted to identifying and examining existing materials appropriate for those age ranges as well as norms where they exist. New measures will be developed and data will serve as behavioral demography, criterical information for training programs, and possible predictors of school success. Relationship between performance on measures selected and subsequent school performance will be determined.
Duration: January 1966-1968.
Investigator(s): William O. Jenkins, Ph.D., Child Learning and Development, Center for Urban Education, 33 W. 42nd St., New York, N. Y. 10036.

20-BA-12 DEVELOPMENT OF EEG AND BEHAVIORAL RESPONSES TO SENSORY STIMULI

Purpose: To provide basic data on maturation of EEG and sensory evoked potentials of human infants during course of development; to attempt to relate data obtained from psychological and neurological testing with neurophysiological data; and to provide normative data for comparison with that obtained from patients with sensory and neurologic handicaps.
Subjects: A cross-section and longitudinal sample of normal children under three years of age; infants with sensory handicaps; and mentally retarded, mainly mongoloid infants.
Methods: Responses to sensory stimuli are recorded on electroencephalograph; psychological testing for development of form and pattern perception.
Findings: Some characteristics of auditory and visual evoked response in normal infants have been defined; EEG audiometry has been found to be a useful aid in diagnosis of deafness in young infants; electroretinogram of newborn shows *x*-wave component associated with photopic functions; mongoloid infants have sensory evoked responses which are of high amplitude and long latency.
Duration: 1964-1970.
Investigator(s): Ann B. Barnet, M.D., Research Associate in Neurology, Children's Hospital of the District of Columbia, 2125 13th St., N. W.; Ann Lodge, Ph.D., and Rhoda Goodwin, M.A., Research Psychologists, Washington School of Psychiatry, 1610 New Hampshire Ave., N. W., Washington, D. C. 20009.
Cooperating group(s): Department of Sensory Pathology, Division of Neuropsychiatry, Walter Reed Army Institute of Research; National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: *Electroencephalography and Clinical Neurophysiology* 18:441-450, 1965; *Acta Oto-laryngologica* Supplement 206:134-146, 1965; others in preparation.

Physical

20-BD-1 GROWTH STANDARDS FROM 8 TO 14 YEARS OF AGE

Purpose: To develop, if possible, a statistical method for predicting growth in normals which would, if proven, provide a reliable basis for future studies in setting up similar methods in predicting aberrant growth patterns.
Subjects: Boys and girls from 8 to 14 years of age of North European descent exhibiting normal dental-facial growth.
Methods: A longitudinal study of the same individuals using refined cephalometric methods of appraisal.
Findings: For normals, biostatistical evaluations seem highly reliable; however, no check as yet on various ethnic groups or various population samples has been done.
Duration: 1964-indefinite.
Investigator(s): Robert M. Nelson, D.D.S., M.Sc.O., Professor and Chairman, Department of Orthodontics, School of Dentistry, University of North Carolina, Chapel Hill, N. C.

20-BD-2 EFFECT OF NEUROMUSCULAR ACTIVITY ON ACHIEVEMENT AND INTELLIGENCE OF KINDERGARTEN CHILDREN

Purpose: To measure short-term effects of gross and fine neuromuscular activity on kindergarten children.
Subjects: 88 kindergarten children, divided into two control and two experimental groups. Middle and lower socio-economic levels were involved, each furnishing an experimental and a control group.
Methods: Pre- and post-intelligence, readiness, and physical fitness tests are administered. The differences between the gain scores of the equated experimental and control groups are tested for statistical significance. A 2 x 2 analysis of variance was made on the results in each area -- physical fitness, achievement, and intelligence.
Findings: The difference in gains between experimental and control groups was found to be statistically significant in favor of the experimental group. Program emphasis within one experimental group was more in the area of gross neuromuscular skills whereas the other concentrated more on fine neuromuscular skill work. Differences in gain areas are believed to be attributable to this variance.
Duration: September 1964-September 1965.
Investigator(s): Orval M. Conner, Ph.D., Elementary Consultant, Division of Instruction, Battle Creek Public Schools, 73 Capital Ave., N.E., Battle Creek, Mich.
Publication: Articles based on findings are planned.

20-BD-3 EXPERIENCE AND THE DEVELOPMENT OF THE BLINK RESPONSE TO AN APPROACHING VISIBLE TARGET

Purpose: To determine the course of development of the blink response under standard hospital conditions, and to determine whether this development is responsive to environmental factors.
Subjects: 90 normal infants born and reared in a state institution.

Methods: Blink responses are elicited under standard conditions and objectively recorded simultaneously with a record of stimulus activity. Groups of infants are reared under systematically altered conditions.
Findings: Blink responses to visible stimuli do not appear with regularity before 6 to 8 weeks of age and seem to be obligatory by 12 to 14 weeks.
Duration: January 1965-April 1967.
Investigator(s): Burton L. White, Ph.D., Research Associate, Graduate School of Education, Harvard University, Cambridge, Mass.
Cooperating group(s): Massachusetts Institute of Technology; National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Results will be submitted for publication as they become available.

20-BD-4 THE INFLUENCE OF ENVIRONMENTAL FACTORS UPON THE OSSEOUS DEVELOPMENT OF THE WRIST AND HAND OF INFANTS AND PRESCHOOL CHILDREN

Purpose: To determine the effects of maternal health, size at birth, rate of growth, nutrition status, and significant illness on the osseous development of the wrist and hand of Negro infants and preschool children.
Subjects: More than 400 young children of 167 mothers representative of a stable population of Negroes that avail themselves of the health services of the Alachua County Health Department. All children were entered at birth or were siblings less than six years of age when study was initiated.
Methods: Longitudinal data on stature, weight, and other anthropometric measurements are collected on subjects for six years. Total health and personal histories, dietary patterns, nutritional status evaluations, and series of hand X-rays are obtained at three month intervals during first year of life and annually thereafter. Socio-economic and physical health data are obtained on family groups. Data are recorded on IBM cards and analyzed by computer.
Findings: Growth in stature and weight of Negro children from birth to six years of age approximates standards based on Iowa white children in good health when nutritional requirements are met, and is not significantly different when moderate degrees of inadequacy are experienced. Skeletal maturation is a more sensitive indicator of nutritional deficiency.
Duration: January 1958-January 1968.
Investigator(s): Ruth O. Townsend, R.N., B.S., Assistant in Nutrition, and Roland B. French, Ph.D., Biochemist, Department of Food Technology and Nutrition, Agriculture Experiment Station, University of Florida, Gainesville, Fla.
Cooperating group(s): Alachua County Health Department; Department of Anatomy, J. Hillis Miller Health Center, University of Florida.
Publication: Series of publications planned in appropriate journals.

20-BD-5 VISUAL DISCRIMINATION IN THE HUMAN NEWBORN

Purpose: To specify dimensions of stimulation discernible to human newborn two to three days of age.
Methods: Measurements are taken of relative positions of corneal reflections of various stimuli relative to that of pupil to determine degree of fixation. This is accomplished by electronic recording and analysis of eye movements and fixations in a paired-comparison preference design.
Duration: January 1965-December 1967.
Investigator(s): Maurice Hershenson, Ph.D., Assistant Professor of Psychology, University of Wisconsin, Madison, Wis. 53706.

Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-BD-6 OPERANT CONDITIONING OF EYE MOVEMENTS IN INFANTS

Purpose: To obtain operant conditioning of visual fixation in infants.
Subjects: 80 infants 13 to 14 weeks of age.
Methods: Differential reinforcement of fixation with respect to two spatial positions; recording of direction of regard during an eight-minute session involving a preconditioning, a conditioning, a reverse contingency, and an extinction period. Periods are consecutive and last two minutes each.
Duration: September 1964-August 1965.
Investigator(s): John S. Watson (Doctoral Candidate, Cornell University), Research Associate, and Irving E. Sigel, Ph.D., Chairman, Department of Research, Merrill-Palmer Institute, 71 E. Ferry Ave., Detroit, Mich. 48202.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-BG-1 A STUDY OF CERTAIN FACTORS RELATED TO THE ACCEPTANCE BY SIXTH GRADE CHILDREN OF CAROTENOID-RICH VEGETABLES

Purpose: To find factors related to acceptance of vegetables which may be used as a basis for an educational program through the school lunch to increase the intake of carotenoid-rich vegetables, lacking in diets of many Iowa children.
Subjects: 59 sixth grade children in a city public school who participate in the school lunch program.
Methods: On the basis of 23 daily observations of the acceptance of vegetables in the lunch, the 59 children were classified into three groups. Three standard psychology tests were administered to obtain information on certain personality traits: flexibility, adventuresomeness, and personal and social adjustment. Information was obtained from school records regarding family background and child's height-weight record. A checklist of foods classified as salty, sweet, sour or bitter was used to determine children's preferences for foods with these four basic tastes. Broccoli or sweet potatoes prepared and seasoned in a variety of ways was served to the children who indicated their preferences and reasons for their reactions.
Duration: October 1965-June 1966.
Investigator(s): Sue Ann Hixson, Graduate Assistant; Maxine Hinton, Ph.D., Associate Professor of Food and Nutrition; and Ercel Eppright, Ph.D., Assistant Dean and Director of Research, Iowa State University, Ames, Iowa 50010.
Cooperating group(s): Agricultural and Home Economics Experiment Station.
Publication: Plan to publish.

20-BG-2 DIETS AND NUTRITURE OF PRESCHOOL CHILDREN IN LOW AND MIDDLE INCOME FAMILIES

Purpose: To determine nutritional situation of two- and three-year old children in longterm, low income families and children of same ages in higher income families having similar ethnic backgrounds. To investigate relationship of children's nutriture to their earlier and current diets

and health; their mothers' age, education, employment outside home, and attitudes toward feeding young children; and their families' food management practices in the home.
Subjects: Approximately 250 two- and three-year old children in longterm low income families of Hawaiian ancestry and children of same ages in higher income families having similar ethnic backgrounds in Honolulu.
Methods: Information is obtained on socio-economic characteristics and food management practices of the family by home interview, and on food intake of the child by a food record. After completion of food record, each child will be given a clinical examination by a physician and a psychometer test for mental development. Urine and blood samples will be collected for analysis.
Duration: March 1966-1970.
Investigator(s): Sadye F. Adelson, M.S., Chief, Food Consumption Branch, Consumer and Food Economics Research Division, U. S. Department of Agriculture, Hyattsville, Md. 20782; and Myrtle Brown, Ph.D., Head, Division of Nutrition, College of Tropical Agriculture, University of Hawaii, Honolulu, Hawaii. (Reported by Faith Clark, Director, Consumer and Food Economics Research Division.)
Publication: Journal articles planned.

20-BG-3 NATIONWIDE SURVEY OF FOOD INTAKE OF INDIVIDUALS (CHILDREN AND ADULTS), SPRING 1965

Purpose: To provide current information on food and nutrient intake of a nationwide sample of individuals.
Subjects: All infants and other children among approximately 13,000 individuals in base sample of households drawn for nationwide survey of food consumption.
Methods: Trained interviewers obtain information in home interviews on prepared schedule forms on: kinds and amounts of food eaten at home and away from home during day preceding interview; time of day at which meals and snacks were eaten; place where food that was not from home food supplies was eaten; cost of purchased meals and snacks eaten away from home; and certain socio-economic characteristics of the family. Nutritive value of the diets will be calculated using tables of food composition; classification and tabulation will be by age and sex of individual, region, degree of urbanization, income class of family, and other characteristics.
Duration: November 1964-1969.
Investigator(s): Sadye F. Adelson, M.S., Chief, and Beryl G. Becker, M.S., Nutrition Analyst, Food Consumption Branch, Consumer and Food Economics Research Division, U. S. Department of Agriculture, Hyattsville, Md. 20782. (Reported by Faith Clark, Director, Consumer and Food Economics Research Division.)
Publication: U. S. Department of Agriculture bulletins, journal articles, other.

20-BJ-1 A LONGITUDINAL STUDY OF SKELETAL GROWTH OF PREMATURES

Purpose: To investigate growth of prematures, including increments of growth, from birth through five years of age, and hopefully through adolescence.
Methods: Accumulation of data to establish distance and velocity curves for growth of premature infants born at varying gestational ages and in varying birthweight groups.
Duration: 1962-1967.

803

Investigator(s): Mary O. Cruise, M.D., Assistant Professor of Pediatrics, and Newton Scatchard, M.D., Clinical Professor of Radiology, Children's Hospital, 219 Bryant St., Buffalo, N. Y. 14222.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-BJ-2 A STUDY OF THE EXTENSIBILITY AND THICKNESS OF THE HUMAN CHEEK

Purpose: To compare force exerted against maxillary left first molar by cheek at rest with muscle extensibility in twin and nontwin children aged 5 to 16 years.
Subjects: 12 sets of similar twins; 10 sets of dissimilar twins.
Methods: Application of a mechanical device to deform cheek by means of a plunger, activated by weights riding over a pulley. Cheek thickness is measured with a specially modified Harpenden caliper. Minimal maxillary breadth is measured from A-P cephalograms, and bimolar breadth from dental impressions.
Findings: Resting force correlated significantly with stiffness factor; it did not correlate significantly with age, but stiffness factor did. Bimolar breadth and minimal maxillary breadth were correlated with each other, but not with resting force or stiffness factor. Insignificant differences appeared between similar and dissimilar twins on all variables.
Duration: June 1964-June 1965.
Investigator(s): Stanley M. Franklin, D.D.S., M.S.D., College of Dentistry, University of Nebraska, Lincoln, Nebr. 68508. (Reported by Edward I. Fry, Ph.D., Associate Professor of Anthropology, University of Nebraska.)
Cooperating group(s): Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Available at Dental College Library, University of Nebraska, Lincoln.

20-BJ-3 FOOD-SOIL-CARIES RELATIONSHIPS

Purpose: To determine whether caries prevalence in children is related to soil types, as has been indicated in the New Zealand Study.
Subjects: School children ages 8 to 12.
Methods: Samples of school children with a life-long residence in areas of contrasting soil types as designated by the Plant, Soil, and Nutrition Laboratory of the U. S. Department of Agriculture will be examined by a single examiner to determine relative caries prevalence.
Duration: November 1965-November 1967.
Investigator(s): Basil G. Bibby, D.M.D., Ph.D.; Thomas G. Ludwig, B.D.S., M.S.; and Fred L. Losee, D.D.S., M.S., Eastman Dental Center, 800 Main St. East, Rochester, N. Y. 14603.
Cooperating group(s): U. S. Department of Agriculture.

20-BM-1 MOTOR PERFORMANCE TESTING OF ELEMENTARY SCHOOL AGE CHILDREN

Purpose: To test and analyze motor performance of boys and girls in grades one through six.
Subjects: 2,840 boys and girls enrolled in 22 selected public schools in Minnesota.

Methods: Students were observed in physical education classes for ability in overhand throw for distance, wall pass, soccer punt, soccer wall volley, volleyball serve, softball pitch for accuracy, short potato race, pull-ups, jump and reach, rope skipping, sit-ups, Hanson Shoulder Test, modified Bass Balance Test, 50-yard dash, broad jump, and the 600-yard walk-run.
Findings: Within grades, boys were generally superior to girls in motor performance with exception of rope skipping and balance. When evaluated by sex, children in one grade were generally superior in performance to those in the grade below.
Duration: March 1963-August 1965.
Investigator(s): Margie R. Hanson, Ph.D., Elementary Consultant, American Association for Health, Physical Education, and Recreation, 1201 16th St., N.W., Washington, D. C. 20036.
Cooperating group(s): State of Minnesota; Jay Phillips Foundation, St. Paul, Minn.
Publication: Research Quarterly, 1966; State of Minnesota Curriculum Guide of Elementary Physical Education will carry percentile norms for 16 motor tests.

Perceptual

20-BP-1 ADAPTATION AND PERCEPTION IN EARLY INFANCY

Purpose: To study relationships between infant-caretaker interaction and development of attentive perceptual functions in first two months of life.
Subjects: 30 healthy neonates of normal gestation and delivery.
Methods: Comparison of variables in four different caretaking environments by means of automatic 24-hour interactional monitoring and special methods for assessing both quantitative and qualitative dimensions of infant perceptual function.
Duration: September 1965-August 1969.
Investigator(s): Louis W. Sander, M.D., Associate Research Professor of Psychiatry, and Gerald Stichler, Ph.D., Assistant Research Professor of Psychiatry, Medical Center, Boston University, 80 Concord St., Boston, Mass.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-BP-2 HEREDITARY FACTORS IN THE PERFORMANCE OF PERCEPTUAL MOTOR TASKS

Purpose: To determine degree of genetic control of perceptual motor tasks in twins.
Subjects: 45 pairs of like-sexed twins from Atlanta, Georgia, 33 identical, and 12 fraternal: 32 boys and 58 girls, 40 Negro and 50 white, age 13 to 18 years.
Methods: Administration of a battery of tests: Surface Development Test, Mazes, Newcastle Spatial Test, Paper Folding Test, Identical Pictures Test, Object-Aperture Test, and Cube Comparisons.
Findings: Heredity and environment produce significantly greater differences in fraternal twins on mental tests of visualization, perceptual speed, and spatial orientation than environmental influences alone produce in identical twins.
Investigator(s): R. Travis Osborne, Ph.D., Professor of Psychology, University of Georgia, Athens, Ga.; and A. James Gregor, Ph.D., University of Kentucky, Lexington, Ky.

20-BP-3 FACIAL REACTIONS TO SIMPLE STIMULI IN THREE-DAY OLD HUMAN INFANTS

Purpose: To determine facial reactions of infants to the odor of acetic acid and to the withdrawal of a nipple.
Subjects: 12 infants, three-days of age at Naval Medical Hospital.
Methods: 16mm motion picture films taken of infants while they are exposed to acetic acid or while a nipple on which they are sucking is removed from the mouth. Ratings are made from films by two independent judges.
Findings: There is a difference in facial expression reactions to these two situations.
Duration: 1963-not reported.
Investigator(s): Robert Plutchik, Ph.D., Hofstra University, Hempstead, N. Y.; and Richard Q. Bell, Ph.D., Laboratory of Psychology, National Institute of Mental Health, Bethesda, Md.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Plan to submit for publication in fall 1966.

20-BP-4 DEVELOPMENTAL STUDIES OF VISUAL SCANNING DISJUNCTIVE REACTION TIME, AND INFORMATION PROCESSING

Purpose: To throw light on problems of perceptual development.
Subjects: Second grade through adults.
Duration: Partially completed.
Investigator(s): Eleanor J. Gibson, Ph.D., Senior Research Associate, Department of Psychology, Cornell University, Ithaca, N. Y.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-BP-5 DEVELOPMENT OF VISUAL FORM PERCEPTION IN THE HUMAN INFANT

Purpose: To attempt to systematically relate infant visual form discrimination ability to selected quantitative dimensions of two-dimensional shapes; to study development of form perception with infants at different ages; and to compare ability of infants to discriminate form with that of human adults and various subhuman subjects.
Subjects: 15 to 20 infants between four and six months old.
Methods: Apparatus allows for selection of projected visual material through a simple motor response by infant. Subject is provided a control lever which, when moved to right or left, activates a slide projector, thereby selecting one or the other of a pair of stimuli for viewing. Number of times a stimulus is selected and time spent viewing each stimulus are recorded. Subjects are conditioned to operate control lever by using monochromatic stimuli so that naivete relative to random forms is maintained. Twenty pairs of stimuli are used, five at each of four levels of complexity.
Duration: Not reported-April 1969.
Investigator(s): Donald R. Brown, Ph.D., Department of Psychology, Purdue University, Lafayette, Ind.

20-BP-6 FACTS OF NORMAL VISION IN READING OR LEARNING DEFICIT

Purpose: To relate perceptual mechanisms, whose existence has been

established by previous studies, to performance on reading, learning, and other perceptual tasks; to investigate individual differences in performance by selecting discrete samples for intensive analysis from large-N studies.
Methods: Analysis of reading and learning performance of subjects who apparently scan a tachistoscopic binary visual pattern from right to left rather than in the usual left-to-right direction for English-reading people.
Duration: June 1965-May 1968.
Investigator(s): E. Rae Harcum, Ph.D., Associate Professor of Psychology, College of William and Mary, Williamsburg, Va. 23185.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-BP-7 EIDETIC IMAGERY IN CHILDREN

Purpose: To continue longitudinal study of eidetic children in New Haven, retesting them yearly; to obtain a new sample of eidetic children in Rochester, N. Y., both to provide more children for investigation, and to make these children available for participation in some laboratory studies of perception, imagery, and memory; and finally, to undertake a systematic cross-cultural study in Ghana, West Africa, to investigate nature of imagery in more detail, its prevalence in relation to acculturation, and how it correlates with other perceptual and cognitive tasks, especially how it is used as a replacement or supplement for reading skills.
Subjects: 12 eidetic children.
Methods: Detailed procedures are described to test for presence of eidetic imagery in children, including showing each child a number of colored patches and then pictures, tape recording all they describe, of images and of their memory of stimuli. Interviews follow standard formats, concentrating on relation of child's eidetic imagery to rest of his development. African study is modelled after one completed in Nigeria, which followed these procedures with appropriate modifications.
Duration: March 1965-February 1967.
Investigator(s): Ralph N. Haber, Ph.D., Professor, and Ruth B. Haber, Ph.D., Research Associate, Department of Psychology, University of Rochester, Rochester; and Margaret Feldman, Ph.D., Research Associate, Institute of Child Development, Cornell University, Ithaca, N. Y.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

Communication

20-BU-1 THE RELATIONSHIP OF CHILD LANGUAGE TO LINGUISTIC LEVELS

Purpose: To test for discrepancy between a scientifically correct analysis and the actual "natural facts" with particular regard to separation of linguistic levels.
Subjects: Investigator's own children and others.
Methods: Collection of data by passive observation and induced experiment.
Findings: There seems to be concordance between linguistic analysis and "natural" data.
Duration: 1965-indefinite.

Investigator(s): Walburga von Raffler Engel, Ph.D., D.Litt., Visiting Associate Professor of Linguistics, Vanderbilt University, Nashville, Tenn. 37203.

20-BU-2 EFFECTS OF SPEECH STIMULI UPON INFANT VOCAL BEHAVIOR

Purpose: To define categories of language stimuli which influence vocal behavior of infants under one year of age.
Subjects: Eight-month old children drawn from local hospital birth lists.
Methods: Subjects were permitted to hear playback of their own vocal responses 3.75 seconds following emission of responses. Comparisons with spontaneous vocal play show that when subjects demonstrate rate increases during self-sound feedback, more high frequency components appear in their vocal responses. A second study involved presentation of selected vowel and consonant sounds to eight-month old subjects.
Findings: Compared with spontaneous vocal responses, behavior changed during treatment periods. During stimulation with vowels subjects reduced proportion of vowel responses; during stimulation with consonants subjects reduced proportion of consonant responses.
Duration: June 1965-June 1966.
Investigator(s): Ronald L. Webster, Ph.D., Assistant Professor of Psychology, Hollins College, Hollins College, Va.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Results to be submitted for publication during summer 1966 to a journal not yet selected.

20-BU-3 WORD ASSOCIATIONS OF YOUNG CHILDREN

Purpose: To study vocabulary development of young children.
Subjects: Intercity Negro and white children of low socio-economic status.
Methods: Samples of children matched on I.Q., grade level, and sex; word association responses sorted and analyzed by digital computer.
Duration: September 1965-August 1966.
Investigator(s): Doris R. Entwisle, Ph.D., Assistant Professor of Engineering Science and of Social Relations, Johns Hopkins University, Baltimore, Md. 21218.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Psychological Reports 13:291-299, 1963; Journal of Verbal Learning and Verbal Behavior 3:19-29, 1964; Sociometry 29:67-84, 1966; Journal of Verbal Learning and Verbal Behavior, in press.

20-BU-4 HESITATION PHENOMENA IN INFORMAL SPEECH

Purpose: To discover psycholinguistic units of encoding.
Subjects: 10,000 words of informal speech of fifth graders.
Methods: Location of five classes of hesitation phenomena in terms of form classes and possibly rough syntactic position.
Duration: February-November 1966.
Investigator(s): Marion A. Wenger, Ph.D., Professor, and Margaret Hubbard Jones, Ph.D., Research Psychologist and Lecturer, University of California

at Los Angeles, Los Angeles, Calif. 90024.
Cooperating group(s): Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: To be submitted to a psychological journal; report will be available from investigators about December 1, 1966.

20-BU-5 LINGUISTIC DIFFERENCES BETWEEN BILINGUAL MEXICAN-AMERICAN CHILDREN AND MONOLINGUAL ANGLO-AMERICAN CHILDREN

Purpose: To illustrate linguistic differences between these two groups of children as determined by several linguistic measurements.
Subjects: 80 second grade public school pupils.
Methods: Four subtests of Illinois Test of Psycholinguistic Abilities are administered; subjects are then stimulated with pictures to obtain 50 verbal responses, which are analyzed according to mean length of response, one-word responses, and complexity of verbalizations to allow comparison with other studies on language development.
Duration: February-June 1966.
Investigator(s): Bonnie Olpin, M.A., Student, and T. D. Hanley, Ph.D., Speech and Hearing Clinic, University of California at Santa Barbara, Santa Barbara, Calif. 93103.

20-BU-6 DEVELOPMENT OF COMMUNICATION SKILLS PROJECT

Purpose: To foster development of communication skills with inarticulate children unable to use psychotherapy.
Subjects: Four boys and two girls, ages 10 to 12 years.
Methods: A modified form of creative dramatics, led by a speech teacher for a total of 42 sessions over a five-month period. Tape recordings were made of each session, and observations were made through a one-way mirror.
Findings: Children showed increased range and depth of expression, greater spontaneity, and developed an increased capacity to communicate inner fantasy activity.
Duration: December 1964-October 1965.
Investigator(s): Marvin I. Shapiro, M.D., Clinical Associate Professor of Child Psychiatry, Department of Psychiatry, University of Pittsburgh Medical School, and Pittsburgh Child Guidance Center, 201 Desota St., Pittsburgh 13, Pa.
Cooperating group(s): Department of Speech, University of Pittsburgh; The Maurice Falk Medical Fund.
Publication: Final project report will be made to Falk Foundation.

20-BU-7 RECEPTIVE AND EXPRESSIVE CONTROL OF THE PLURAL IN HEAD START YOUNGSTERS

Purpose: To ascertain preschoolers' understanding of inflectional endings for plural; to assess preschoolers' use of plural inflectional endings.
Subjects: Children in Washington, D. C. Head Start Programs.
Methods: Materials designed to elicit child's one-word response regarding singular or plural are presented to each child individually. A receptive as well as an expressive task is presented. Imitative and generative scores are obtained.
Findings: There appears to be a difference between receptive control and expressive use of certain inflectional endings in the groups tested.

Duration: November 1965-September 1966.
Investigator(s): Joan C. Baratz, Ph.D., Assistant Professor, Department of Speech, University of Maryland, College Park, Md.
Cooperating group(s): Head Start projects in the District of Columbia area.
Publication: Submitted to American Speech and Hearing Association 1966 convention.

20-BU-8 PATTERNS OF PSYCHOLINGUISTIC DEVELOPMENT DURING EARLY AND MIDDLE CHILDHOOD

Purpose: To investigate the validity of the "differentiation hypothesis" within the context of the development of psycholinguistic abilities between two and nine years.
Subjects: Children between the ages of two and nine years.
Methods: Individual testing with the Stanford-Binet and all the nine subtests of the Illinois Test of Psycholinguistic Abilities. Factor analysis used to discern changes in patterns of abilities from age to age.
Findings: General ability becomes more and more restricted in its comprehensiveness as the age advances while group abilities become gradually more pronounced.
Duration: February 1965-March 1966.
Investigator(s): Mohammed Y. Quereshi, Ph.D., Associate Professor of Psychology, Marquette University, Milwaukee, Wis.
Publication: Submitted to *Educational and Psychological Measurement*.

20-BU-9 MONITORING OF VERBAL BEHAVIOR

Purpose: To assess effects of introducing objective recording devices of which a subject is aware upon his subsequent behavior.
Methods: A portion of spontaneous daily verbal behavior of children is monitored, using a miniature radio transmitter, microphone, and tape recording system. Analysis of both structural and dynamic aspects of conversation is carried out over time to observe degree to which adaptation to instruments occurs. In addition, children's speech is recorded during experimental sessions under two conditions--when child is aware that his speech is being recorded, and when he is unaware.
Investigator(s): Kenneth Purcell, Ph.D., Director, and Kirk Brady, M.A., Research Clinical Psychologist, Behavior Science Division, Children's Asthma Research Institute and Hospital, 3401 W. 19th Ave., Denver 4, Colo.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-BU-10 DELAYED FEEDBACK AUDIOMETRY

Purpose: To determine effects of delayed auditory feedback of vocalizations on patterns of speech motor activity during first few years of life.
Methods: Will study delayed auditory feedback of infant cries, proceeding through stages of babbling, imitative vocalization, and early grammatical refinement of speech communication; will use information about effects of delayed auditory feedback to develop new techniques for evaluation of hearing acuity in infancy and early childhood.
Investigator(s): Richard Allen Chase, M.D., Assistant Professor of Psychiatry and Director, Neurocommunications Laboratory, School of

Medicine, Johns Hopkins University, Baltimore, Md. 21205.
Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.

20-BU-11 EXPANSION TRAINING AND THE CHILD'S ACQUISTITION OF GRAMMAR

Purpose: To determine effects of expansion training and of simple exposure to well-formed sentences on the child's acquisition of grammar.
Subjects: Girls, 30 to 36 months old, single children of parents with less than a high school education. Subjects are selected at about the same level of grammatical development initially.
Methods: Subject's telegraphic utterance is "expanded" by adding to the content words she speaks those functors (articles, prepositions, inflections, conjunctions, pronouns, and auxiliary verbs) which result in a simple sentence appropriate to the total situation. One group is given intensive and deliberate expansion training; another group has intensive exposure to well-formed sentences; a third group receives no special training. After a three-month period, grammatical development of two training groups and control group is compared from test data and analysis of spontaneous speech samples.
Duration: 1964-December 1965.
Investigator(s): Roger W. Brown, Ph.D., Professor of Social Psychology, and Mrs. Courtney Cazden, Research Assistant, Department of Social Relations, 1270 William James Hall, Harvard University, Cambridge, Mass. 02138.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

Intellectual

20-CA-1 FORM-COPYING ABILITY OF KINDERGARTEN CHILDREN

Purpose: To define and describe characteristics of young children's form-copying ability and to determine rate of change in this ability.
Subjects: 140 kindergarten children, 74 boys and 66 girls, for whom results were available for all four tests. Chronological age range was 57 to 69 months; mean age was 63.35 months.
Methods: Bender Gestalt Test was administered as a group test in September, November, February, and May of the kindergarten year. Protocols were scored with an objective rating scale and analyzed for presence of eight performance characteristics, with emphasis on definition and description of rate and kinds of changes in copying ability.
Findings: There was clear and significant improvement in performance on the Bender during the kindergarten year. Means and standard deviations for the four administrations were 25.31 (3.07), 26.83 (2.12), 26.51 (2.04), and 27.51 (2.04). Analysis of variance revealed significant differences between means for administrations I and II, I and IV, and III and IV (P= .01). Correlation of total scores between administrations were all significant (P= .01), with magnitude of Pearson r ranging from .55 to .65. Girls were favored on the first administration.
Duration: September 1963-November 1965.
Investigator(s): Barbara K. Keogh, Ph.D., Psychologist, Children's Hospital, Los Angeles; and Carol E. Smith, Ph.D., System Development Corporation, Los Angeles, Calif.

811

Cooperating group(s): Manhattan Beach, California, Elementary School District.
Publication: Planned in appropriate psychological or educational journal.

20-CA-2 LOGICAL THINKING IN SECOND GRADE

Purpose: Drawing on theoretical formulations and experiments of Piaget, to test the effects on logical thinking in the second grade, of instruction in kindergarten in the basic concepts of mathematics and science.
Subjects: 650 children in five school systems in New York and California.
Methods: Individual interviews derived from Piaget; classroom observations; teacher questionnaires.
Duration: September 1965-August 1968.
Investigator(s): Millie Almy, Ph.D., Professor of Psychology and Education, Teachers College, Columbia University, New York, N. Y. 10027.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-CA-3 ACQUISITION OF GEOGRAPHIC CONCEPTS: PERSPECTIVE ABILITY IN CHILDREN

Purpose: To develop appropriate measuring procedures and instruments for determining level of perspective ability among children ages five through 12 years; to begin the establishment of a baseline set of norms for American children of the present time and to compare these with the findings of Piaget in his work with European children; to explore the range of individual differences among children in their acquisition of perspective ability; and to develop additional hypotheses for further research which can contribute to understanding and better teaching of geographic concepts in the elementary school social studies program.
Subjects: 150 children, ages five through 12 years; 73 children were retested in a reliability study making a total of about 225 test scores available for analysis and interpretation.
Methods: A three-dimensional map of a fictitious island group was constructed and mounted on an adjustable circular table. Children were shown photographs taken from various positions around the outer edge of the map and asked to identify where the camera had to be when each photograph was taken. Scoring was based on the amount of error from the correct position of the camera for that picture. Two kinds of total scores were available for analysis, one showing overall tendency to make errors to the left or to the right and another showing gross error. In addition, background information was gathered on each child and amount of time consumed in the test was recorded along with anecdotal comments concerning the child's strategies in the perspective test situation.
Findings: In confirmation of the work by Piaget, pilot investigations indicate that most children in the nine through 12 year age range have a fairly well developed perspective ability. The sharpest break seems to occur between children in kindergarten and first grade and those who are enrolled in third grade and above.
Duration: January 1966-August 1969.
Investigator(s): Jack W. Miller, Ed.D., Professor of Elementary Education, School Learning Institute, John F. Kennedy Center for Research on Education and Human Development, George Peabody College for Teachers, Nashville, Tenn.
Cooperating group(s): Carnegie Corporation.
Publication: A preliminary publication is anticipated for 1967; later publication will be made as results of investigation become available.

20-CA-4 INTELLECTUAL DEVELOPMENT AND ORPHANAGE EXPERIENCE

Purpose: To answer two questions: (1) Will increasing variability of auditory and visual input during first year decrease degree to which infants in an orphanage are retarded?; and (2) will adolescents raised in same orphanage setting show greater intellectual defects than family-reared children?
Subjects: Children in an orphanage in Teheran where an earlier study found 60 percent of two-year olds not sitting up alone and 85 percent of four-year olds not walking alone.
Methods: Provide variations of stimulation by tape recordings and mobiles in order to compare ages at which various Piaget-observed schemata appear in stimulated infants and in infants developing in customary fashion of this orphanage; compare performances of a sample of orphanage-reared adolescents with those of a sample of family-reared adolescents of Teheran on following measurements: Piaget's procedures for uncovering concrete and formal operations, Raven's Progressive Matrices, a translation of Wechsler-Bellevue Children's Scale, Smedslund's test of concrete intelligence adapted from Piaget and, possibly, Cattell's (1940) culture-fair test of intelligence.
Duration: 1965-1969.
Investigator(s): J. McVicker Hunt, Ph.D., Professor of Psychology, University of Illinois, Urbana, Ill. 61803; and Parvin Birjandi, Ph.D., Assistant Professor of Psychology and Dean of Women, University of Teheran, Teheran, Iran.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-CA-5 THE DEVELOPMENT OF SET

Purpose: To test several hypotheses regarding preparatory set, defined by a curve relating simple auditory reaction time as a function of preparatory intervals (RT x PI function).
Methods: Set is examined at various age levels from six through 19, with five values of PI's (the intervals between an alerting signal and a reaction signal).
Duration: 1965-1967.
Investigator(s): Rogers Elliott, Ph.D., Assistant Professor of Psychology, Dartmouth College, Hanover, N. H.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-CD-1 PASSIVITY AND STYLES OF THOUGHT IN CHILDREN

Purpose: To study growth of cognitive dimensions during first four years of life.
Subjects: 160 first-born, Caucasian infants.
Methods: Longitudinal study of perceptual functioning, play behavior, language, and quality of interaction with mother.
Findings: Educational level of parent is positively related to level of cognitive development at 8 to 12 months of age.
Duration: September 1964-1969.
Investigator(s): Jerome Kagan, Ph.D., Professor of Psychology, Harvard University, Cambridge, Mass.
Cooperating group(s): National Institute of Mental Health, National

Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Journal of Personality and Social Psychology 2:154-160, 1965; Merrill-Palmer Quarterly 11:95-127, 1965; J. D. Krumboltz (Ed.), Learning and the Educational Process, Chicago: Rand McNally, 1965, pp. 133-161; Child Development 36:609-628, 1965; Journal of Abnormal Psychology 71:17-24, 1966; Journal of Personality 34:118-128, 1966; three other articles in press.

20-CD-2 THE ELICITATION OF COGNITIVE COPING IN THREE-YEAR OLD NURSERY SCHOOL CHILDREN

Purpose: To discover what areas of nursery school, which toys, or types of equipment serve as stimuli to elicit cognitive coping among three-year old children during free play periods.
Subjects: 20 three-year old nursery school children, aged 36 to 43 months.
Methods: Observation utilizing technique of psychological ecology with specimen descriptions of subjects' activities. Ecology of each child's activities during free play period is plotted on a prepared map in reference to time spent in each area. Specimen descriptions are coded for analyses according to predetermined "cognitive coping" categories.
Duration: October 1965-May 1966.
Investigator(s): Vladimir de Lissovoy, Ph.D., Associate Professor of Child Development and Family Relationships, Pennsylvania State University, University Park, Pa.
Publication: To be submitted to Child Development.

20-CD-3 RELATIONSHIP OF MOTHERS' LANGUAGE STYLES TO THE COGNITIVE STYLES OF URBAN PRESCHOOL CHILDREN

Purpose: To develop language style scales for analysis of language styles of mothers of differing social class groups; to assess social class differences in mothers' language styles; and to analyze relationship between mothers' language styles and their children's cognitive styles and I.Q.'s.
Subjects: 160 Negro mothers and their four-year old children.
Methods: Language samples are obtained from two projective tests given mothers, mothers' language in teaching their children a simple task, and mothers' account of a "typical day". Language scores derived from these samples are correlated with children's cognitive styles, using a cognitive sorting task developed by Kagan, Moss, and Sigel, and with the children's Stanford-Binet I.Q.'s.
Duration: September 1964-September 1965.
Investigator(s): Ellis G. Olim, Ph.D., Hampshire House, University of Massachusetts, Amherst, Mass.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-CG-1 CENTER FOR RESEARCH AND DEVELOPMENT FOR LEARNING AND RE-EDUCATION

Purpose: To improve the efficiency of learning in school and informal situations; to increase knowledge about cultural deprivation and problems of re-education.

Subjects: Children and youth of school age; some adults.
Methods: Controlled experiments in university laboratories and schools; development and field testing of instructional procedures; dissemination through centers for observation, through conferences, teacher education programs, graduate programs.
Duration: September 1964-August 1973.
Investigator(s): Herbert J. Klausmeier, Ed.D.; Chester W. Harris, Ph.D.; and Julian C. Stanley, Ed.D., Professors of Educational Psychology; Burton W. Kreitlow, Ph.D., Professor of Adult Education, and Henry Van Engen, Ph.D., Professor of Mathematics; University of Wisconsin, Madison, Wis. 53706.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: All means of publication are anticipated: books, monographs, articles, newsletters, etc.

20-CG-2 DISCRIMINATION LEARNING IN CHILDREN

Purpose: To investigate discrimination learning and concept formation in children in order to discover the processes underlying such learning and the conditions which control their occurrence. Specifically, project is concerned with mediating processes and factors (developmental or external) which are related to their use.
Subjects: Children, ages five to 11.
Methods: Use of a two-choice, simultaneous discrimination problem and transfer problems involving similar problems (similar in methodology though not necessarily similar with respect to actual stimuli).
Findings: Mediation has been found in discrimination learning of young children. Extent and perhaps even occurrence of mediation has been found to be governed more by external stimulus conditions than by developmental factors.
Duration: October 1964-September 1967.
Investigator(s): Peter D. Eimas, Ph.D., Assistant Professor of Psychology, Williams College, Williamstown, Mass.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Journal of Experimental Child Psychology, in press; additional articles are planned to be submitted to same journal.

20-CG-3 PAIRED-ASSOCIATES LEARNING IN CHILDREN

Purpose: To explore parameters of paired-associates learning; to develop word association norms for consonant-vowel-consonant (CVC) stimulus words; and to develop word-association norms for primaries elicited by CVC's.
Subjects: Fourth, sixth, and eighth grade boys and girls: approximate ages 9 to 10, 11 to 12, and 13 to 14.
Methods: Anticipation procedure used on paired-associates list, variables explored being patterns of pairings, exposure times, length of list, initial associative strength between words, grade level, and sex. Multiple word associations were taken to develop indexes of meaningfulness as well as associative strength.
Findings: Significant effects found for length of list, initial associative strength, exposure times.
Duration: September 1964-September 1966.
Investigator(s): Sydelle Stone Shapiro, Ph.D., Research Associate, Austen

Riggs Center, Stockbridge, Mass.
Cooperating group(s): Elementary schools of Dalton, and Pittsfield, Mass.; National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Results in Technical Reports 1-4 available from author. Also published in *Psychonomic Science*; *Child Development*, June 1966.

20-CG-4 LANGUAGE HABITS IN SERIAL VERBAL LEARNING

Purpose: To investigate effects of serial position within a list upon relative ease of memorizing a list of words, with variation in degree to which the list approximates a sentence. Also of interest are any differences in ease of learning different parts of speech.
Subjects: 54 subjects each from fourth, seventh, and tenth grades and college.
Methods: Learning by method of serial anticipation; 15-word lists of three levels of approximation to sentence word-order; presentation of material at a two-second rate to a learning criterion of one perfect anticipation of the list.
Duration: June 1965-May 1966.
Investigator(s): William E. Simpson, Ph.D., Assistant Professor of Psychology, Albion College, Albion, Mich.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Publication planned for *Journal of Verbal Learning and Verbal Behavior*.

20-CG-5 THE RELATIONSHIP BETWEEN MANIFEST RIGIDITY AND LANGUAGE LEARNING UNDER TWO DIFFERENT SYNTACTIC RULE SYSTEMS

Purpose: To discover possible relationship between two structural systems, cognitive organization (manifest rigidity) and linguistic structure (syntactic rules).
Subjects: 68 high school senior girls.
Methods: Subjects were divided into high and low rigidity according to test results (Braen's Manifest Rigidity Inventory). The two groups were subdivided and randomly assigned to two groups which were required to do syntactic exercises (substitutional and transformational rules were employed). Experimental language used was Swahili. Experimental design was based on a complete analysis of variance, 2 x 2 factorial.
Findings: No statistical significance was reflected in differences between manifest rigidity and rule-learning behavior even though F approached significance in a positive direction. Significant trends were revealed when specific syntactic rules were analyzed, especially with reverse order and compound rules, pointing the way to further research endeavors in this field.
Duration: September 1963-August 1964.
Investigator(s): Rudolph F. Wagner, M.A., Chief Psychologist, Richmond Public Schools, Administration Building, 809 E. Marshall St., Richmond, Va. 23219; and James N. Mosel, M.A., Professor of Psychology, George Washington University, Washington, D. C.
Publication: Mimeographed report.

20-CG-6 NEUROLOGICAL FINDINGS AND SPECIFIC LEARNING DEFICITS IN PRESCHOOL CHILDREN

Purpose: To test the hypothesis that a carefully defined pediatric neurological examination of the preschool age group may correlate better with psychological examinations and that the presence of minor neurological abnormalities may correlate with specific learning deficits.
Subjects: 40 to 60 underprivileged children aged three to five years.
Methods: Coordinated medical, psychological, and educational evaluations. Based on both the absolute level of accomplishment and the measure of improvement, re-examination at end of experience is used to help determine whether neurological examination in preschool period is stable and reproducible and whether this examination correlates with psychological and educational measures.
Investigator(s): Patricia A. O'Connor, M.D., Assistant Professor of Maternal and Child Health, School of Public Health, and Assistant Professor of Pediatrics and Communicable Diseases, Medical School; Ralph M. Gibson, Ph.D., Assistant Professor of Psychology, Medical School; and M. Jane Schwertfeger, Assistant Professor of Education, School of Education, University of Michigan, Ann Arbor, Mich. 48104.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

20-CG-7 SOCIAL-CLASS AND DEVELOPMENTAL DIFFERENCES IN THE ROLE OF LINGUISTIC STRUCTURES IN LEARNING

Purpose: To isolate sources of sentence facilitation of paired-associate learning in children; to assess relative magnitude of facilitation produced by verbal and pictorial conditions as a function of age and social class.
Subjects: More than 1000 kindergarten, first, third, and sixth grade pupils in lower class and middle class schools.
Methods: Paired-associates are presented by means of transparent slides in the case of verbal items and by means of movie film in the case of pictorial items by study-test methods.
Duration: August 1965-August 1967.
Investigator(s): William D. Rohwer, Jr., Ph.D., Assistant Professor of Education, 4313 Tolman Hall, University of California, Berkeley, Calif. 94720.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: To be submitted to appropriate journals.

20-CG-8 VERBAL MEDIATION IN CHILDREN'S RECALL

Purpose: To investigate developmental acquisition of a verbal-rehearsal strategy for memorizing items in a nonverbal, delayed serial recall task; to study the nature and utility of this strategy.
Subjects: Approximately 100 first-grade boys and girls.
Methods: Familiar objects are depicted on a screen and child is obliged to remember them in particular sequences. An observer lip-reads any detectable rehearsal of object names during a delay period prior to recall test. In a subsequent session, non-rehearsers are induced to rehearse via instructions.
Findings: Rehearsers recall better than non-rehearsers; non-rehearsers improve their recall if induced to rehearse, but nonetheless do not necessarily continue to rehearse when subsequently given option of abandon-

ing strategy.
Duration: October 1965-June 1966.
Investigator(s): John H. Flavell, Ph.D., Professor, Institute of Child Development, University of Minnesota, Minneapolis, Minn. 55455.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Child Development 37:2:283-299, June 1966.

20-CG-9 CONCEPT LEARNING AND RETENTION IN A SIMULATED CLASSROOM SITUATION

Purpose: To test assumption that children learn effectively through observation, and to learn how much is learned and retained by children who do not actively participate but merely observe learning of another child.
Subjects: Five groups each of third grade boys and girls selected from each of three I.Q. levels (high, medium, and low).
Methods: Each experimental group is composed of three subjects, one of whom learns a concept from an electronic teaching device while other two observe. One of two observing children is then tested on same apparatus under same procedure to obtain comparative estimates of amount learned through observation. Each of three subjects is returned individually to experimental setting 24 hours later to obtain comparative estimates of amount retained by means of a relearning procedure.
Duration: September 1964-October 1965.
Investigator(s): Ira J. Semler, Ph.D., Director of Research, Cedar Rapids Community School District, 346 2nd Ave., S.W., Cedar Rapids, Iowa.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-CG-10 CONDITIONAL DISCRIMINATION IN CHILDREN

Purpose: To investigate learning of conditional discriminations, transfer of conditional discrimination learning, and retention of conditional discriminations over time in children beginning at age three.
Methods: Major training techniques involve use of two-component training and several forms of conditional training. Transfer is investigated as well as effects of junk (everyday objects) cues and color and form patterns.
Investigator(s): Eugene S. Gollin, Ph.D., Chairman, Department of Psychology, Fels Research Institute, Antioch College, Yellow Springs, Ohio.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-CG-11 VERBAL MEDIATION IN CHILDREN'S BEHAVIOR

Purpose: To investigate joint effects of two experimental variables, degree of verbal response similarity and level of verbal pretraining, on performance in a motor paired-associate learning task.
Subjects: Children in kindergarten, elementary, and junior high school.
Methods: In four similar experiments, subjects learn names for visual stimuli, and either concurrently or subsequently, are required to learn button-pushing responses for the same stimuli.

Duration: January 1965-December 1966.
Investigator(s): Joan H. Cantor, Ph.D., Assistant Professor of Child Psychology, Institute of Child Behavior and Development, State University of Iowa, Iowa City, Iowa 52240.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-CG-12 VICARIOUS ASSOCIATIVE LEARNING IN CHILDREN

Purpose: To investigate vicarious associative learning in fourth, fifth, and sixth grade children using verbal materials; and to investigate effects of length of training, presence or absence of external reinforcement, commonality of stimulus words, and peer status of vicar.
Methods: Subjects listen to one of their peers performing a paired-associate task or responding with associates to stimulus words, originality of these associates being an independent variable. Effects of vicarious experience are assessed in direct transfer, mediational, and associative interference situations. Three children's personality inventories, comprising a locus of control scale, a social desirability scale, and an intellectual achievement scale, are used to assess extent to which personality variables are of import in vicarious originality training.
Duration: 1964-1966.
Investigator(s): Seymore Simon, Ph.D., Associate Professor of Psychology, and Raymond Ditrichs, Ph.D., Assistant Professor of Psychology, Northern Illinois University, DeKalb, Ill. 60115.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-CJ-1 AGE AND PATHOLOGY DIFFERENCES IN BENDER-GESTALT PERFORMANCE

Purpose: To compare Bender-Gestalt protocols of normal children, brain-damaged adults, and schizophrenic adults.
Subjects: 45 public school children, 39 brain-damaged adults, and 38 schizophrenic adults.
Methods: Bender-Gestalt protocols were analyzed by eight scales and two indices. Two general types of errors in Bender-Gestalt functioning were looked for: developmental and motivational errors.
Findings: Bender-Gestalt performances of children and brain-damaged adults were highly similar to each other, but unlike those of schizophrenic adults; children and brain-damaged adults made developmental errors, while the schizophrenics did not; schizophrenics did not make many errors of any kind.
Duration: July 1963-September 1965.
Investigator(s): Daniel Wile, Ph.D., Cowell Hospital, Berkeley, Calif. (Reported by Donald A. Shaskan, M.D., Chief, Mental Hygiene Clinic, Veterans Administration Hospital, 49 4th St., San Francisco, Calif.)
Cooperating group(s): Charles C. Havens Elementary School, Piedmont, Calif.; three Veterans Administration installations: San Francisco Mental Hygiene Clinic; Martinez Hospital; and San Francisco Hospital.
Publication: Doctoral thesis, University of California, Berkeley.

20-CJ-2 PSYCHOLOGICAL ASSESSMENT OF THE PRESCHOOL CHILD

Purpose: To examine clinical usefulness of new psychological instrument for assessing intellectual function.
Subjects: Children from following groups: severely retarded; organically impaired; deaf, mute, or bedridden; and culturally deprived.
Methods: The test is based on informational analysis of perceptual discrimination tasks and consists of form matching tasks made up of randomly generated forms of known information content. Subjects are to be followed for a five-year period to measure deterioration and validation by comparison with actual school performance and teacher ratings.
Findings: Test was found to be correlated with such tests of intelligence as the Peabody Picture Vocabulary Test and the Draw-a-Person; it was simple and rapid in administration; lower level simple enough for very young or very retarded; response required a simple motor act that can be performed by physically handicapped children.
Investigator(s): Leon A. Rosenberg, Ph.D., Instructor of Pediatrics and Medical Psychology, School of Medicine, Johns Hopkins University, Baltimore, Md. 21205.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

20-CJ-3 LONGITUDINAL CHANGES IN I.Q. BETWEEN GRADES THREE AND 11

Purpose: To investigate deviations in I.Q. scores which occur between grades three and 11.
Subjects: Original study (Bulletin 18, Research Relating to Children) contained 156 boys and 158 girls in public elementary schools. Eleventh grade sample to be collected in fall 1966 will be the survivors of original group.
Methods: Subjects were initially tested in third grade using the California short form Test of Mental Maturity, '50S Form. They were subsequently tested at two-year intervals as fifth and seventh grade pupils. Difference scores, both group and individual, were reported in addition to an analysis of variance and standard error of measurement of differences. Present study is a follow-up study and will add data from grade 11.
Duration: September 1958-July 1967.
Investigator(s): Carmen J. Finley, Ph.D., Director, Research and Data Processing; Jack M. Thompson, M.A., Director of Guidance; Albert Cognata, M.A., Guidance Consultant; and Lee Panttaja, M.A., Assistant Director, Research and Data Processing, Sonoma County Schools, 2555 Mendocino Ave., Santa Rosa, Calif.
Publication: To be submitted for publication when complete.

20-CJ-4 A CROSS-CULTURAL INVESTIGATION OF INTELLIGENCE TESTING

Purpose: To investigate relative usefulness of two intelligence tests in appraising intellectual status of children who have had little experience with tests; and to examine problems of testing children who are culturally very different from the test standardization groups.
Subjects: Ladino and Quiche Indian children in Guatemala highlands schools.
Methods: The Draw-a-Man Test and Raven Progressive Matrices were administered to children in two Guatemala schools; teacher ratings of intellectual abilities of pupils were obtained; and an analysis will be made of subjects' approach to test problems.

Duration: June-December 1965.

Investigator(s): Dale L. Johnson, Ph.D., Associate Professor, University of Houston; Douglass Price-Williams, Ph.D., Associate Professor; and Carmen A. Johnson, Ph.D. Candidate, Rice University, Houston, Tex.

Publication: Publication is planned within the next few months.

20-CJ-5 PIAGET'S TASKS: PERFORMANCE IN THE LIGHT OF CULTURAL EFFECTS AND INTELLIGENCE TEST SCORES

Purpose: To analyze what is required on Piaget's tasks, especially conservation tasks, which are coming to be widely used in research on development of reasoning; to follow up results obtained with these tasks with a sample of Chinese children in Hong Kong.

Subjects: 160 white American boys, 8 and 11 years old, with intelligence test scores ranging from 68 to 168 (California Test of Mental Maturity).

Methods: Subjects were in four groups: 8-year old, superior; 11-year old, dull; 11-year old, average; and 11-year old, superior. This arrangement allows a comparison of effects of M.A. and C.A. Tasks were of two types: conservation tasks, stemming from Piaget's stage of concrete operations, and a combinatorial task, from the stage of formal operations. In the Hong Kong study, these two types of tasks had been differentially linked with variations in schooling and intelligence test scores.

Findings: A lack of major difference between the two types of tasks in this sample of children. All tasks were equally linked to intelligence test scores, with correlations in the order of .4 and .5. Mental age overrides C.A., with no significant differences between dull 11-year olds and bright 8-year olds, matched by pairs for mental age. The results suggest an interaction between type of task and lack of schooling, with conservation tasks less affected by illiteracy.

Duration: August 1962-August 1965.

Investigator(s): Jacqueline Jarrett Goodnow, Ph.D., Assistant Research Professor, Department of Psychology, George Washington University, Washington, D. C. 20006.

Cooperating group(s): Montgomery County, Maryland School System; National Institute of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

Publication: Probably in Child Development.

20-CJ-6 IS INTELLIGENCE TESTING ENOUGH?

Purpose: To determine capacities in children beyond findings of intelligence tests.

Subjects: Sixth grade students in a private school.

Methods: Techniques for exploring unusual traits.

Duration: October 1965-June 1966.

Investigator(s): Elizabeth M. Junken, Ph.D., Director, Morrow Educational Center, Elisabeth Morrow School, 480 Next Day Hill Dr., Englewood, N. J.

20-CM-1 CONCEPT IDENTIFICATION OF AUDITORY DIMENSIONS AS A FUNCTION OF AGE AND SEX

Purpose: To focus on saliency of five different auditory dimensions in an attempt to examine the function of subject's sex and age in auditory Concept Identification.

Subjects: 200 male and female volunteer students between the ages of six and 18 years who performed on an auditory Concept Identification task.
Methods: Stimuli were presented through earphones worn by subject who sat in front of a panel with two response buttons with feedback light directly above each button. Subjects were told to place each stimulus into one of two categories by depressing a response button and that feedback lights would indicate correct response. The bileveled dimensions varied in the following manner: number, intensity, laterality, frequency, and duration.
Findings: Intensity was the most difficult dimension. Performance improved with age, although subjects in the 12-13-14 year old group in intensity condition made greater number of errors than both the younger and older groups. Males performed at significantly higher rate, with no difference in errors between the sex groups. Explanation of decrement in performance by the adolescent subjects was attempted.
Duration: March 1964-May 1966.
Investigator(s): Vladimir Pishkin, Ph.D., Chief Research Psychologist, Veterans Administration Hospital, 921 N. E. 13th St., Oklahoma City, Okla. 73104.
Publication: Plan to publish in *Journal of Experimental Psychology*.

20-CM-2 FACTORS IN YOUNG CHILDREN'S CONCEPT DEVELOPMENT

Purpose: To study factors governing acquisition of elementary concepts in young children, particular attention being given to influence of attendance in kindergarten in combination with nature of children's play activities at home and certain aspects of home environment that might be relevant to development of basic cognitive skills; also to examine relationship between this development and specific aspects of child's use of language.
Subjects: Children of kindergarten age, divided into a group attending kindergarten and a group not attending.
Methods: Changes in subjects' cognitive skills from pre- to post-test compared in both groups; changes found in both groups are further related to information on children's home experience and, for a subset of children, to performance on selected tasks and responses to questions administered at two or three times during period between pre- and post-test.
Duration: July 1965-December 1966.
Investigator(s): Joachim F. Wohlwill, Ph.D., Associate Professor of Psychology, Clark University, Worcester, Mass. 91610.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-CM-3 THE ROLE OF VARIOUS RESPONSE SYSTEMS IN CONCEPTUAL MEDIATION

Purpose: To study response systems underlying abstraction and conceptual transfer, specifically, role of verbal as well as nonverbal "coding" responses in mediating equivalence, and facilitating transfer, between physically dissimilar stimuli.
Subjects: Preschool children.
Methods: Subjects are screened by special techniques for possession or nonpossession of middle-size concept, and are also assessed for general verbal-conceptual level. Matched subgroups of "no-concept" children are then subjected to various training procedures, differing in terms of instructional method and/or type of response "built-into" child to mediate middle-size concept. Subject's ability to transfer between diverse instances of middle-sizedness is then tested.

Duration: 1962-continuing.
Investigator(s): Albert J. Caron, Ph.D., Section on Personality, Laboratory of Psychology, National Institutue of Mental Health, Bethesda, Md. 20014.

20-CP-1 A STUDY OF THE ABILITY OF EIGHTH GRADE STUDENTS TO UTILIZE TWO DIMENSIONS OF THE GUILFORD STRUCTURE OF INTELLECT MODEL IN ORGANIZING INFORMATION THEY POSSESS

Purpose: To study performance of eighth grade pupils in divergent production of units and classes, convergent production, memory, cognition and evaluation of classes, and convergent production of units as these intellectual productions may be expected to occur in regular classroom instruction.
Subjects: 50 pupils in two classes at Nicholas Junior High School, Fullerton, Calif.
Methods: Measurement instruments were constructed using words and concepts elicited from subjects. Guilford's definitions of the "Operations" were used in designing instruments. Data were gathered in five testing sessions. In four sessions pencil and paper instruments were used. In the fifth session, all subjects were interviewed by college students.
Duration: February 1966-February 1967.
Investigator(s): Ida S. Coppolino, Ed.D., Professor of Education, California State College at Fullerton, Fullerton, Calif.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Findings will be submitted for publication in journals related to the psychology of learning and teaching.

20-CP-2 UTILIZATION OF AN INTRINSIC PROGRAM TO STUDY THE PROBLEM-SOLVING PROCESSES OF GIFTED AND AVERAGE HIGH SCHOOL PUPILS

Purpose: To utilize an intrinsic program to study differences between gifted and average high school pupils in their problem-solving processes as well as in their products as determined by gain scores.
Subjects: 60 gifted and average eleventh and twelfth grade pupils identified by means of the School and Ability Test and the Iowa Test of Educational Development. The two groups are selected by matching pairs on the basis of criterion test scores.
Methods: Experimental segment of the intrinsic program is concerned with locating periodicals in the University library. Cards are processed by each subject to collect data. t tests for correlated samples and Chi-square are used to test the hypotheses.
Duration: August 1965-July 1967.
Investigator(s): John P. Casey, Ed.D., Assistant Professor of Education, Southern Illinois University, Carbondale, Ill.
Cooperating group(s): Program Development for Gifted Children, State of Illinois.
Publication: A preliminary report on information processing theory in connection with intrinsic programming. Final reports will be given to the Office of the Superintendent of Public Instruction, State of Illinois, and Southern Illinois University.

20-CP-3 ERRORS AND DISCRIMINATION PERFORMANCE IN CHILDREN

Purpose: To investigate in young children effect on terminal accuracy of discrimination performance and on emotional behavior of different procedures designed to produce a difference in frequency of errors.
Methods: A free-operant discrimination procedure is used. With one group, many errors are expected; with another group, few errors. Differences between groups with respect to mean number of errors during two experimental sessions, mean number of errors during latter part of second session, and mean number of emotional behaviors (defined through use of checklist) during second session are all tested for significance through t tests.
Duration: February 1965-September 1966.
Investigator(s): Lawson H. Hughes, Ph.D., Assistant Professor and Research Associate, School of Education and Audio-Visual Center, Indiana University, Bloomington, Ind.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-CP-4 THE ANALYSIS AND SYNTHESIS OF PROBLEM-SOLVING BEHAVIOR

Purpose: To develop techniques for teaching children complex problem-solving skills.
Subjects: Four- to nine-year-olds.
Methods: Experimental.
Findings: Children can acquire skills beyond what could be predicted from developmental theory.
Duration: 1962-1968.
Investigator(s): Richard C. Anderson, Ed.D., Associate Professor, University of Illinois, Training Research Laboratory, 8 Lincoln Hall, Urbana, Ill.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: University of Illinois Training Research Laboratory Monographs 1:3-7; book in press.

Personality

20-DA-1 DISCRIMINATION BETWEEN DICHOTOMOUS PERSONALITY GROUPS AS DETERMINED BY HUMOR PREFERENCES

Purpose: To construct a humor preference inventory which will elicit humor judgments from selected subjects, and to employ this inventory in determining effectiveness of humor stimuli in discriminating between dichotomous groups of high school students.
Subjects: Two groups of students chosen by their teachers to fit prepared behavioral descriptions of conformist and nonconformist personality.
Methods: Humor preference inventory is first constructed, each item having demonstrated its discriminative effectiveness in several pretesting procedures. Each subject of two groups then responds to it by indicating which of two cartoons in each item he believes to be funnier. Appropriate statistical analyses are then employed to determine degree of difference between two groups' responses. Reliability of the subjects' humor preferences is then calculated.
Duration: July 1964-September 1965.

Investigator(s): Stanley L. Wenck, (Doctoral candidate, University of South Dakota), Department of Psychology, Ball State University, Muncie, Ind.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-DA-2 A STUDY OF SOME OF THE WAYS IN WHICH REJECTED CHILDREN BEHAVE

Purpose: To study behavior of rejected children; to determine effect of personal rejection in eliciting conformity; specifically, to determine whether heightened susceptibility to influence is limited to rejector-rejectee relationship or whether it extends to relationships with other (unfamiliar) persons as well; to gather data bearing on "personality" consequences of rejection (e.g., lowered self-esteem and motivation to ingratiate oneself).
Subjects: 72 male students randomly assigned to conditions in a 2 X 2 X 2 factorial design.
Methods: Each subject is given a certain experience -- either acceptance or rejection. He is then paired with a peer for a conformity task - either with same person or someone else. Judgments are given either publicly or privately. Three variables thus manipulated are experience of subject prior to taking part in conformity task, familiarity of peer judge, and publicity attending giving of judgments.
Duration: July 1965-June 1966.
Investigator(s): Joel M. Savell, M.A., Assistant Professor of Psychology, Alfred University, Alfred, N. Y. 14802.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-DD-1 DETERMINANTS AND CORRELATES OF DREAM CONTENT

Purpose: To gather the first set of normative data on childhood dream content obtained with electrophysiological techniques of dream detection; to assess the effects of an experimentally controlled presleep manipulation (violent vs. nonviolent film) upon such content; and to assess intellective and personality correlates of such content.
Subjects: 32 boys, ages 6 to 8 and 10 to 12.
Methods: Subjects slept two nights in the laboratory, with four REM-sleep-content-retrieval awakenings scheduled for each night.
Findings: Presleep viewing of a violent film reduced dream intensity in general and dream hostility in particular.
Duration: April 1965-April 1966.
Investigator(s): David Foulkes, Ph.D., Assistant Professor of Psychology, University of Wyoming, Box 3371, University Station, Laramie, Wyo. (Reported by R. H. Denniston, Ph.D., Director of Research Development, University of Wyoming.)
Cooperating group(s): National Science Foundation.
Publication: Report available on request to investigator.

20-DD-2 GENERATIONAL CHANGE: A STUDY OF CONFLICT, DIFFERENCE, AND CHANGE BETWEEN PARENTS', TEACHERS', AND HIGH SCHOOL STUDENTS' VALUES

Purpose: To determine in what areas adolescent rebellion does and does not occur, and the extent to which parents' and high school teachers' values are mutually supportive.

Subjects: Entire ninth and eleventh grades of one large city working class high school, their parents and teachers.

Methods: All three groups of subjects respond to a standardized instrument for measuring their values as selected from literature concerning adolescent subcultures (e.g., college and high school education, dating and marriage, automobiles, fighting, etc.) and organized around the constructed typology of deferred gratification pattern. These values are then measured by means of semantic differential. Analysis of means and standard deviations permits specification of differences and homogeneity of values in subcultures, such as male/female, grade levels in school, social class levels, etc.

Duration: Not reported-December 1966.

Investigator(s): Edward Z. Dager, Ph.D., Professor of Sociology, Purdue University, Lafayette, Ind.; and Glenn A. Harper, M.S., Professor of Sociology, University of Maryland, College Park, Md.

Cooperating group(s): Purdue Research Foundation.

20-DD-3 EFFECT OF EMOTIONAL CLIMATE OF THE HOME ON PERSONALITY DEVELOPMENT

Purpose: To determine interrelationships among parent personality characteristics and attitudes, and social climate of home, and influence of these factors on personality, social maturity, and intelligence of child.

Methods: Use of following instruments: Minnesota Multiphasic Personality Inventory, Parent Attitude Inventory, Parental Attitude Scale, Parent-Parent-Child Adjustment, Measure of Child Personality, Personality Rating, Stanford-Binet Intelligence Scale, and Vineland Social Maturity Scale.

Duration: 1963-not reported.

Investigator(s): Beverly D. Fowler, Ph.D., Associate Professor of Human Development and the Family, and Associate Director, School of Home Economics, University of Nebraska, Agricultural Experiment Station, Lincoln, Nebr.

Cooperating group(s): Cooperative State Experiment Station Service, U. S. Department of Agriculture.

20-DD-4 DEVELOPMENT OF CHANGES IN MODES OF EXPRESSING MOTIVES

Purpose: To develop methods for obtaining samples of expressions of motives (and criterion for inferring the developmental status of these motives from behaviors exhibited) with respect to three types of expressions: (1) motives expressed in physical activity (action-motoric); (2) motives expressed in fantasy and imaginal activity (fantasy); and motives represented abstractly and communicated verbally (verbal-representational). To study normal and deviant personality development in terms of certain expectations concerning development within and between modes of expressing motives.

Subjects: Hypoactive, hyperactive, and normal-active children at different ages.

Methods: For action-motoric expressions, the Miniature Situations Test; for fantasy expressions, the Structured Fantasy Test; for verbal-representational expressions, the Continuous Word Association Test and Structured Sentence Completion Test. General procedure involves eliciting these motive expressions in subjects ordered developmentally (e.g., young children vs. older children) and with respect to psychopathology representing deviations of modalities of motive expressions (e.g., hyperactive vs. hypoactive) and assessing these expressions according to three interdependent criteria, which have meaning developmentally: directness; control and delay; and social appropriateness.

Findings: Preliminary findings suggest support for some main hypotheses: action expressions characterize subjects with developmentally low standing, while fantasy and verbal-representational behavior characterizes more advanced subjects; also, there is a vicarious relationship among the three modalities.

BEST COPY AVAILABLE

Duration: March 1965-June 1967.
Investigator(s): Sebastiano Santostefano, Ph.D., Director of Research, Worcester Youth Guidance Center, 275 Belmont St., Worcester, Mass. 01604.
Cooperating group(s): Clark University.
Publication: Findings to be published.

20-DD-5 SELF-CONTROL IN CHILDREN

Purpose: To study change in self-control as function of chronological age; to investigate certain major variables--sex, parental attitudes, and types of settings--previously suggested as major correlates of this development.
Subjects: 120 children between the ages of six and eight years, divided successively into age brackets of six months each with 15 boys and 15 girls in each bracket.
Methods: Recording of actual or reported behavior under four conditions: an isolated temptation situation, classroom situation, in presence of mother and two other adults, and mother's report of child's behavior; analysis of data according to age and sex of subjects and investigation made of similarities or differences found in various settings.
Investigator(s): Richard P. Walsh, Ph.D., Assistant Professor of Psychology, Southern Illinois University, Edwardsville, Ill. 62025.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-DD-6 NATIONAL SURVEY OF YOUTH

Purpose: To question representative samples of American youth periodically on issues germane to personality development in American society.
Subjects: A representative sample of boys and girls aged 13 to 16, residing in the contiguous states.
Methods: Survey interviews and tabulation of records kept by youth-serving and other agencies.
Duration: January 1966-December 1968.
Investigator(s): Martin Gold, Ph.D., Assistant Program Director, Research Center for Group Dynamics, Institute for Social Research, University of Michigan, Ann Arbor, Mich.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Articles and monographs planned.

20-DG-1 THE INFLUENCE OF AGE AND INCENTIVES ON CHILDREN'S SELF-REWARD

Purpose: To investigate the effects of age, incentives, and class standing on frequency of self-reinforcement in children.
Subjects: In two experiments 543 children from second to eighth grade.
Methods: In experiment I, children in classes rewarded themselves for anticipating an E response correctly, when chances for successful guessing were near zero. Groups differed in rewards for "correct" guesses, yielding either points or candy. A third group first observed a model obtaining candy. In experiment II, self-reinforcement was taken by the child for correctly responding after a simple, partially learned visual discrimination task in individual sessions.
Findings: Younger children gave more inappropriate self-rewards, as did children who were rewarded with candy and those who observed a model's self-rewards. Children who were ranked in the lower half of their classes exceeded high ranking subjects in self-rewards in the candy and model groups. In experiment II, low ranking subjects performed equally well with high ranking

subjects, but took more undeserved self-rewards. Incorrect self-reinforcement correlated 0.45 in subjects who participated in both experiments.
Duration: Summer 1965-spring 1966.
Investigator(s): Frederick H. Kanfer, Ph.D., Professor of Medical Psychology, Medical School, University of Oregon, Portland, Oreg. 97201.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Submitted for publication to *Psychological Reports*.

20-DJ-1 VALUES, STATUS, AND LEISURE TIME ACTIVITIES: A STUDY IN THE SOCIOLOGY OF ADOLESCENCE

Purpose: To study the relationship of values to leisure time activities in the adolescent subculture.
Subjects: All high school males in grades 10, 11, and 12 (ages 14 to 18) in two southern Indiana small towns.
Methods: Certain values were explored that have a specific effect on adolescent leisure time behavior, and others were delineated that have no effect on leisure time patterns. Values were measured according to the newest form of the Levy Modification of Allport-Vernon-Lindzey *Study of Values*. Status was investigated as a possible intervening variable using A. B. Hollingshead's *Two Factor Index of Social Position*. Leisure was studied through a specially constructed leisure time activities questionnaire.
Investigator(s): Patrick J. Hunter, S.J., Bellarmine School of Theology, Loyola University, 230 S. Lincoln Way, North Aurora, Ill. 60542.
Cooperating group(s): Society of Jesus, Ponchatoula, La. 70454.

Social

20-EA-1 PEER REINFORCEMENT: EMPIRICAL STUDIES

Purpose: To study the incidence of positive reinforcement occurring in child-child interactions in the nursery school; to examine these phenomena in relation to situational factors eliciting them, and their consequences; to study effects of reinforcement occurring in child-child dyads on social influences of a variety of kinds as measured in the laboratory.
Subjects: 85 three- to six-year olds enrolled in nursery school.
Methods: Observational techniques involving time-sampling and a variety of laboratory methods.
Findings: Individual differences in peer reinforcement are relatively stable; amount increases generally with age; amount of positive reinforcement is positively correlated with social acceptance; social acceptance is negatively related to performance-effects of a child's reinforcement in simple ambiguous tasks but status-competence of a reinforcing peer is positively related to his effectiveness as a reinforcing agent.
Duration: January 1965-indefinite.
Investigator(s): Willard W. Hartup, Ed.D., Professor of Child Psychology, Institute of Child Development, University of Minnesota, Minneapolis, Minn. 55455
Publication: *Journal of Experimental Child Psychology* 2:306-315, 1965; *Young Children* 20:176-184, 1965.

20-EA-2 ADULT SOCIAL FUNCTIONING RELATED TO CHILD DEVELOPMENT

Purpose: To learn whether patterns of social functioning attained in adulthood may be predicted from childhood behavior.

BEST COPY AVAILABLE

Subjects: 134 individuals enrolled in the Longitudinal Study of Child Health and Development conducted by Dr. Harold C. Stuart at the Harvard School of Public Health. Subjects were followed periodically from birth to 18 years and are now between 25 and 34 years old.
Methods: Identification of consistencies and inconsistencies in behavior described in individual patterns of social functioning during adulthood in relation to those previously described during the postpubescence and the preschool periods; relating patterns of social functioning with patterns of physical changes.
Duration: January 1965-December 1968.
Investigator(s): Isabelle Valadian, M.D., Associate Professor of Maternal and Child Health; Ruth M. Butler, M.S., Research Associate in Social Work; and Robert B. Reed, Ph.D., Professor of Biostatistics, School of Public Health, Harvard University, 55 Shattuck St., Boston, Mass. 02115.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Publications planned in 1968.

20-EA-3 A COMPARATIVE ANALYSIS OF TEENAGERS' PROBLEMS AND ADJUSTMENT PATTERNS, 1942-46 AND 1962-66

Purpose: To determine differences between problems and adjustment patterns and associational processes of high school students in comparable communities over a period of two decades. Some reference to regional differences, class differences, age and sex differences is indicated in the measurements.
Subjects: Roughly 1,500 boys and girls from three different comparable types of communities in the earlier sample from Georgia and Michigan and a similar sample from Florida and North Carolina for more recent sample.
Methods: Questionnaires were verified by interviews and group discussions, then coded and processed with data processing units for 1962-66 sample, and certain data compared with findings of crude percentages arrived at through hand tabulations from the 1942-46 sample.
Duration: 1962-1968.
Investigator(s): Melvin J. Williams, Ph.D., Chairman, Department of Sociology and Anthropology, East Carolina College, Greenville, N. C.
Publication: Roughly one-third of findings of earlier study have previously been published in Social Forces and in a Florida State University Monograph.

20-EA-4 AN EXPERIMENTAL ANALYSIS OF CHILD-CHILD INTERACTIONS

Purpose: To assess peer reinforcement influence on the free-field social behavior of preschool children.
Subjects: Kindergarten children in groups of three and groups of 10 to 15.
Methods: Naturalistic observation combined with experimental techniques. One child is observed with peers until stable picture is obtained of child's behavior and contingent behaviors of his peers. Then peers are instructed (through instructions and imitation sessions with experimenter) to ignore one of child's response classes. Observational methods then used to assess effect of experimental intervention.
Findings: Peers may function as powerful reinforcement agents for a number of typical child social behaviors.
Duration: June 1965-August 1966.
Investigator(s): Robert G. Wahler, Ph.D., Assistant Professor of Psychology, University of Tennessee, Knoxville, Tenn. 37916.

Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Intend to submit to *Journal of Experimental Child Psychology*.

20-EA-5 GROUP NORMS IN CLASSROOMS OF CONTRASTING SOCIO-ECONOMIC STATUS AND DIFFERING RACIAL COMPOSITION

Purpose: To discover correlates of popularity in classrooms of differing socio-economic level and racial compositions.
Subjects: Four groups of three sixth grade classrooms each providing subjects in four categories: Caucasian "core culture", Negro "core culture", Caucasian lower class, and Negro lower class.
Methods: Each subject completes a reputation test, measuring degree to which each child is seen by peers as having certain traits and characteristics. One item provides a measure of each child's popularity. By correlating children's scores on measured traits and characteristics with scores on popularity, it is possible to determine relationship of these traits and characteristics to popularity. Influence of sex on correlates of popularity is assessed by analyzing data separately for sex of children as raters and sex of children rated. Analysis of variance and factor analysis techniques are used to assess differences in correlates of popularity among combinations of race, socio-economic status, sex of raters, and sex of those being rated.
Duration: March-December 1964.
Investigator(s): Richard W. Brozovich, M.A., Department of Psychology, George Peabody College for Teachers, Nashville, Tenn. 37203.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-EA-6 SOCIAL REINFORCEMENT IN A NATURAL SETTING

Purpose: To test effects of adult social reinforcement on child behavior in a nursery school group.
Subjects: Four-year old child having difficulty in relations with peers and teachers.
Methods: Experimenter systematically applied positive reinforcements following acceptable social behavior and ignored unacceptable behavior. Data on peer reinforcements were also collected.
Findings: There was an increase in frequency of approved and a decrease in frequency of disapproved acts. High degree of agreement was reached between two sets of behavioral observations made, one by observers uninformed as to hypothesis, and other by informed observer. It was impossible to separate reinforcing and inhibiting properties of adult, and consequently, to interpret process by which behavior was modified.
Duration: Completed.
Investigator(s): Phyllis M. Scott, Ph.D., Visiting Fellow; Roger V. Burton, Ph.D., Research Psychologist; and Marian R. Yarrow, Chief, Section on Developmental Psychology, Laboratory of Socio-environmental Studies, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda, Md. 20014.

20-ED-1 PREMARITAL SEX ATTITUDES, VALUES, AND BEHAVIOR PATTERNS IN MINNESOTA

Purpose: To study attitudes, values, and behavior patterns in regard to premarital sex; to investigate weaknesses and strengths in communities of the state related to implementation of programs designed to reduce incidence of illegitimate births.
Methods: Field work involving visits to four communities in Minnesota to observe community life and to interview youth and adults; interviews with all unwed mothers coming to Lutheran Social Service of Minnesota during 1965; and analysis of dating histories of several hundred recent high school graduates.
Duration: June 1964-June 1966.
Investigator(s): Floyd M. Martinson, Ph.D., Professor of Sociology, Gustavus Adolphus College; and James K. Merrill, Director, Division of Child Welfare, Lutheran Social Service of Minnesota, St. Peter, Minn.

20-EG-1 A CROSS-CULTURAL STUDY OF SMOKING BEHAVIOR AND RELATED VARIABLES FOR STUDENTS ATTENDING EIGHT HIGH SCHOOLS IN ARIZONA

Purpose: To study inter-ethnic differences in factors (values, attitudes, parental and peer influences, etc.) related to development of smoking behavior among samples of high school youth in southern Arizona; to recommend specific changes or additions to existing programs of smoking education based upon findings.
Subjects: Approximately 8,000 high school students drawn from samples of "Anglo," Mexican-American and Indian groups in eight high schools in southern Arizona.
Methods: Questionnaire and interview data.
Duration: August 1964-August 1968.
Investigator(s): Salvatore V. Zagona, Ph.D., Associate Professor of Psychology, University of Arizona, Tucson, Ariz.
Cooperating group(s): National Clearinghouse for Smoking and Health, Division of Chronic Diseases, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Preliminary findings in Research Reports, Vol. III, National Research Conference on Smoking Behavior, University of Arizona, March 30-April 1, 1966. Copies available upon request. Formal journal publication of findings presently in preparation.

20-EG-2 EPIDEMIOLOGICAL STUDY OF THE USE OF BEVERAGE ALCOHOL AMONG DELINQUENT AND NONDELINQUENT ADOLESCENTS

Subjects: 500 delinquent and 3,400 nondelinquent male adolescents.
Methods: Collection of data on subjects and coding and punching on IBM cards; testing against both samples of a series of correlates wherein primary dependent variable is a newly developed typology.
Duration: January 1964-December 1967.
Investigator(s): Harold W. Demone, Jr., Ph.D., The Medical Foundation, Inc., 227 Commonwealth Ave., Boston, Mass.
Cooperating group(s): United Health Foundation, Inc.

20-EJ-1 SEX AND AGE SOCIAL SCHEME IN CHILDREN, ADULTS, AND SCHIZOPHRENICS

Purpose: To examine effects of an individual's own age and sex position on his use of age and sex dimensions in categorizing other people.
Subjects: Eight age-sex groups of three-year old males and females, five-year old males and females, nine-year old males and females, adult males and females, and 15 poor premorbid and 15 good premorbid schizophrenics from the Brockton Veterans Administration Hospital.
Methods: A booklet containing 20 sets of pictures will be administered to groups of subjects. Each page will contain pictures of four people who differ in terms of sex and age, e.g., man-boy vs. woman-girl. Subject's task is to group figures into two groups with two figures in a group by drawing lines between figures felt to belong together. Subjects may classify each page of figures in one of three ways: (1) an age categorization (e.g., boy-girl vs. man-woman), (2) a sex categorization (e.g., man-boy vs. woman-girl), and (3) a mixed categorization (e.g., man-girl vs. woman-boy). Short post-test questionnaire will be administered to determine subject's phenomenal basis of classification for each group of pictures.
Duration: March-September 1965.
Investigator(s): Harry L. Julia, M.A., Social Psychology Trainee, 141 Carlton St., Brookline, Mass. 02146.
Cooperating group(s): Veterans Administration.

Physical handicaps

20-FA-1 EPIDEMIOLOGY OF CONGENITAL DEFECTS IN A VERMONT COUNTY

Purpose: To study prevalence of congenital defects in a cohort of 1,813 live births in a Vermont County over a 12-year period; to determine pattern of defects, who discovered them, when and what methods of medical care were provided for them.
Subjects: Entire liveborn population of Chittenden County, Vermont during 1952.
Methods: Cohort analysis of population with family questionnaire, record tracing, hospital and crippled children's analysis, follow-up of state health department records, etc.
Duration: June 1964-June 1965.
Investigator(s): Roger J. Meyer, M.D., and Richard Wulf, M.D., Associate Professors, Pediatrics and Preventive Medicine, School of Medicine, University of Virginia, Charlottesville, Va.
Cooperating group(s): State of Vermont Health Department; University of Vermont.
Publication: New England Journal of Medicine, April 26, 1966.

20-FA-2 CHARACTERISTICS OF MULTIPLY IMPAIRED STUDENTS

Purpose: To ascertain the incidences and combinations of multiple handicaps in children with severe visual impairment under 21 years of age in the United States; to define further needs and areas of research as a result of these findings particularly in terms of future educational program planning, curricular methodology, and recommendations for teacher-training courses.
Subjects: Any child in the U. S. between the ages of 5 and 21 who has at

least one additional handicap besides blindness or severe visual impairment. Methods: A survey-questionnaire form was devised and sent to state departments of education, residential schools for the blind, special schools, institutions for the mentally retarded, local school districts, and public and private agencies.
Duration: November 1965-December 1966.
Investigator(s): Milton D. Graham, Ph.D., Director, American Foundation for the Blind, 15 W. 16th St., New York, N. Y. 10011.
Publication: A report of the survey findings will be made available.

20-FD-1 THE CLINICAL APPLICATION OF FILTERED ENVIRONMENTAL SOUNDS FOR THE ASSESSMENT OF HEARING IN CHILDREN

Purpose: To refine assessment of hearing in young children who are unable to conform to routine formalized hearing testing procedures.
Subjects: 20 normal hearing children and 20 children with high frequency hearing loss; two similar groups of adults.
Methods: Establish threshold of awareness for experimental sounds in each of the filtered bands and threshold for pure tones 500, 1,000 and 2,000 Hz; compare thresholds using statistical tests.
Findings: There appears to be close agreement between threshold of awareness for majority of filtered sounds and corresponding pure tone. Some sounds do not lend themselves to this procedure.
Duration: Fall 1964-January 1967.
Investigator(s): Earl Harford, Ph.D., Associate Professor of Audiology and Director, Hearing Clinics, and Anita Bellmann, M.A., Associate Director, Hearing Clinics, Northwestern University, Evanston, Ill. 60201.
Publication: To be submitted to Journal of Speech and Hearing Disorders.

20-FD-2 VOICE DISORDERS IN SCHOOL AGE CHILDREN

Purpose: To determine prevalence of voice disorders in children; to study methods of therapy.
Subjects: Children, aged five to 21 years, in public and private schools of Metropolitan St. Louis.
Methods: Survey for detection and complete evaluation of child--medical, psychological, and acoustic.
Duration: April 1966-April 1969.
Investigator(s): Frank B. Wilson, Ph.D., Director of Speech Pathology, Jewish Hospital of St. Louis, 216 S. Kingshighway, St. Louis 10, Mo.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-FD-3 DIAGNOSIS OF CEREBRAL DYSFUNCTION IN CHILDREN: A 10-YEAR FOLLOW-UP

Purpose: To provide adjustment data after 10 years on group of patients originally seen in a child guidance clinic; to see if adjustment after 10 years differs for the two groups of children in original study: a group with abnormal EEG's and consistent signs of brain dysfunction, and a group with normal EEG's and negative in tests for brain dysfunction.
Subjects: Follow-up of 108 young adults, male and female, now 17 to 25 years of age, from an original group of 150 patients seen in 1955-1957.
Methods: Evaluation of current adjustment based on questionnaire and

833

rating scale completed by parent(s) and rated by a psychiatrist and two psychologists as indicative of "average adjustment" or "poor adjustment", and the Minnesota Multiphasic Personality Inventory completed by each subject and results rated by three psychologists as indicative of "average adjustment" or "poor adjustment".
Findings: Slightly over half of subjects considered to be making an adequate adjustment; trend for children with cerebral dysfunction to have a higher proportion of maladjustment than those who showed little or no dysfunction and for those subjects originally rated as normal neurologically to have the most abnormal appearing MMPI profiles.
Duration: September 1964-February 1966.
Investigator(s): Leo J. Hanvik, Ph.D., Clinical Assistant Professor of Psychology, Medical School, University of Minnesota, 901 Utah Ave. S., and Child Clinical Psychologist, and Carol M. Kaste, B.A., Clinical Psychologist, Washburn Memorial Clinic, Minneapolis, Minn.
Publication: Presented at XVIIIth International Congress of Psychology.

20-FD-4 SURVEY OF NEUROLOGICAL AND PSYCHOLOGICAL FACTORS ASSOCIATED WITH RETROLENTAL FIBROPLASIA IN SCHOOL-AGE CHILDREN IN NORTH CAROLINA

Purpose: To survey children with retrolental fibroplasia in the Governor Morehead School (formerly State School for the Blind), Raleigh, N. C. If possible, survey will be extended to include children not enrolled in Governor Morehead School, but in the population of other state agencies, particularly schools for the retarded.
Subjects: 54 children in the residential school for the blind.
Methods: Each child is examined by a neurologist and EEG's are taken. When abnormalities are noted, re-examinations and additional EEG readings are made. A battery of psychological tests, including the six verbal subtests of the WISC, and a few selected items from the HAPTIC Intelligence Test for the Blind (not standardized for this age population but used to survey performance ability) is administered; measures of mannerisms, space orientation and mobility, fantasy life, and dreams are also taken. School grades and achievement tests scores are included.
Findings: Findings tend to substantiate several other surveys using EEG's on this population which revealed no significant or consistent patterns of neurological abnormalities in the group as a whole.
Duration: 1965-1967.
Investigator(s): George Paulson, M.D., Neurologist, North Carolina Department of Mental Health; and Rachel F. Rawls, M.S., Director of Research, The Governor Morehead School, Raleigh, N. C.
Cooperating group(s): Dorothea Dix Hospital; The State Commission for the Blind, Raleigh, N. C.
Publication: Article submitted to North Carolina Medical Journal.

20-FD-5 "MINIMAL CEREBRAL DYSFUNCTION SYNDROME": EVALUATION OF DIAGNOSTIC CRITERIA

Purpose: To evaluate significance of physiologically determined neurological deficits in certain behavioral manifestations, i.e., certain neurological signs, hyperactivity, and learning problems in children with minimal cerebral dysfunction.
Subjects: An experimental group of 25 children between five and nine years old, who have been referred to the Neurology Clinic because of learning or behavioral problems, and a control group of 25 normal children between ages of five and nine years, who have not been reported to have learning and behavioral problems.

Methods: Neurological examination, EEG, psychological and language testing (including the Bender Visual Motor Gestalt, The Illinois Test of Psycholinguistic Abilities, Templin Darley Test of Articulation, Peabody Vocabulary Test, Stanford-Binet Form L-M).
Findings: A specific type of EEG abnormality has been frequently found in patients with specific defects which would be basic to learning and behavioral problems.
Duration: January 1965-January 1966.
Investigator(s): Robert N. Pavy, M.D., Chief, and Jean Metcalfe, Ph.D., Speech Pathologist, Division of Neurology, San Mateo County General Hospital, 222 W. 39th Ave., San Mateo, Calif.
Cooperating group(s): Association of Neurologically Handicapped.

20-FD-6 MOTOR IMPAIRMENT IN SCHOOL CHILDREN

Purpose: To validate and standardize the Gollnitz revision of the Oseretsky Test of Motor Ability.
Subjects: Randomized samples of school children aged five to 15 years throughout Britain.
Methods: Regular procedures for item-improvement and validation, and test-standardization.
Duration: January 1965-September 1968.
Investigator(s): Denis H. Stott, Ph.D., Lecturer, Department of Psychology, University of Glasgow, Glasgow, W.2, Scotland.
Cooperating group(s): Spastics Society; Scottish School of Physical Education.
Publication: Publication planned in appropriate journals.

20-FD-7 AN INPUT-OUTPUT APPROACH TO PSYCHODIAGNOSIS IN CHILDREN

Purpose: To relate empirical findings with a theoretical model for psychodiagnosis in children.
Subjects: Over 200 children from pediatric and crippled children's services, and referrals from private practice.
Methods: Use of WISC ratios and ratios based on intertest comparisons, e.g., arithmetic on WISC and arithmetic on WRAT.
Findings: Significant differences in vocabulary input-output with borderline children.
Duration: September 1965-summer 1967.
Investigator(s): Luciano L'Abate, Ph.D., Professor of Psychology, Georgia State College, 33 Gilmer St. S.E., Atlanta, Ga. 30303.
Cooperating group(s): Child Development Laboratory and Institute for Psychological Services, Inc., Georgia State College.
Publication: Paper read at meeting of Southern Psychological Association, New Orleans, April 1, 1966.

20-FG-1 10-YEAR STUDY OF BRAIN-DAMAGED CHILDREN

Purpose: To study in a longitudinal fashion the emotional development of children who have been seen as patients in a community mental health center and whose condition was diagnosed as Chronic Brain syndrome.
Subjects: 13 children who were diagnosed as brain-damaged in 1955 following a study by psychologists, social workers, and psychiatrists in a

psychiatric out-patient clinic. Of the 40 children in the original study, 13 are currently available for restudy.
Methods: Intensive interview by a social worker with parents to determine current functioning; psychological testing and psychiatric and neurological examinations; electroencephalographic testing; data from examinations and interviews to be included in report along with analysis of these data.
Duration: June 1956-October 1966.
Investigator(s): Albert E. Rauh, M.D., Staff Psychiatrist; Milton C. Baumann, M.D., Medical Director; C. R. Dickson, M.A., Psychologist; Thomas C. Bergin, M.S.W., Psychiatric Social Worker; and Fred A. Ludwig, M.S.W., Psychiatric Social Worker and Executive Director, Mental Health Association, 1300 S. 7th St., Springfield, Ill. 62703.
Cooperating group(s): Springfield Chapter, American Business Club.
Publication: The report will be published privately and will be available for distribution at a small cost.

20-FG-2 THE EFFECTS OF SYMPTOM ON THE CHILD

Purpose: To examine, across clinical groups, differential effects of cleft palate, asthma, congenital and traumatic amputation, and obesity.
Subjects: 50 cleft lip, 50 cleft palate, 50 cleft lip and palate, 50 asthmatic, 50 traumatic amputees, 50 congenital amputees, and 50 obese children, all between ages 11 and 17.
Methods: Questionnaires and self-rating scales.
Duration: December 1965-June 1967.
Investigator(s): Edward Clifford, Ph.D., Assistant Professor of Medical Psychology, Medical Center, Duke University, Durham, N. C. 27706.
Cooperating group(s): National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Publication through available professional journals.

20-FG-3 A DEVELOPMENTAL STUDY OF CEREBRAL PALSIED INFANTS

Purpose: To assist in evaluation of an infant rehabilitation program.
Subjects: 50 children under two years of age in a rehabilitation program at the North Carolina Cerebral Palsy Hospital.
Methods: Subjects are examined on admission to program on the Vineland Social Maturity Scale and the Cattell Infant Intelligence Scale. They are re-examined at three-month intervals or longer, on the Cattell Infant Scale. Plans are made for re-evaluation of subjects on the Vineland Social Maturity Scale at yearly intervals.
Findings: Very little change in intelligence quotient has been noted during the past two years.
Duration: Fall 1963-1968.
Investigator(s): Katharine M. Banham, Ph.D., Associate Professor of Psychology, Duke University, Durham, N. C. 27706.
Cooperating group(s): Mary M. Huse, Ph.D., Psychologist, Department of Psychiatry, Duke University School of Medicine.

20-FG-4 THE ASSESSMENT OF THE WRITTEN LANGUAGE OF DEAF STUDENTS

Purpose: To describe the written language of deaf students, and to

establish a test instrument with national norms.
Subjects: 900 deaf subjects, ages 10 to 18 years, selected from national population by stratified random sampling procedures.
Methods: Multiple-regression equations were developed for each age, 10 to 18; six variables (grammatic correctness, composition length, sentence length, type-token ratio, utilization of parts of speech, spelling) served as predictors, and teacher judgment served as criterion.
Findings: Grammatic correctness, type-token ratio, and composition length share approximately 75 percent of variance of teacher judgment.
Duration: September 1964-May 1966.
Investigator(s): E. Ross Stuckless, Ph.D., Assistant Professor, University of Pittsburgh, Pittsburgh, Pa. 15213; and Claude Marks, Ed.D., Assistant Professor, University of Texas, Austin, Tex.
Cooperating group(s): 14 residential and day schools for the deaf; Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Report to be submitted to Office of Education.

20-FG-5 PSYCHOLINGUISTIC METHODS IN THE CLASSIFICATION OF APHASIA

Purpose: To ascertain changes that occur in linguistic structure with age and maturation; to provide a normative base of lexical frequency of use in relatively free speech for comparison with pathological groups such as children with delayed development of language--brain-injured children, mentally retarded children, Negro vs. white children, etc.; to determine whether and at what point children develop the same frequency characteristics as adults.
Subjects: 30 children at each age level from 5 through 13.
Methods: A verbal corpus is collected from each child by means of story telling to twenty cards of the TAT. Each word is coded for part of speech and a computer program organizes the relative frequency of use of each word, both as a separate lexical unit and as a part of speech. Further analysis of the corpus is planned on sentence units used, remnant of words used in other than communication units, and phrases and clause analysis.
Duration: November 1964-October 1967.
Investigator(s): Joseph M. Wepman, Ph.D., Professor, Departments of Surgery and Psychology, and Wilbur Haas, Ph.D., Assistant Professor of Psychology, University of Chicago, 5848 S. University, Chicago, Ill. 60637.
Cooperating group(s): School systems in Newton, Mass. and Niles and Flossmoor, Ill.; Universities of Florida and Washington; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Possibly a monograph on children's use of language; if not, a series of journal articles on the differences between normal and pathological development of language.

20-FG-6 RESEARCH IN PEDIATRICS

Purpose: Studies in juvenile diabetes mellitus.
Subjects: Juvenile diabetics and their families (parents and siblings).
Methods: Longitudinal study both with regard to medical aspects, and also to growth and physical and emotional development. Emotional development is studied by a psychiatrist (interviews with child, parents and siblings), and psychologist (I.Q., MMPI, etc.) to determine extent of interference with development by problems of the disease.
Duration: December 1965-indefinite.
Investigator(s): John A. Birkbeck, M.B., CH.B., Department of Pediatrics,

University of British Columbia, School of Medicine, Vancouver, B. C.
Cooperating group(s): Vancouver Foundation; Canadian Diabetic Association; Government of Canada Maternal-Child Health Grant.
Publication: Publication pending (hopefully in Diabetes).

20-FG-7 GROWTH STUDIES OF CHILDREN WITH OPERABLE CONGENITAL HEART DISEASE

Purpose: To evaluate developmental status of children prior to corrective open heart surgery, and to make longitudinal postoperative observations at semi-annual and annual intervals which document postsurgical progress.
Subjects: 1,059 examinations made on 255 children.
Methods: Basic data, collected and analyzed according to standard methods described in Bayer and Bayley, Growth Diagnosis, include five anthropometric measurements, five body shape indices, and four photographs. A simultaneous X-ray of the left hand and wrist is assessed for skeletal age. These parameters are plotted comparatively against appropriate norms for both chronological and skeletal age peers in terms of standard deviations from the means. The photographs give additional evidence concerning body configuration. Morphologic observations are correlated with medical, cardiac, neurologic, and ophthalmologic findings.
Findings: Children with congenital cardiac anomalies tend to be smaller than their normal peer population and are retarded in skeletal age and in "shape age." Before cardiac surgery, growth patterns of girls indicate a trend toward the normal status earlier than those of boys. After corrective open heart surgery, groups of boys and girls appear to be slightly closer to their respective normal peers than before. The shift is not as great as might be anticipated. The overall growth pattern of children with operable congenital heart disease tends to be one of retardation rather than of dwarfism.
Duration: July 1962-1969.
Investigator(s): Leona M. Bayer, M.D.; Saul J. Robinson, M.D.; Robert W. Popper, M.D.; John J. Osborn, M.D.; Frank Gerbode, M.D.; and J. A. G. Russell, M.A., Heart Center, Presbyterian Medical Center, San Francisco 15, Calif.

20-FG-8 OBSERVATIONS OF COPING METHODS USED BY CHILDREN WITH CYSTIC FIBROSIS

Purpose: To document methods of coping utilized by preschool children with cystic fibrosis, and by their mothers.
Subjects: 22 children ages two to five years, with cystic fibrosis, and their mothers.
Methods: Three home visits are made to each family by a trained observer with previous experience in home observations. The first visit introduces the parents to the study; the second visit is before, during, and after mealtime; the third is before, during, and after physical therapy (aerosol and postural drainage). Detailed descriptions are written by one or two observers and evaluated by nonobservers for coping techniques employed by parents and children.
Duration: June 1964-September 1966.
Investigator(s): A. Scott Dowling, M.D., Instructor in Child Psychiatry, University Hospitals, Cleveland 6, Ohio.
Cooperating group(s): Departments of Pediatrics and Psychiatry, Western Reserve University School of Medicine.

20-FG-9 A MODEL FOR INVESTIGATING THE RELATIONSHIP OF UNISENSORY AND CROSS-MODAL PERCEPTION WITH CERTAIN EGO FUNCTIONS

Purpose: To develop a series of measures which would prove feasible in use with brain-injured subjects for the purpose of determining relative perceptual competence of subjects in employment of selected sensory modalities, and degree to which integration of sensory experience from several modalities has developed; to apply selected measures of ego function and explore relationships obtaining between ego tests and measures of perceptual competence.
Subjects: Small group of brain-injured children, ages 6 to 12.
Findings: Integration of perceptual experience correlates positively with level of ego function.
Duration: 1964-June 1966.
Investigator(s): Helen First (Ph.D., Candidate), Department of Education and Child Development, Bryn Mawr College, Bryn Mawr, Pa. (Reported by Rachel Dunaway Cox, Ph.D., Chairman, Department of Education and Child Development, Bryn Mawr College.)
Cooperating group(s): The Vanguard School, Haverford, Pa.
Publication: The report will be available on microfilm at Bryn Mawr College Library. Author will answer inquires directed to her through the Department of Education and Child Development of Bryn Mawr College.

20-FG-10 A STUDY OF THE PSYCHOLOGICAL ASPECTS RELATED TO ENDOCRINE DISORDERS IN CHILDHOOD

Purpose: To clarify the impact of the endocrine system on the mental apparatus.
Subjects: Children with precocious puberty, and dwarfism.
Methods: Simultaneous biochemical and psychological data are correlated and integrated. Psychiatric interviewing is chief source of psychological data.
Findings: Precocious puberty results in prerature closure of the ego defenses. Dwarfism's impact is correlated both with the height abnormality and with the type of dwarfism involved.
Duration: 1958-indefinite.
Investigator(s): Marvin B. Krims, M.D., Staff Psychiatrist, Children's Hospital Medical Center, 300 Longwood Ave., Boston, Mass.
Publication: Journal of American Academy of Child Psychiatry 1:3, July 1962. Another article submitted for publication.

20-FG-11 FOLLOW-UP STUDY OF PATIENTS WHO HAVE RECOVERED FROM LEGG-PERTHES DISEASE

Purpose: A study to determine adjustment and development of patients five to 10 years after discharge from hospital: (a) impression of their long term hospital stay; (b) emotional adjustment after a period of regression; (c) ego development; and (d) development of character traits.
Methods: Interviews with former patients and their parents; interview with teachers and review of school records; interview with employers (if any).
Duration: May 1966-May 1968.
Investigator(s): Alan Tomashefsky (M.D. Candidate), and Thesi Bergmann, M.A., Instructor in Child Therapy, Department of Child Psychiatry, School of Medicine, Western Reserve University, Cleveland, Ohio.

20-FG-12 IDENTIFICATION OF ORIENTATION AND MOBILITY SKILLS RELATING TO DEVELOPMENTAL TASKS FOR YOUNG BLIND CHILDREN

Purpose: To identify the essential orientation and mobility skills for young blind children.
Methods: A scale of essential skills is being developed using developmental data based on normal children, related research studies, and observations of experienced teachers. A jury will assist with scaling and judging the significance of the skills.
Duration: July 1965-June 1966.
Investigator(s): Francis E. Lord, Ph.D., Professor, Special Education Center, California State College, 5151 State College Dr., Los Angeles, Calif. 90032.
Publication: Preliminary Scale: September 1966; Revised Scale: July 1967.

20-FG-13 NEUROBIOLOGIC-SOCIOPSYCHOLOGIC CORRELATION OF CLINICAL SEQUELAE WITH BRAIN INJURY CAUSED BY VIRUSES, EXTRACORPOREAL CIRCULATION, OR HYPOTHERMIA

Purpose: Earlier studies of principal investigator have demonstrated that permanent injury to the brain resulting in variable symptoms and signs might be caused by viral-central nervous system illnesses in infancy or early childhood. Study attempts to correlate clinical findings with known risks of brain injury, and to evaluate results in light of hypothesis that maturation potentialities of the brain were impaired. It is proposed that other causes of brain injury may also impair cerebral ontogenesis.
Subjects: Approximately 200 children who have had viral-CNS illnesses (in most instances of laboratory-confirmed etiology) and 200 children with congenital heart defects who undergo surgery with outside circulatory aids and low temperature.
Methods: Children are studied neurologically and psychologically at regular intervals. Those in heart surgery study are examined before and after operation. Some children have been followed for periods up to 13 years. Clinical findings are evaluated statistically and qualitatively to determine their relationship to such factors as age at onset, severity of illness, type of illness, length of circulatory aid, degree of hypothermia.
Findings: For the viral encephalitis group, age at onset appears to be most significant variable in determining presence and severity of sequelae. The younger the patient at time of illness, the greater the likelihood of severe sequelae. To date, cardiovascular surgical experience has rarely resulted in any adverse neurologic and behavioral symptoms and signs.
Duration: 1952-continuing.
Investigator(s): Knox H. Finley, M.D., Director; Philip R. Calanchini, M.D., Assistant Director; and Marjorie P. Honzik, Ph.D., Consultant Psychologist, Institute of Neurological Sciences, Presbyterian Medical Center, Clay and Webster Streets, San Francisco, Calif. 94115.
Cooperating group(s): Association for the Aid of Crippled Children; California State and local Departments of Public Health; National Institute of Neurological Diseases and Blindness and National Heart Institute, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Article submitted for publication; others planned.

20-FG-14 DIFFERENCES IN VERBAL INPUT-OUTPUT IN LABORATORY PSYCHODIAGNOSIS OF CHILDREN

Purpose: To study relationship of Peabody Picture Vocabulary I.Q. (input) to WISC Vocabulary I.Q. (output) with physical setting, diagnosis, and achievement in reading.
Subjects: Drawn from various pediatric, psychiatric and crippled patients.
Methods: Statistical analysis (analysis of variance) to find significance of differences between means.
Duration: October 1965-indefinite.
Investigator(s): Luciano L'Abate, Ph.D., Professor of Psychology, Georgia State College, 33 Gilmen St., S.E., Atlanta, Ga. 30303.
Cooperating group(s): Department of Pediatrics, School of Medicine, Emory University; Crippled Children's Service, Georgia Health Department.
Publication: Pre-publication: Bulletin of the Child Development Laboratory, Georgia State College.

20-FG-15 PSYCHOLOGICAL EFFECTS OF CEREBRAL LESIONS IN CHILDREN

Purpose: To investigate effects on abilities of unilateral cerebral lesions, anterior vs. posterior cerebral lesions, age of onset of cerebral dysfunction, and duration of cerebral dysfunction; to compare groups of children with well-defined cerebral lesions with groups identified as minimally brain-damaged and with groups of mentally retarded children without known cerebral lesions; and to investigate age-related changes in effects of cerebral lesions on abilities.
Subjects: Brain-damaged and nonbrain-damaged children ranging in age from five through 14 years.
Methods: Two batteries of psychological tests, based on procedures devised by Halstead, have been specifically developed for collecting data on subjects.
Duration: September 1959-August 1967.
Investigator(s): Ralph M. Reitan, Ph.D., Professor of Psychology (Neurology) and Director, Section of Neuropsychology; and Robert F. Heimburger, M.D., Professor of Surgery and Director, Section of Neurological Surgery, Medical Center, Indiana University, 1100 W. Michigan St., Indianapolis, Ind. 46207.
Cooperating group(s): Public Health Service, U. S. Department of Health, Education, and Welfare.

20-FG-16 PSYCHOLOGICAL AND EDUCATIONAL STUDIES WITH SPINA BIFIDA CHILDREN

Purpose: To assess educational attainment of a group of 125 spina bifida children and the intellectual, perceptual, neurological, social, and rehabilitation correlates of these attainments; to determine the nature and incidence of educational problems in this group of children.
Subjects: Approximately 125 children with spina bifida and myelomeningocele. Control groups of normal and other disabled children.
Methods: Data gathered from parents, teachers, and children; wide variety of tests: achievement, intellectual, perceptual, learning, and personality.
Duration: October 1965-September 1968.
Investigator(s): Leonard Diller, Ph.D., Chief, Behavioral Sciences, Institute of Physical Medicine and Rehabilitation, New York University Medical Center, 400 E. 34th St., New York, N. Y.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Journal articles planned.

20-FJ-1 CHILDREN'S LOWER-EXTREMITY ORTHOTICS PROBLEMS

Purpose: To initiate a long-term study of the development and treatment of lower-extremity orthotics problems in children. Evaluation of disability and its changing manifestations is being used as a basis for scientific design of corrective devices and for development of corrective procedures.
Subjects: 59 children from 18 months through 16 years with disorders including: pes planus, internal and external rotation deformities of the leg, talipes equinovarus, pes cavus, metatarsus adductus, drop foot, genu valgum, and multiple foot deformities associated with cerebral palsy.
Methods: Standardized methods have been adopted for obtaining motion, still, and X-ray pictures of lower extremities, as well as for measuring and recording axes of rotation of joints. Obtained at regular intervals and compared, records will provide a basis for comparison and evaluation of treatment methods. In addition, these data can be used to determine effects of growth on disability.
Findings: UC-BL Shoe Inserts and the UC Dual-Axis Ankle-Control System (short leg brace) are of value both for amelioration of the symptoms and for assisting in correction of the deformity in certain types of children's orthotics problems.
Duration: August 1964-indefinite.
Investigator(s): Verne T. Inman, M.D., Ph.D., Professor and Chairman, Department of Orthopedic Surgery, and Chairman, Biomechanics Laboratory; and William H. Henderson, B.S., Associate Orthotics Staff Specialist, School of Medicine, University of California, San Francisco, Calif.
Cooperating group(s): Veterans Administration; Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.
Publication: Technical reports in preparation.

20-FJ-2 A KINESTHETIC APPROACH FOR THE PERCEPTUALLY HANDICAPPED

Purpose: To evaluate effect of kinesthetic materials and methods in educational progress of the perceptually handicapped child.
Subjects: 20 students in primary department of Bryan School for Handicapped Children.
Methods: Frostig, Montessori, and other materials of an objective nature are used; kinetic methods include games and exercises to strengthen tactile senses, spatial recognition, and development.
Findings: Observations, visual and tactile, are improved. Comprehension through kinesthetic sense improved other sense areas.
Duration: 1965-1966.
Investigator(s): Ann Reid, Ph.D., Coordinator of Special Education, and Elizabeth Bethell, M.A., Classroom Instructor, Oklahoma City Schools, Oklahoma City, Okla.
Cooperating group(s): Child Study Center.

20-FJ-3 EVALUATING AND TREATING CHILDREN WITH MINIMAL BRAIN DAMAGE FROM A COMBINED NEUROLOGICAL AND PSYCHOLOGICAL POINT OF VIEW

Purpose: To develop individual psychological and neurological methods of assessment (e.g., EEG, neurological responses, perceptual-motor tests), and to establish how these various individual measures might be combined to make maximal predictions and decisions about the minimally brain damaged child; to explore various treatment modalities (e.g., psychopharmacological drugs and prescribed psychological-cognitive exercises) best suited for children differentially diagnosed.

Subjects: All children referred to the Child Development Center of the Worcester Youth Guidance Center.
Methods: Tests of cognitive style, EEG, neurological responses, perceptual-motor tests.
Duration: May 1965-June 1967.
Investigator(s): Manuel Gil, M.D., Head, Child Development Center, and Sebastiano Santostefano, Ph.D., Director of Research, Worcester Youth Guidance Center, 275 Belmont St., Worcester, Mass. 01604.
Cooperating group(s): Worcester State Hospital; Clark University.

20-FJ-4 EFFECT OF GROUP EXPERIENCE ON HANDICAPPED CHILDREN

Purpose: To demonstrate a method for improving mental health of orthopedically handicapped children--participation of handicapped children in socio-recreational groups with nonhandicapped children; and to demonstrate that the method can be implemented through use of existing community centers.
Subjects: 300 elementary school age, handicapped children of both sexes, residing in New York City.
Methods: Subjects are randomly assigned to one of three treatment conditions - control, segregated, or integrated groups and remain in treatment for two years, with a post-treatment follow-up for two years. Instruments to detect changes in adjustment in personality and overt behavior are employed in a "before-and-after" design. Data thus collected are subjected to statistical analysis to test for significant differences among three treatment subgroups. Additional data are collected to determine whether community centers are effective resources for implementation of integrated group method.
Duration: Not reported-April 1968.
Investigator(s): Harold W. Robbins and Carl F. Wells, Ph.D., New York Service for Orthopedically Handicapped, 853 Broadway, New York, N. Y. 10003.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-FJ-5 VALIDITY OF FIVE-YEAR PROPHYLAXIS IN NONCARDIAC RHEUMATICS

Purpose: To investigate validity of discontinuation of prophylaxis in the noncardiac rheumatic patient after a five-year period.
Subjects: Patients who had no evidence of heart disease at time of original illness had five years of prophylaxis, and have had five years without prophylaxis or unusual medical care; patients who had evidence of rheumatic heart disease at time of original illness had five years of prophylaxis, had no evidence of heart disease at end of five-year period, and have had five years without prophylaxis or unusual medical care.
Methods: Quantitative information will be sought through cardiac and physical examination and documentation of interval histories. Specific points for quantitation are: comparative rate of rheumatic recurrences for two age groups; rate of rheumatic recurrences in patients who had carditis with their primary attack and in those who did not; incidence of carditis with post-discontinuation recurrences; incidence of chronic rheumatic heart disease and fatalities; incidence of recurrences in patients with family history of rheumatic fever and in other high risk groups.
Duration: 1966-1971.
Investigator(s): Peter Vlad, M.D., Associate Professor; Dorothy Ehmke, M.D., Assistant Professor; and Denise Huff, M.D., Fellow in Cardiology,

Department of Pediatrics, University of Iowa, Iowa City, Iowa 52241. Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

20-FP-1 THE IMPACT OF THE BIRTH OF A CLEFT LIP-CLEFT PALATE BABY

Purpose: To examine effect of birth of a cleft palate child on parents. Subjects: 100 pairs of parents of cleft lip-cleft palate children under the age of two.
Methods: Questionnaires and personality rating scales.
Duration: December 1965-June 1967.
Investigator(s): Edward Clifford, Ph.D., Assistant Professor of Medical Psychology, Medical Center, Duke University, Durham, N. C. 27706.
Cooperating group(s): National Institute of Dental Research, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Through available professional journals.

Mentally gifted

20-GA-1 SOME RELATIONSHIPS BETWEEN INTELLIGENCE AND CREATIVITY IN GIFTED ADOLESCENTS

Purpose: To explore psychometric characteristics of four groups of subjects. These groups are defined by independent measures of intelligence and creativity.
Subjects: To be selected from approximately 1,100 high school students who have attended the Governor's School of North Carolina, a residential summer program.
Methods: By the use of the Terman Concept Mastery Test as a measure of intelligence and the Revised Art Scale of the Welsh Figure Preference Test as an objective measure of creativity, it is possible to form four independent groups: (1) high on intelligence but low on creativity; (2) high on creativity but low on intelligence; (3) high on both; and (4) low on both. Standard tests and teachers' ratings are dependent variables.
Duration: September 1965-July 1966.
Investigator(s): George S. Welsh, Ph.D., Professor of Psychology, University of North Carolina, Chapel Hill, N. C.
Cooperating group(s): Richardson Foundation, Greensboro, N. C.

20-GA-2 THE RELATIONSHIPS BETWEEN CERTAIN TEACHER CHARACTERISTICS AND ACHIEVEMENT AND CREATIVITY OF GIFTED ELEMENTARY SCHOOL STUDENTS

Purpose: To investigate relationships between certain teacher characteristics and changes manifested by classes of gifted elementary students in convergent and divergent thinking areas.
Subjects: Students and teachers of 38 self-contained intermediate elementary gifted classes located throughout North Carolina.
Methods: Prior to school year, teacher characteristics were assessed through use of Personal Data Questionnaire, California Test of Mental Maturity, and the 16 Personality Factor Questionnaire. Students were

pretested in the fall and post-tested in the spring to assess growth in six convergent production areas. Sequential Tests of Educational Progress and Minnesota Tests of Creative Thinking will be employed. A series of multiple regression equations will be computed to identify those teacher variables that significantly (.01 level) influence class changes in each of the convergent and divergent areas.
Duration: 1965-1967.
Investigator(s): Marvin Gold, Ph.D., Assistant Professor, Education for the Gifted, Division of Special Education and Rehabilitation, Syracuse University, Syracuse, N. Y. 13210; and Shirley R. McNary, M.A. (formerly Graduate Student, Syracuse University), 12 S. Frederick Ave., Gaithersburg, Md.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

Mentally retarded

20-HA-1 SOCIO-BEHAVIORAL STUDY CENTER FOR MENTAL RETARDATION RESEARCH

Purpose: To determine ways of studying prognosis of the mentally retarded individual in his development as related to institutional life, interaction with family, and with the larger social structure.
Subjects: Mentally retarded children and adults in hospital and community.
Methods: In the hospital various methods are applied in an epidemiological investigation of treatment programs, patient morbidity and mortality, program evaluation, and physiological and growth abnormalities. In the community, methodology is directed toward location and identification of the mentally retarded and comparison of retarded with normal population.
Duration: October 1964-September 1971.
Investigator(s): Harvey F. Dingman, Ph.D., Program Director, Socio-Behavioral Laboratory, Pacific State Hospital, Pomona, Calif.; and George Tarjan, M.D., Professor of Psychiatry, School of Medicine and School of Public Health, University of California at Los Angeles, Los Angeles, Calif.
Cooperating group(s): Health Sciences Computing Facility, University of California at Los Angeles; California State Department of Mental Hygiene; Western Interstate Commission for Higher Education; and Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Approximately 100 articles published; many others in progress. Reprints available on request.

20-HA-2 REGIONAL COOPERATION IN MENTAL RETARDATION DATA COLLECTION AND RESEARCH IN WESTERN UNITED STATES

Purpose: To collect data on residents of western state institutions for mentally retarded; to stimulate and facilitate mental retardation research.
Subjects: All residents of all state institutions for the retarded in the 13 western states.
Methods: Standard population census form is completed for each resident by ward level personnel at state institutions.
Duration: June 1965-December 1966.
Investigator(s): Dan Payne, M.A., Co-Director, Western Interstate Commission for Higher Education, University East Campus, 30th St., Boulder, Colo. (Reported by Robert H. Kroepsch, Director, Western Interstate Commission for Higher Education.)

Cooperating group(s): 19 western state institutions; National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Data will be provided on request.

20-HD-1 DIFFERENTIATION OF ORGANIC EDUCABLE MENTALLY RETARDED CHILDREN FROM NON-ORGANIC ON THE MINNESOTA PERCEPTO-DIAGNOSTIC TEST

Purpose: To develop a more refined scoring system for the MPD Test than exists at present in hopes to increase its discriminative validity as an index of brain damage in the mentally retarded.
Subjects: 36 brain-damaged and 36 nonbrain-damaged educable retarded children on which additional diagnostic signs have been developed. A cross-validation sample will consist of approximately 60 subjects in each group.
Findings: Two new diagnostic signs, separations and loss of gestalt, have been added to the rotational score of the MPD Test which together identified 86 percent of the brain-damaged educable retarded subjects. Subjects are now being tested to cross-validate these initial findings.
Duration: September 1965-August 1966.
Investigator(s): Gerald B. Fuller, Ph.D., Director of Clinical Research, Willmar State Hospital, Willmar; and Alastair Burnett, Ph.D., Chief Psychologist, Owatonna State School, Owatonna, Minn.
Publication: To be submitted to the *Journal of Clinical Psychology*.

20-HD-2 DEVELOPMENTAL DIAGNOSTIC STUDIES IN MENTAL DEFICIENCY

Purpose: To provide a qualitative analysis of developmental defect; specifically, the standardization and extension of the developmental evaluative techniques of Else Haeussermann; and psychophysiological studies of behavioral disturbances implicated in developmental failure with emphasis on parameters derived from the area of classical conditioning.
Subjects: Normal neonates and those with suspected brain damage; retarded children and those with psychiatric disturbances; siblings of patient groups; normal school children.
Methods: Standardization of Haeussermann Test involves determination of age values for each test item; codifying administration and interpretation of test; and extension of test to age range below two years. The psychophysiological studies concern performance of patient and normal children in studies of autonomic conditioning, motor conditioning, and word association. Behavioral and autonomic measures in response to stimulation are also being obtained in neonates in an attempt to identify early signs of cerebral defect.
Duration: September 1964-August 1967.
Investigator(s): Joseph Wortis, M.D., Director, Division of Pediatric Psychiatry, Jewish Hospital of Brooklyn, 555 Prospect Pl., Brooklyn, N. Y. 11201.
Cooperating group(s): National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Results to be published in medical and psychological journals as data are analyzed.

20-HD-3 REFINING OF URINE SCREENING TEST FOR CHONDROITINS

Purpose: To evaluate validity and precision of various procedures for determination of urinary mucopolysaccharides; to search for mentally retarded individuals with concurrent presence of enormous excretion of mucopolysaccharides, in whom the disease has not been previously described; and to gain further knowledge and understanding on pathology and therapeutic treatments of patients with Hurler's syndrome.
Subjects: Patients with clinically confirmed Hurler's syndrome and those nonambulatory and severely mentally retarded.
Methods: Determinations of mucopolysaccharides are performed on urine of individuals with Hurler's syndrome, with and without therapeutic treatment, and of those without Hurler's syndrome. Procedures used include toluidine blue staining spot test, hexuronic acid by carbazole test, acid albumin turbidimetric test (done on both dialyzed and undialyzed specimens), gross acid albumin turbidity test (brief observation of the turbidity appeared after mixing the acid albumin reagent and the undialyzed urine at acidic pH), and urine (dialyzed and hydrolyzed) reducing power.
Findings: Preliminary results indicate that both the toluidine blue staining spot test and the gross acid albumin turbidity test appear to be satisfactory for screening; the former requires a longer time and tends to have more false positive results than latter.
Duration: April 1964-March 1967.
Investigator(s): Charles H. Carter, M.D., Medical and Research Director, Sunland Hospital, Box 3513, Orlando, Fla. 32802.

20-HG-1 CASE RECORD ANALYSIS

Purpose: To determine some of the characteristics of retarded children attending one of the first retardation clinics in the country.
Subjects: 500 children, a random sample of one-third of all cases served in the Division of Pediatric Psychiatry in first ten years of its existence; subjects are primarily retarded children, but other psychiatric disorders are included as well.
Methods: Preparation of a method of case record analysis, including decisions on categories of information to be abstracted from record and preparation of coding sheets; selection of sample and abstracting of data; transfer of information to data cards; analysis of data.
Findings: Most retarded children served are in "moderate" category or below (I.Q. of 50 or less). While patients are drawn from all social classes, there is some evidence that low social class is under-represented. Encephalopathy of unknown cause, mental retardation of unknown cause, and Down's syndrome are most frequently diagnosed.
Duration: September 1957-August 1965.
Investigator(s): Joseph Wortis, M.D., Director, Division of Pediatric Psychiatry, and Helen Wortis, M.S., Research Associate, Jewish Hospital of Brooklyn, 555 Prospect Pl., Brooklyn, N. Y. 11201.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: "Families With Two or More Mentally Retarded or Mentally Disturbed Siblings: The Preponderance of Males" accepted for publication in *American Journal of Mental Deficiency*; other publications planned; mimeographed reports available.

20-HG-2 A COMPARATIVE ANALYSIS OF THE NATURE OF EDUCABLE MENTALLY RETARDED ADOLESCENTS' EXPRESSED LEVEL OF UNDERSTANDING OF SELECTED OCCUPATIONS

Purpose: To investigate the nature of educable mentally retarded adolescent children's expressed level of understanding of selected occupations as compared to intellectually normal children of comparable general chronological and mental ages; to investigate relationships between the expressed level of understanding of selected occupations by adolescent mentally retarded children and their own chronological and mental ages.
Subjects: 50 adolescent educable mentally retarded junior high school students enrolled in the public school program in cities in Northern Illinois; 50 adolescent intellectually normal junior high school students in the public schools; and 50 intellectually normal elementary school students enrolled in the public schools.
Methods: All subjects were interviewed in two, 45-minute interviews regarding their understanding of 14 selected occupations representing seven occupational areas--commercial, personal service, agriculture, mechanical, professional, esthetic, and scientific. Specific occupations selected for the areas were secretary, insurance salesman, cook, barber, dairy farmer, poultryman, automobile mechanic, carpenter, dentist, teacher, actor, musician, pharmacist, and weatherman. Pictures of persons engaged in each of the selected occupations were shown to subjects prior to interview to ascertain that each subject could identify the occupation. School records were examined for data regarding ability, parent occupation, and date of birth.
Findings: Levels of understanding of educable mentally retarded adolescents and intellectually normal children of comparable general chronological age did differ significantly. Levels of understanding of educable mentally retarded adolescents and intellectually normal children of comparable general mental age did differ significantly. Levels of understanding of educable mentally retarded adolescents among the seven major areas of occupations did differ significantly. There were no significant differences in relationships among expressed levels of understanding of educable mentally retarded adolescents for each of seven major areas of occupations and their own chronological age. Relationship between level of expressed understanding of adolescent educable mentally retarded subjects and their mental age was significant in occupational areas of agriculture, mechanical, and esthetic. There were no significant relationships established for other areas.
Duration: January 1965-January 1966.
Investigator(s): Elmer J. Kuhn, Ed.D., Assistant Professor of Education, Northern Illinois University, DeKalb, Ill. 60115.
Publication: Doctoral dissertation, Michigan State University, E. Lansing, Michigan. Soon to be submitted for publication.

20-HG-3 AN INVESTIGATION OF THE DEVELOPMENT OF SOCIAL BEHAVIORS IN RETARDED CHILDREN

Purpose: To investigate some variables which influence development or lack of development of social behaviors in autistic and retarded children.
Subjects: Residents of the Children's Colony at Coolidge, Arizona, including those with autistic schizophrenia, brain damage and other forms of retardation.
Methods: Operant conditioning procedures are used to explore possibility of shaping social behaviors in children whose social repertoires are limited. In particular, cooperative response as defined by Azrin and Lindsley is studied. Variables such as amount, kind, and schedule of social reinforcement and their effects on development of cooperative and other social responses are studied.

BEST COPY AVAILABLE

Duration: June 1965-fall 1966.
Investigator(s): Ralph J. Wetzel, Ph.D., Assistant Professor of Psychology, University of Arizona, Tucson, Ariz.
Cooperating group(s): Arizona State Department of Health.

20-HG-4 PILOT STUDY: ASSESSING NONVERBAL DIVERGENT THINKING IN RETARDED CHILDREN

Purpose: To determine whether, and in what ways, a newly developed nonverbal test of divergent thinking might discriminate between the performance of a group of educable mentally retarded children and a group of nonretarded regular grade children of comparable age.
Subjects: 42 educable mentally retarded children from special classes in a public school system and 42 nonretarded regular grade children ranging in intelligence from average to superior, with chronological ages between 9-1/2 and 10-1/2.
Methods: Test of certain factors in nonverbal divergent thinking (Tangram Test) administered individually to each subject; photographic technique used for recording subjects' productions.
Findings: On measure of ideational fluency, scores of retarded and normal subjects did not differ significantly. Differences in ideational flexibility were highly significant, favoring the normal group. Elaboration scores were significantly higher for retarded subjects. However, this difference was not paralleled by a superiority in originality, for normal subjects also scored significantly higher in this area.
Duration: April 1965-continuing.
Investigator(s): George Brabner, Jr., Ph.D., Associate Professor of Education, and Benson Becker, Research Assistant, Ferkauf Graduate School of Education, Yeshiva University, New York, N. Y. 10003.
Cooperating group(s): Northern New Jersey Public School Systems.
Publication: To be submitted to *Exceptional Children* or *American Journal of Mental Deficiency*.

20-HG-5 DIRECTIONALITY AND OCULAR-MANUAL LATERALITY IN EDUCABLE MENTAL RETARDATES

Purpose: To determine relationships among various measures of ocular-manual laterality, directionality, and achievement.
Subjects: Approximately 40 educable mental retardates from Johnstone Training and Research Center.
Methods: Each is administered tests of handedness, eyedness, directionality (Road Map Test), following directions (Wells Concrete Directions), and achievement (Wide Range Achievement). Results are analyzed by intercorrelations to determine relationships among variables.
Duration: March 1966-August 1966.
Investigator(s): Rudolph J. Capobianco, Ed.D., Research Scientist, Edward R. Johnstone Training and Research Center, Bordentown, N. J. 08505.
Publication: To be submitted to an appropriate professional journal.

20-HG-6 A STUDY OF SELF-AWARENESS IN GROUP WORK WITH ADOLESCENT RETARDATES

Purpose: To investigate various facets of self-awareness within a group work counseling setting of adolescent retardates; to investigate parental attitudes and their relation to self-awareness in the retardate.
Subjects: 12 adolescent male and 12 adolescent female retardates.

Methods: Measures of self-concept as well as measures of intelligence and personality; parental attitude measures; process recordings of group discussions analyzed for content relating to above areas.
Duration: 1965-1966.
Investigator(s): Alan Barclay, Ph.D., Associate Professor of Psychology, Department of Pediatrics, and A. Thaman, M.S.W., Chief Social Worker, Child Development Clinic, St. Louis University, St. Louis, Mo.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.
Publication: To be submitted to American Journal of Mental Deficiency.

20-HG-7 LONGITUDINAL STUDY OF NUTRITIONALLY DEPRIVED AND ENRICHED MENTAL RETARDATES

Purpose: To determine whether growth phenomenon is specific to normals alone.
Subjects: 5,500 retardates and control population matched by ages.
Duration: May 1966-1971.
Investigator(s): Charles C. Cleland, Ph.D., Associate Professor, and Ralph Hanna, M.D., Assistant Professor, Department of Special Education, University of Texas, Austin, Tex. 78712.

20-HG-8 STUDY OF ACTIVE THOUGHT ORGANIZATION IN RETARDATES

Purpose: To explore whether approaching mental retardates from conceptual framework of developmental psychology leads to a more fruitful examination of differences and similarities between retardates and normals.
Subjects: Retardates and normals matched for M.A.
Methods: Tests of visual perception, touch, and smell are being developed, yielding efficiency scores in each of these areas.
Duration: March 1965-June 1966.
Investigator(s): Samuel E. Stayton, Ph.D., Staff Psychologist, Worcester Youth Guidance Center, 275 Belmont St., Worcester, Mass. 01604. (Reported by Sebastiano Santostefano, Ph.D., Director of Research, Worcester Youth Guidance Center.)
Cooperating group(s): Worcester Area Comprehensive Care Center for the Mentally Retarded.

20-HG-9 PROBLEM BEHAVIOR IN RETARDED AND DISTURBED ADOLESCENTS

Purpose: To develop a reliable means of describing and communicating the problem behavior patterns of atypical (i.e., retarded, brain damaged, schizophrenic, behavior disordered) adolescents, and to assess relationships that may exist between these behavior patterns and a variety of demographic and historic information.
Methods: Factor analytic and other multivariate methods are employed in defining behavioral factors and patterns in atypical adolescents and in a normal group. Test-retest reliability as well as more long-term stability of scores will be assessed. The latter also allows an initial glimpse at the prognostic utility of different behavior patterns.
Duration: July 1965-June 1967.
Investigator(s): George Spivack, Ph.D., Director of Research, and Jules Spotts, M.A., Research Psychologist, Devereux Schools, Devon, Pa.
Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.

20-HG-10 VERBAL AUDITORY SCREENING OF THE MENTALLY RETARDED

Purpose: To investigate a suitable method of testing the hearing of severely retarded children; to determine incidence of hearing loss among institutionalized retarded children.
Subjects: 252 retarded children at Faribault State School and Hospital, ages five to 16.
Methods: THE VERBAL AUDITORY SCREEN FOR CHILDREN (VASC), a speech audiometer, was used to test the hearing of these retarded children.
Findings: Depending on criterion, retarded children had from two to six times as great a percentage of hearing loss as normal children. The VASC was found to be useful in detecting hearing impairment among institutionalized mentally retarded children. Hearing evaluation required about five minutes, and children with as low as thirty months M.A. could be tested satisfactorily.
Duration: December 1962-December 1965.
Investigator(s): Stuart Dansinger, M.A., School Psychologist, Board of Education, Duluth; and Arnold A. Madow, Chief Psychologist, Faribault State School and Hospital, Faribault, Minn.
Publication: Paper in press.

20-HH-1 CLIMATOLOGICAL INFLUENCES IN RETARDATION

Purpose: To investigate relationship between season of conception and subsequent birth of mental defectives; to assess possible differential influence of season of conception upon institutionalized retardates ordered along the parameters of ethnicity, level of retardation, sex, and education level of parents.
Subjects: Total resident population in the Special Schools (institutional) in Texas. (N = 11,000)
Methods: Epidemiological analysis of the birth dates of retardates for the past 25 years in the State of Texas.
Findings: More retarded children seem to have been conceived, relative to expectation based upon the Texas live birth rate, in the hotter months of the year, this effect being heightened in Latin Americans. Seasonal variations in month of birth among retardates also show wide differences with respect to parent education level.
Duration: June 1965-November 1965.
Investigator(s): Ira Iscoe, Ph.D., Professor of Psychology; Charles C. Cleland, Ph.D., Associate Professor of Special Education; and William F. Patton, M.A., Research Associate, Vocational Rehabilitation Administration Research and Training Center, University of Texas, Austin, Tex. 78712.
Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.
Publication: Submitted to psychological journals.

20-HJ-1 EFFECTS OF TRAINING PROCEDURES ON VISUAL DISCRIMINATION LEARNING AND TRANSFER IN RETARDED AND NORMAL CHILDREN

Purpose: To investigate effectiveness of two training procedures--titration and verbal instructions--on learning and transfer of a two-choice simultaneous visual discrimination involving spatial separation of stimulus and response.
Subjects: 72 experimentally naive subjects, consisting of 36 trainable retardates and 36 normal nursery school children, equated on M.A. and socio-economic level.

Methods: Three groups, each consisting of 12 trainable retardates and 12 normal nursery school children, were treated identically on a transfer task, following three different types of training. Verbal instructions group was given specific verbal instructions designed to direct attention to relevant cues; titration group was trained by the technique of "shaping" observing responses by successive approximations, i.e., by beginning training with stimulus contiguous with response blocks and then gradually increasing the separation; control group was trained with stimuli placed six inches above response blocks and without aid of any attention-focusing technique. Training problem was a simple two-choice, simultaneous visual discrimination involving two dimensions--color and form. Transfer task was also a color-form pattern discrimination with the restriction that each subject receive a different color and form to that received in training.
Findings: Statistically significant differences were found between the control group and the experimental groups, indicating that training procedures facilitated learning and transfer. Differences between retarded and normals were significant only in the control condition, where absence of attention-focusing cues especially penalized retardates.
Investigator(s): Sister M. Athanasius Cunningham, Ph.D., Clinical Psychologist, Sisters of Charity of the Incarnate Word, San Antonio, Tex. (Reported by Norman A. Milgram, Ph.D., Associate Professor, Child Center, Catholic University of America, Washington, D. C. 20017.)
Publication: Ph.D. dissertation, Catholic University of America, 1965.

20-HJ-2 THE INFLUENCE OF VERBAL STATEMENTS UPON THE PERFORMANCE OF MENTALLY RETARDED CHILDREN

Purpose: To determine influence of verbal statements on learning tasks performed by mentally retarded children.
Subjects: Educable mentally retarded children obtaining extreme scores on Children's Manifest Anxiety Scale.
Methods: Two experimental groups are subjected to verbal statements designated as "encouraging" and "discouraging" issued by an authority figure immediately prior to and during exposure to a digit substitution, a concept formation, and an object assembly task. A third group designated "neutral" or control group is exposed to same learning tasks but without prior verbal statements. Upon completion of learning tasks, performance of the two experimental groups and the control group will be compared on each learning task. Analysis of main and interaction effects of the two independent variables on the dependent variables will be accomplished through analysis of variance techniques.
Investigator(s): Godfrey D. Stevens, Ph.M., Ed.D., Professor, Program in Special Education and Rehabilitation, and Richard K. Myers, M.S., University of Pittsburgh, Pittsburgh, Pa. 15009.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-HN-1 BIOCHEMISTRY OF MONGOLISM--PKU

Purpose: To elucidate the disease entity.
Subjects: Clinical patients.
Methods: Biochemical research.
Duration: 1961-continuing.
Investigator(s): Martin D. Appleton, Ph.D., Professor of Chemistry, University of Scranton, Scranton, Pa.
Cooperating group(s): Scranton Foundation; National Science Foundation; Public Health Service, U. S. Department of Health, Education, and Welfare.

20-HN-2 EPIDEMIOLOGY OF DOWN'S SYNDROME (MONGOLISM)

Purpose: To demonstrate any differences in occurrence of Down's syndrome in time and space, and other factors of possible etiological importance.

Subjects: All children born between 1951 and 1960 in selected California counties and diagnosed as having Down's syndrome.

Methods: Varied and extensive case-finding methods. Geographic areas to be investigated represent both urban and rural, with differences in climate, agriculture, and other variables.

Investigator(s): Robert W. Day, M.D., California State Department of Public Health, 2151 Berkeley Way, Berkeley, Calif. 94704.

Cooperating group(s): National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-HP-1 A COMPARISON OF FILM STRIPS, EYE PUFF, AND MOTION PICTURE TECHNIQUES IN THE AUDIOMETRIC CONDITIONING OF MENTALLY RETARDED CHILDREN

Purpose: A follow-up of a study done in 1965 to develop a more effective and more motivating method of testing hearing of mentally retarded children, many of whom may have higher I.Q.'s and more academic potential than now realized due to a hearing loss.

Subjects: 105 children with I.Q.'s of 30 to 70; 40 children with I.Q.'s of 0 to 30.

Methods: Three conditioning methods are employed: (1) filmstrip--child presses button in response to tone in order to view next frame in Walt Disney-type story; (2) eye puff--child is presented with tone in earphone immediately followed by puff of air to make eye blink. When conditioned, eye blink occurs upon hearing tone alone; (3) motion picture--similar to filmstrip, but able to sustain interest longer. Testing takes much longer with this method.

Findings: Both filmstrip and eye-puff techniques are extremely effective.

Duration: March 1965-July 1966.

Investigator(s): Ross M. Weaver, M.S., Assistant Professor of Speech and Audiology, Brigham Young University, Provo, Utah 84601.

Cooperating group(s): Utah State Training School.

20-HP-2 TRAINING PRESCHOOL RETARDATES IN FOCAL ATTENTION AT HOME BY PARENTS

Purpose: To explore whether training with retardates in focal attention (i.e., the process of deploying attention selectively, inspecting an object while excluding attention from others) would foster emergence and development of higher level functions (e.g., form discrimination, concept formation) which are presumed to emerge from more basic process of focal attention; to determine advantages and disadvantages of having such training conducted at home by parents of retardates.

Subjects: 70 retardates, boys and girls, attending a preschool program; half are assigned to at-home training condition, half represent controls.

Methods: Materials: magnetic boards and plywood cutouts, white and black, circles, squares, and triangles with magnets fixed to one side. A training program was devised, using these materials, and consisting of 22 levels increasing in complexity. With each level, an array of cutouts is placed on the board and child is trained, with verbal instruction and pantomime, to remove a specific cutout, while leaving others behind. Parents administer training for a 12-week period at home. During training, parents meet as a group to discuss child-management problems concerned with conducting training. Pre- and post-training criterion measures are obtained (e.g., of directionality, of concept formation). These will be compared with criterion measures of controls obtained before and after an equal interval of time.

Findings: Work to date indicates that majority of experimental subjects show significant improvement in one or more areas measured after training, and that effects of prescribed activity on parent-child relationships appear important for study and treatment.

Duration: November 1964-June 1966.

Investigator(s): Sebastiano Santostefano, Ph.D., Director of Research, Worcester Youth Guidance Center, 275 Belmont St., Worcester, Mass. 01604.

Cooperating group(s): Massachusetts Division of Mental Hygiene; nursery schools for retardates in Needham, Norwood, and Fitchburg, Massachusetts.

Publication: Work presented at 1966 annual meeting of American Orthopsychiatric Association; total study to be published.

20-HP-3 SUSTAINED VERSUS INTERRUPTED INSTITUTIONAL EFFECTS ON RETARDATES

Purpose: To explore the impact of summer furloughs vs. no furloughs on cognitive and noncognitive aspects of retardates.

Subjects: 150 educable and trainable mental retardates.

Methods: Standardized self-concept, anxiety, achievement measures before and after summer furlough, to assess effects of sustained vs. interrupted institutionalization; other demographic and sociometric measures to be included plus attendant parental attitudes.

Findings: Pilot work suggests slight achievement score gains favoring those who do not receive furloughs.

Duration: April-November 1966.

Investigator(s): Charles C. Cleland, Ph.D., Associate Professor of Special Education and Research Director, Vocational Rehabilitation Administration and Training Center in Retardation, University of Texas, Austin, Tex.

Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.

Publication: Pilot work presented to Third Kennedy Scientific Symposium, Boston, Mass., to be published by Kennedy Foundation. Second study in *American Journal of Mental Deficiency*.

20-HR-1 MENTAL RETARDATION SERVICES BOARD

Purpose: To provide mentally retarded children with rehabilitation services through coordination of services in large metropolitan area.

Subjects: Mentally retarded children in six communities of Los Angeles County.

Duration: August 1965-July 1968.

Investigator(s): Zev W. Wanderer, Ph.D., Project Director, 537 S. Wilton Pl., 90005; and Ivy P. Mooring, Ph.D., Mental Retardation Services Board, 1313 W. 8th St., Los Angeles, Calif. 90017.

Cooperating group(s): County of Los Angeles; State of California; Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.

Publication: When appropriate, in scientific journals.

20-HR-2 PROGRAMMING TO IMPROVE SOCIAL SKILLS OF RETARDATES

Purpose: Based on the observation that institutionalized retardates have a lower social quotient than do noninstitutionalized retardates of the same I.Q. entering Fairview Home, this project is concerned with providing an experientially designed program closely attuned to the experience of family, home, and community living to overcome this deficit.
Subjects: 96 moderately to mildly retarded boys and girls between the ages of 6 and 13.
Methods: Adaptation of an already established curriculum guide to the cottage living, recreation, and religious programs and activities through coordinated involvement of all personnel now charged with direct patient care, treatment, and training. An on-the-scene unit treatment staff coordinates program planning and implementation, and direct program application to each individual in project population. Results are evaluated against baseline data established for both patients and program personnel before start of project.
Duration: Not reported-1971.
Investigator(s): James M. Pomeroy, M.D., Superintendent, and Ruth Jaynes, M.S.W., Psychiatric Social Worker, Oregon Fairview Home, 2250 Strong Rd., S.E., Salem, Oreg. 97310. (Reported by Loring F. Chapman, Ph.D., Director of Research, Oregon Fairview Home.)
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-HR-3 EFFECTIVENESS OF A PLACEMENT-ORIENTED SPECIAL WORK ADJUSTMENT PROGRAM FOR MENTALLY RETARDED ADOLESCENTS AND YOUNG ADULTS WITH A HISTORY OF SCHOOL DROPOUT

Purpose: To demonstrate value of a special work adjustment program for mentally retarded young people with a history of school dropout; to test techniques (including remunerative work) which may contribute to employment success of this group.
Subjects: Mentally retarded individuals (approximate I.Q. range 55 to 80) who are potentially feasible for employment in industry but have failed to achieve a satisfactory vocational adjustment in community subsequent to leaving school.
Methods: Following services are offered to subjects: remunerative work experience (including work evaluation, personal adjustment training, and supportive work experience), individual and group employment counseling, intensive special placement, parent counseling, group work and recreation, and remedial instruction. An evaluation service tests values of this program through maintaining suitable records and reports, studying clients as individuals and in groups, and conducting follow-up activities.
Duration: October 1964-September 1967.
Investigator(s): Milton Cohen, Executive Director, Federation of the Handicapped, 211 W. 14th St., New York, N. Y. 10011.
Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.

20-HT-1 SOCIALIZATION OF RETARDATES: A CASE STUDY IN INSTITUTIONAL GOAL REORIENTATION

Purpose: To explore implications of drawing on the theoretical concept, socialization, to formulate a treatment program for retardates within the framework of resources available at an institution beginning to reorient

from custodial patterns of care. The focal questions are: (1) What kind of program might be addressed to those specific behaviors of the retardate, other than his intellectual deficits, that were labelled inappropriate in the community and that led to his extrusion to the Training School?; (2) What are the organizational issues that must be addressed for such a program to exist within the Training School?; and (3) What are the effects of such a program on the retardates and on the staff?
Methods: A variety of systematic and unsystematic inductive techniques ranging from participant observations to factor analysis of interview and rating data.
Investigator(s): Ann C. Maney, Ph.D., Mental Health Study Center, National Institute of Mental Health, 2340 University Blvd., East, Adelphi, Md. 20783.
Cooperating group(s): Social Research Section, Division of Health Affairs, University of North Carolina; O'Berry Training School, Goldsboro, N. C.; North Carolina State Hospital Board of Control.
Publication: American Journal of Mental Deficiency 69:3:372-384, November 1964.

20-HT-2 A FOLLOW-UP STUDY OF PATIENTS LEGALLY COMMITTED TO A STATE INSTITUTION FOR THE RETARDED

Purpose: To investigate reasons for admission of this group, their characteristics with regard to age, I.Q., family, and social background, and to follow their prognosis over seven years.
Subjects: 142 patients committed to Dr. Joseph H. Ladd School, Exeter, R. I., over years 1958 to 1965: 126 committed by family court, 16 as defective delinquents.
Methods: Total admissions and commitments to the institution over 57 years are studied, mean I.Q. values obtained, social, medical histories studied, and prognosis determined as, discharged from care, transferred to other institutions, or on placement with supervision.
Findings: 57 percent are still institutionalized, 14 percent discharged, 26 percent in community on placement. Chief reasons for admission are sexual offenses, crimes against property, behavioral disorder. Offenses in 11 to 20 age group outnumbered all other groups three to one. Mean I.Q. was 60, suggestive of good capacity yet only 14 percent were discharged.
Investigator(s): Robert B. Kugel, M.D., Professor of Child Health, Child Health and Development Center, Brown University, Providence, R. I. 02912.

20-HT-3 AN INVESTIGATION OF FACTORS CONTRIBUTING TO SUCCESSFUL AND NONSUCCESSFUL COMMUNITY ADJUSTMENT OF DISCHARGED RETARDATES

Purpose: To determine predictive elements in past life trajectories, particularly in infancy and childhood, that are most closely associated with post-discharge success and nonsuccess in several separate behavior categories; to identify good risks for later vocational training, and poor risks for new, better, and earlier habilitation techniques.
Subjects: 575 patients discharged from July 1952 through June 1961 from Pineland Hospital and Training Center, Maine's state institutional facility for the education, training, and care of the mentally subnormal.
Methods: Study of three life periods: birth to admission, institutional, post-discharge (at least four years); psychological, social, cultural, experiential, symptomatic factors, and post-discharge: employment, financial, legal-illegal, personal, social network, and constellation problems. Information obtained by detailed predischarge case histories, multiple

facet post-discharge interviews with patient and/or intimates, and official records of state agencies, civil authorities, and institutions. Data transferred to 25 standard IBM cards per patient (14,375 cards for the study). Statistical description and analysis through IBM 1620 Computer and disc pack.
Findings: First 314 cases: substantiation of large proportion of unfavorable pre-institutional backgrounds, including relatively large numbers of siblings, poorly educated, emotionally disturbed parents of lowest social class origins, disrupted families - during childhood about 80 percent of patients had structural breaks in adult family constellations, averaging three such breaks per patient.
Duration: July 1964-June 1969.
Investigator(s): Peter W. Bowman, M.D., Superintendent, and John L. Hoffman, Ph.D., Social Research Scientist, Pineland Hospital and Training Center, Pownal, Me. 04069.
Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.
Publication: Final report to Vocational Rehabilitation Administration in 1969; articles planned for various journals before and after that date; comprehensive single publication subject to future circumstances; predischarge characteristics of first 314 cases reported on at Northeastern Regional Conference of American Association on Mental Deficiency, September 24, 1965, in Portland, Me.

20-HT-4 NORTRIPTYLINE HYDROCHLORIDE IN THE TREATMENT OF ENURESIS IN MENTALLY RETARDED BOYS

Purpose: To evaluate the effectiveness of nortriptyline hydrochloride as a control agent in enuresis.
Subjects: 34 mentally retarded boys who wet the bed five or more nights in a 20-day period.
Methods: Two-part double-blind design. Part I consists of three 20-day periods: (1) observation of frequency of enuresis without medication; (2) half of the group receives 25 mg. nortriptyline and the other half a matching placebo; and (3) the medication and placebo are reversed. Part II involves two 10-day periods: (1) no medication for either group; and (2) 25 mg. nortriptyline for both groups.
Findings: Statistically significant difference in enuretic frequency between drug and nondrug conditions. Twenty of the 34 boys' enuresis decreased by approximately 50 percent or more at the end of Part II. About two-thirds of the "improved" group maintained gains after a three-month period without medication.
Duration: July 1965-March 1966.
Investigator(s): Ernest H. Smith, M.A., Psychologist, and Raphael Gonzalez, M.D., Psychiatric Consultant, Wayne County Training School, 16000 Sheldon Rd., Northville, Mich. 48167.
Cooperating group(s): Eli Lilly and Company.
Publication: Submitted for publication.

20-HW-1 ATTITUDES OF PARENTS OF HIGH AND LOW SOCIAL CLASS LEVELS TOWARD THEIR EDUCABLE MENTALLY HANDICAPPED CHILDREN

Purpose: To investigate attitudes of parents of high and low social class levels toward their educable mentally handicapped children.
Subjects: 100 parents of upper-middle social class level, and 100 parents of lower-lower social class level.

Methods: Parental attitudes and reaction toward their children are determined through their responses to an incomplete sentence form. Parental estimates of their children's abilities are determined through responses to a questionnaire form. Responses of both social classes are compared.
Duration: Not reported-August 1966.
Investigator(s): Richard P. Iano (Graduate Student, Division of Special Education and Rehabilitation, Syracuse University), 148 Greenwood Ave., Wyncote, Pa. 19095; G. Orville Johnson, Ed.D., and Andrew L. Shotick, Ph.D., Professors of Special Education; and William F. Anderson, Ph.D., Professor of Psychology and Education, Syracuse University, Syracuse, N. Y.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

Emotional disturbances

20-IA-1 INDEX OF CHILDHOOD PSYCHOSIS

Purpose: Based on material from an earlier study on childhood psychosis (Research Relating to Children, Bulletin 18), to study relevant key concepts, theories, and data of this area.
Methods: Use of tape recordings of sessions of psychotherapy in a modification of the Hampstead Index.
Duration: 1966-indefinite.
Investigator(s): Rudolf Ekstein, Ph.D., Director, Project on Childhood Psychosis; Elaine Caruth, Ph.D.; Seymour Friedman, M.D.; and Mortimer Meyer, Ph.D., Reiss-Davis Clinic for Child Guidance, 9760 W. Pico Blvd., Los Angeles, Calif. 90035.
Publication: Ekstein, Rudolf, Children of Time and Space, of Action and Impulse--Clinical Studies on the Psychoanalytic Treatment of Severely Disturbed Children, Appleton-Century-Crofts, Inc., April 1966.

20-ID-1 PERCEPTUAL DISSONANCE AND ROLE LEARNING

Purpose: To develop a test of parent perception which would hopefully reflect parent identification and psychosexual role orientation; to determine if such a measure would differentiate between patients and normal controls and especially those patients who typically have psychosexual role confusion; and to test the hypothesis that a pattern of parent perception strongly indicative of inappropriate parent identification would differentiate certain groups of mental patients from normal controls.
Subjects: 26 paranoid schizophrenics, 26 other schizophrenics, 26 alcoholics, 26 neurotics, and 26 normal controls, all males, matched for age and socio-economic status; also 500 school children from grades four through 12.
Methods: Questionnaire administered to subjects and hypothesis tested by analysis of variance on three clusters of items which are negative perceptions of father, maternal closeness and overprotection, and dissonant perceptions of father. The latter cluster of items consisted of two types: (1) the mother was preferred or idealized over father in some manner, that is, a preference was stated, and (2) the mother disqualified father in some way.
Findings: Significant differences were found between paranoid schizophrenics, other type schizophrenics, and alcoholics, and normals on these three clusters of items. Neurotics did not differ significantly from

normals.
Duration: Fall 1963-continuing.
Investigator(s): Kenneth R. Piety, Ph.D., Assistant Chief, Psychology Services, Veterans Administration Hospital, Murfreesboro, Tenn. 37130.
Publication: *Journal of Clinical Psychology* 22:1:10-14, January 1966. Investigator plans to write papers on cross-validation studies. A few reprints of the original study are still available from investigator.

20-IG-1 ANTISOCIAL BEHAVIOR IN EARLY CHILDHOOD

Purpose: To focus on an area of mental illness in early childhood designated as antisocial character development.
Subjects: 20 to 24 children and their parents plus a group of 10 or more control children and their parents.
Methods: Hypotheses have been set up pertaining to influences of parents on the children in the study group which are related to the antisocial development of the children. Carefully prepared material from interviews with the parents is made available to independent raters who are employed to test the hypotheses.
Duration: October 1962-not reported.
Investigator(s): David E. Reiser, M.D., Director, and Catherine Roff, Ph.D., Assistant Director, James Jackson Putnam Children's Center, 244 Townsend St., Boston, Mass. 02121.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-IG-2 INCIPIENT STUTTERING AND SPONTANEOUS REMISSION OF STUTTERED SPEECH

Purpose: To determine incidence of incipient stuttering symptoms and percentage of those who experience spontaneous remission of these symptoms; to determine differences in symptomatology and some parental behaviors between those who experience spontaneous remission of stuttered speech and those who do not.
Subjects: Approximately 5,000 subjects sampled in kindergarten to 9th grade in six schools in western New York.
Methods: Survey questionnaire was developed in pilot study utilizing 400 subjects enrolled in Campus School at State University of New York College at Buffalo. Subjects took the questionnaire home to be completed by parents and returned within one week.
Findings: (1) Incipient stuttering reported in approximately 10 percent of sampled population; (2) a large majority of parents admonished children with suggestions for elimination of symptoms; (3) age at onset for most of subjects was between two years-six months and three years-six months; and (4) duration of symptoms for most subjects was two years with the large majority experiencing spontaneous remission of symptoms by age six.
Duration: February-May 1966.
Investigator(s): Stanley Dickson, Ed.D., Professor of Speech Pathology and Audiology, State University of New York, College at Buffalo, Buffalo 22, N. Y. (Reported by Horace Mann, Ph.D., Director, Division of Exceptional Children, State University of New York, College at Buffalo.)
Cooperating group(s): Williamsville Central Schools, Williamsville, N. Y.
Publication: To be submitted to *Journal of Speech and Hearing Research*.

20-IG-3 STUDY OF THE CONTRIBUTION OF FAMILY VARIABLES TO THE ETIOLOGY OF STAMMER

Purpose: To isolate factors in the family which contribute to emergence and perpetuation of stammer; to develop a theoretical model and methods of studying the family applicable to clinical problems in general.
Methods: Phase 1. Formulation of hypotheses to be derived from family therapy with a small number of family groups; Phase 2. Systematic testing of these hypotheses.
Duration: March 1965-March 1969.
Investigator(s): Eleanora S. Wertheim (Ph.D. Candidate), Senior Psychologist, Royal Children's Hospital, Parkville, Melbourne, Australia.
Cooperating group(s): Royal Children's Hospital Research Foundation.

20-IG-4 DEVELOPMENT OF LANGUAGE BEHAVIOR IN AUTISTIC CHILD

Purpose: To develop verbal and nonverbal communication behavior in a mute autistic boy, who was essentially nonresponsive to environmental stimuli of any kind.
Subjects: Four-and-a-half year old boy who did not speak, had inconsistent hearing, and unusual behavior consisting of periods of "finger flicking" and sitting very still and staring off into space.
Methods: Operant conditioning procedures are main treatment variable, with changes in form and frequency of verbal and nonverbal behavior as dependent variables. Conditions have been devised or arranged in a number of tasks and activities to prompt, develop, and maintain new behaviors. These conditions were designed to increase attending behavior to human face, mouth, and speech stimuli, rate of emission of vocal and nonvocal responses of several forms, positive reinforcement value of people, and rate of discriminative nonvocal and vocal responses to auditory and associated visual stimuli.
Findings: Increase in frequency and variety of verbal and nonverbal behavior.
Duration: October 1965-September 1966.
Investigator(s): Robert E. Schell, Ph.D., Assistant Professor, Department of Psychology, Michigan State University, East Lansing, Mich.; Joel Stark, Ph.D.; and Jane J. Giddan, M.A., Institute for Childhood Aphasia, School of Medicine, Stanford University, Palo Alto, Calif.
Cooperating group(s): California Scottish Rite Foundation; Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: To be submitted for publication in speech or psychology journal.

20-IG-5 SOME CLINICAL OBSERVATIONS OF TRICHOTILLOMANIA IN CHILDREN

Purpose: To investigate selected social and psychological characteristics of trichotillomania in children; to study patterns of family relationships and life history events that are related to the clinical picture of trichotillomania in a small group of female patients.
Methods: Bibliographical study and review of medical, psychiatric, and psychoanalytic literature in this area; survey of records of presenting complaints of all patients referred to Mental Health Study Center since 1952 to determine number, age, sex, and referral source of all children referred with trichotillomania as presenting problem; and clinical analysis of intake interviews, psychological tests (when available), and psychiatric examinations of children and their families evaluated at the Mental Health Study Center since 1962 with trichotillomania as the major problem at time

of referral.
Duration: 1964-1966.
Investigator(s): Fortune V. Mannino, Ph.D., Director, Consultation Services, and Rafael A. Delgado, M.D., Consultant in Child Psychiatry, Mental Health Study Center, National Institute of Mental Health, 2340 University Blvd. East, Adelphi, Md. 20783.

20-IG-6 EARLY INFANTILE AUTISM: ETIOLOGY, TREATMENT, PARENTAL INFLUENCES

Purpose: To test two central hypotheses concerning etiology of early infantile autism, and the parental influences in the recovery process.
Subjects: Ten children between ages two and five, and their parents.
Methods: In a clinical-experimental setting, children are subjected to high-impact sensory stimulation of strongly affective quality (to compensate for hypothesized sensory deprivation). Developmental growth of children is measured at fixed intervals with Rating Scales, Developmental Scales, Intelligence and Social Maturity Tests, etc. Films are also taken.
Findings: Five subjects seen to date have shown remarkable growth in intellectual, social, affective, and motoric behavior.
Duration: April 1965-March 1972.
Investigator(s): Austin M. DesLauriers, Ph.D., Head, Psychology Department, and Carole F. Carlson, Ph.D., Research Associate, Michael Reese Hospital, Psychiatric Institute, 29th and Ellis, Chicago, Ill. 60616.
Publication: Book on theory and findings is planned for 1967.

20-IG-7 AN INVESTIGATION OF THE RELATIONSHIP BETWEEN ANXIETY AND THE PRESENCE OR ABSENCE OF FORMAL FEEDBACK IN AUTO-INSTRUCTIONAL PROGRAMS

Purpose: To investigate interacting effects of anxiety level and feedback on learning by programmed instruction.
Subjects: 44 girls and 36 boys in fifth grade who scored at extreme high and low ends of the distribution on the Test Anxiety Scale for Children (TASC).
Methods: Boys and girls constituted separate samples because previous research has shown that girls score higher on the TASC than boys, and their scores correlate higher on subject matter tests. High-anxious and low-anxious subjects were assigned to feedback and no-feedback versions of a programmed lesson on earth-sun relationships in a two by two design. Programs were identical, except one supplied feedback and other did not. Following completion of program (mean time was two hours, forty-five minutes), subjects were tested to measure immediate retention of program content. Nineteen days later, subjects were retested to measure delayed retention.
Findings: Significant interaction of anxiety and feedback was obtained for girls, but no significant interaction was obtained for boys. Same held true for post-test on retention data.
Duration: January 1964-February 1965.
Investigator(s): Peggie L. Campeau, M.A., American Institute for Research in the Behavioral Sciences, Station A, P.O. Box 11487, Palo Alto, Calif. 94306.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Final report to Office of Education.

20-IP-1 A PROGRAM FOR THE OUTPATIENT EVALUATION OF PSYCHOPHARMACOLOGICAL AGENTS IN CHILDHOOD SCHIZOPHRENIA

Purpose: To assess the behavioral effects of Thorazine and Benadryl in psychotic children who are living at home.
Subjects: Children diagnosed schizophrenic between the ages of five and 10, who are on the waiting list of a school for severely emotionally disturbed children.
Methods: Subjects are evaluated by a psychiatrist, psychologist and neurologist. In addition, the mothers are interviewed concerning the children's past and current functioning. Subjects are then assigned randomly to one of three groups: Thorazine, Benadryl and placebo, which are given in liquid form. For the first four weeks, children are on an increasing fixed dosage schedule; during the next four weeks dosage is regulated by the psychiatrist. While on medication, children are seen weekly. Maximum dosage during first four weeks is: Thorazine 150 mg., Benadryl 300 mg., daily. Children are re-evaluated and baseline measures repeated four and eight weeks after treatment.
Duration: January 1965-1971.
Investigator(s): David M. Engelhardt, M.D., Professor of Psychiatry, State University of New York, Downstate Medical Center, 600 Albany Ave., Brooklyn, N. Y. 11203.

20-IP-2 RELATIONAL BEHAVIOR OF MOTHERS AND THEIR SCHIZOPHRENIC CHILDREN

Purpose: To discover potential pathogenic influence of verbal communication.
Subjects: 35 schizophrenic children and their mothers.
Methods: 20-minute interviews for each child, observed through one-way mirror and recorded by tape and movie.
Duration: 1962-1969.
Investigator(s): David M. Levy, M.D., Research Consultant; William Goldfarb, M.D., Ph.D., Director; and Donald Meyers, M.D., Research Associate, Henry Ittleson Center for Child Research, Jewish Board of Guardians, 5050 Iselin Ave., Bronx, N. Y. 10471.
Cooperating group(s): Ittleson Family Foundation; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Papers read at American Orthopsychiatric Association meeting, 1962; New York Academy of Science, 1963; and Bidecennial meeting, Columbia University, 1965.

20-IP-3 GROWTH AND FAMILY PATTERNS IN CHILDHOOD SCHIZOPHRENIA

Subjects: 100 schizophrenic children and their families.
Methods: Psychiatric study; serial psychological and clinical investigations; and semi-structured and structured studies of relational behavior.
Duration: 1961-1969.
Investigator(s): William Goldfarb, M.D., Ph.D., Director, Henry Ittleson Center for Child Research, Jewish Board of Guardians, 5050 Iselin Ave., Bronx, N. Y. 10471.
Cooperating group(s): Ittleson Family Foundation; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: List of publications available from investigator.

20-IP-4 COPING BEHAVIOR IN SCHIZOPHRENIA AND RELATED CONDITIONS

Purpose: To study patterns of coping with interpersonal stress. Families with a schizophrenic adolescent will be compared with families with moderately disturbed adolescents having subclinical schizophreniform symptoms, acting-out symptoms, and neurotic symptoms. These groups will be compared with normal controls. Also, specific attributes of coping behavior of schizophrenic and adolescent groups to cues related to intrafamilial conflicts will be investigated.
Methods: Controlled role-playing in interpersonal dyads and triads of family groups in handling problems which various members of the family have identified as critical; semi-structured interviews of child-rearing patterns, and coping styles of adolescents in handling problems in various aspects of functioning, such as conflicts, autonomy, acceptance of responsibility, etc.; and specific experimental situations to investigate coping styles.
Duration: 1964-1969.
Investigator(s): Eliot H. Rodnick, Ph.D., Professor of Psychology, and Michael J. Goldstein, Ph.D., Associate Professor of Psychology, University of California, Los Angeles, Calif. 90024.
Cooperating group(s): Camarillo State Hospital, California State Department of Mental Hygiene; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Publication planned in appropriate journals.

20-IP-5 EXPERIMENTAL STUDY OF FAMILIES WITH SCHIZOPHRENICS

Purpose: To develop a method for the experimental study of interaction among family members; to subject to critical examination several prominent hypotheses about patterns of interaction and communication in families with schizophrenic children.
Subjects: 36 families with a schizophrenic child, and a control group of 24 normal families.
Methods: Parents and schizophrenic child are brought into a controlled experimental situation, using Strodtbeck's method of "revealed differences" to obtain a "sample of interaction". Characteristics of family interaction are measured through 13 independent coding systems especially developed for this purpose. Interaction in schizophrenic families is compared with interaction in normal families; each family serves as own control since parents take part in two discussion sessions, once with one child and a second time with another child in same family. Sex and pre-morbid history of patient is also controlled.
Duration: 1963-1966.
Investigator(s): Elliot G. Mishler, Ph.D., Director of Psychological Research, Massachusetts Mental Health Center, and Clinical Associate in Psychology, and Nancy E. Waxler, Ph.D., Research Associate in Psychology, Department of Psychiatry, Harvard Medical School, Boston, Mass. 02115.
Cooperating group(s): National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-IS-1 AUDITORY PERCEPTION OF PARENTAL VOICES IN DISTURBED FAMILIES

Purpose: To determine whether parental voices are equally perceived within the family, and to discover whose voice the child responds to.
Subjects: A sequential sample of 20 families presenting themselves at the Montreal Jewish General Hospital's Family Psychiatry Clinic, plus a

863

sample of nonclinical families matched for family size, constitution, age of children, etc.
Methods: Both parents are told to read three groups of sentences - positive, neutral, and negative in content - into a tape recorder. Then parents' voices are played through earphones simultaneously into the child's ears at the same decibel level. The child is then asked to recall words heard and recalled from a given sample. The difference between the number of words spoken by the parents is noted.
Findings: Disturbed children hear one parent's voice much more than the other's. This is unaffected by gross changes in volume. Normal children and undisturbed siblings hear both parents more or less equally, and their perception is affected by factors such as volume.
Duration: 1965-1966.
Investigator(s): Vivian Rakoff, M.A., Assistant Director of Research, and John Sigal, Ph.D., Associate Director of Research, Department of Psychiatry, Jewish General Hospital, Montreal 26, Que.
Cooperating group(s): Quebec Mental Health Grant.

20-IS-2 REPROGRAMMING THE SOCIAL ENVIRONMENT OF DEVIANT CHILDREN

Purpose: To provide a behavior modification program which alters the social environment in which the deviant child lives.
Subjects: Preschool and primary grade children.
Methods: Conditioning procedures are used in classroom and in homes to change reinforcement schedules being used by parents and peers. In first phase of the study, nonsocial reinforcers are used to change the interaction within a social system. This implies that in second stage of procedure, behavior of members in social system are being maintained by other members of group.
Findings: The observation data from three families show marked reduction in symptom behavior of child when child is treated by other members of his social group.
Duration: 1965-indefinite.
Investigator(s): Gerald R. Patterson, Ph.D., Professor of Psychology, University of Oregon, Eugene, Oreg.
Publication: Journal of Child Psychology and Psychiatry, in press; another article submitted to Journal of Experimental Child Psychology.

20-IV-1 BEHAVIOR THERAPY AND STUTTERING

Purpose: To apply principles of behavior therapy to stutterers and to evaluate their effectiveness.
Subjects: 30 adolescent stutterers, age 16 and over.
Methods: Therapy principles based on learning theory and modeled similarly to those espoused by Wolpe and by Eysenck.
Duration: January 1966-December 1968.
Investigator(s): Burl B. Gray, Ph.D., Director of Research, Speech Pathology, and Gene England, Ph.D., Director, Monterey Institute for Speech and Hearing, Monterey, Calif.
Publication: Plan to publish materials in pertinent speech pathology and psychology journals.

20-IV-2 THE EFFICACY OF SHORT-TERM PARENT COUNSELING GROUPS FOR CASES ON THE THERAPY WAITING LIST

Purpose: To determine effectiveness of short-term parent counseling groups in improving parent-child relationships and fostering constructive personality change in children.
Subjects: Parent couples on a child guidance clinic waiting list who met criteria of mild to moderate disturbance.
Methods: Short-term parent counseling groups were conducted. These groups were structured, with focus maintained on parent-child issues and with parental as well as therapist participation kept at high levels. Parent self-report questionnaires provided quantitative outcome indices. Research design included an own-control feature so that changes during counseling could be compared with changes during a comparable period of no clinic involvement prior to counseling.
Findings: Data on two six-session groups suggest that positive changes in parents' evaluation of themselves and their children may be attributable to the counseling group experience. Certain independently rated patient role characteristics, such as disposition to critically explore one's own behavior, appear to differentiate high improvers from those who gain little.
Duration: January 1965-indefinite.
Investigator(s): Ralph Bierman, Ph.D., Senior Clinical Psychologist, and David Hallowitz, M.S.S.W., Assistant Director and Chief Psychiatric Social Worker, The Psychiatric Clinic, Inc., Central Park Plaza, Buffalo, N. Y. 14214.
Publication: Paper read at the annual meeting of the American Orthopsychiatric Association, San Francisco, Calif., April 1966. Digest published in American Journal of Orthopsychiatry 36:290-291, 1966.

20-IV-3 CHILDRENS' DREAMS AND INTRA-FAMILIAL COMMUNICATION

Purpose: To improve treatment of children through the use of childrens' dreams.
Subjects: Clinic population.
Methods: Family conferences to discuss the ability of parents to recognize their child's dreams; statistical analysis to determine improvement of familial communication as a result of study of child's dreams.
Duration: September 1965-indefinite.
Investigator(s): Irving Markowitz, M.D., Director, Child Guidance Clinic, 115 S. Munn Ave., East Orange, N. J.
Publication: "An Investigation of Parental Recognition of Children's Dreams - a Preliminary Report," by Irving Markowitz, M.D., Joseph C. Mark, Ph.D., and Stanley Seiderman, M.S.S.S. Other publications are planned in the course of research.

20-IV-4 RETURNING TO THE GROUP: DYNAMICS OF THE "LATE" PHASES IN GROUP THERAPY

Purpose: To establish reasons for former terminations and resumption of therapy, and to determine course of final phase of treatment through examination of protocol from four groups involved in group therapy.
Subjects: Four simultaneously conducted groups, each having a life of between two and four years: (1) children and adolescents, (2) delinquents, (3) a mixed adult group, and (4) a geriatric group. Each group has one or more patients who have returned to their respective groups after an average cessation of therapy of seven and one-half months.
Methods: Group psychotherapy.

865

Duration: 1963-1967.
Investigator(s): Hans A. Illing, Ph.D., Senior Psychiatric Social Worker, Parole Outpatient Clinic, California State Department of Corrections, 107 S. Broadway, Los Angeles 12, Calif.
Publication: Publication is planned after completion of project, possibly in 1967.

20-IV-5 THE APPLICATION OF A THREE-LEVEL THEORY OF LEARNING TO REORIENTING THE SOCIALLY HOSTILE PRESCHOOL CHILD

Purpose: To attempt, by a series of steps, through conditioning for more acceptable behavior, conceptualization about the benefits of more acceptable behavior, and development of a verbalized self-concept as to the kind of child who acts acceptably, to build a stable socially acceptable pattern of behavior in a child.
Subjects: Five three- and four-year old children.
Methods: Using five college students to reinforce all tendencies toward acceptable behavior as these are shown on a kindergarten playground.
Findings: Five of the children showed definite improvement at level one. Three of the children were able to reach level two. One of the children reached level three.
Duration: September 1964-June 1965.
Investigator(s): John A. R. Wilson, Ed.D., Associate Professor of Education, University of California, Santa Barbara, Calif.
Cooperating group(s): Catholic Welfare Bureau; Neighborhood House.
Publication: Report to California Educational Research Association.

20-IV-6 REMEDIATION OF DISTURBED AND RETARDED CHILDREN

Purpose: To develop broad range, interdisciplinary educational and behavioral methods for the treatment of disturbed and retarded children.
Methods: A multidisciplinary research program with many separate and integrated studies.
Duration: September 1965-indefinite.
Investigator(s): Herbert C. Quay, Ph.D., Research Director, Children's Research Center, and Samuel A. Kirk, Ph.D., Professor of Education and Psychology, and Director, Institute for Research on Exceptional Children, University of Illinois, Urbana, Ill.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Articles in professional journals and books are planned.

20-IV-7 DIAGNOSTIC EVALUATIONS OF CHILDREN FOR INDIVIDUAL PSYCHOTHERAPY THROUGH FAMILY INTERVIEWS

Purpose: To assess possibilities of using conjoint family interviews to assess quickly and decisively the diagnosis and therapeutic needs of children brought to a general psychiatric clinic for individual therapy; to see if the operations of the diagnostic process can be hastened; and to standardize the interviews through filmed, recorded, and written records to obtain definite criteria of success or failure in approach.
Subjects: Families who apply to the hospital child psychiatry clinic.
Methods: Minimal number of family interviews to determine therapy; follow-

up of families and comparison with those processed in conventional manner.
Duration: April 1965-1967.
Investigator(s): Edward Mason, M.D., Assistant Professor, Harvard School of Public Health; Norman Bernstein, M.D., Assistant Director, and Herbert Cline, M.D., Assistant Psychiatrist, Child Psychiatry Unit, Massachusetts General Hospital, Burnham 7, Boston, Mass. 02114.
Publication: Preliminary report was planned for April 1966.

20-IV-8 A THERAPEUTIC CLUB: ALTERNATIVE TO RESIDENTIAL CARE

Purpose: To determine whether the technique used as an alternative to residential treatment or hospitalization of disturbed latency-age children can be modified to treat equally disturbed pre-pubertal and pubertal children; to learn whether the collaboration of clinicians and group workers can bridge the conceptional gap which exists between the two disciplines and thereby contribute to increased utilization of community centers and settlement houses in mental health work.
Subjects: 6 to 10 latency age boys with severe ego impairment, behavior disturbances, and unfavorable home conditions, referred to the clinic and considered otherwise untreatable in the community.
Methods: Boys will meet as a club five afternoons per week, after school, utilizing facilities of community center. Individual therapy, casework with families and school.
Duration: September 1965-February 1968.
Investigator(s): Roy K. Lilleskov, M.D., Psychiatric Director, James Weldon Johnson Mental Health Clinic, 2089 3rd Ave., New York, N. Y. 10029. (Reported by Monique Diethelm, Administrative Director, James Weldon Johnson Mental Health Clinic.)
Cooperating group(s): National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Paper presented at Child Welfare League of America, spring 1965. Submitted for publication.

20-IV-9 TECHNIQUES OF PLAY THERAPY FOR MODIFYING THE BEHAVIOR OF WITHDRAWN THIRD GRADE BOYS

Purpose: To compare effectiveness of three group play situations in modifying behavior of shy, withdrawn, third grade boys.
Subjects: 11 third grade boys from Torrance (Calif.) Unified School District, referred by teachers and principals as being socially withdrawn, very quiet, introverted, friendless, lacking in spontaneity, maladjusted, but not so withdrawn as to be unable to attend school regularly.
Methods: Weekly therapy session was held for 14 consecutive weeks. A "new" type of play therapy was used on the first group in which tangible rewards were used to reinforce social-approach behavior. Rewards were tokens which could be traded for candy, toys, and trinkets at end of each therapy hour or saved across sessions to obtain more expensive items. Second group was treated similarly to first, but tangible rewards were not used. Third group met without a therapist and acted as a control. Mothers met in guidance groups while sons were in therapy sessions.
Findings: Productivity, anxiety, general psychological adjustment, and discrete problem behavior showed no systematic change over time, nor were there differences which seemed related to the independent variables between the three types of treatment. Some of the observation data demonstrated systematic differences between groups and reliable changes over time, i.e., therapy sessions.

Duration: September 1965-September 1966.
Investigator(s): Paul W. Clement, Ph.D., Instructor of Medical Psychology (in residence), Harbor General Hospital, Medical School, University of California at Los Angeles, Torrance, Calif. 90509.
Cooperating group(s): Attending Staff Association, Harbor General Hospital; Torrance Unified School District, Torrance, Calif.
Publication: Report to be submitted to Journal of Consulting Psychology in fall of 1966.

20-IY-1 GROUP VALUES, FRIENDSHIPS, AND GROUP FORMATION AMONG EMOTIONALLY DISTURBED ADOLESCENTS IN A RESIDENTIAL SCHOOL AND THERAPEUTIC CAMPING SITUATION

Purpose: To study the nature of small group formation among emotionally disturbed adolescents in a residential treatment center; to explore the possible rationales or values that may determine friendship choice, and certain motivational parameters in such adolescents.
Subjects: Approximately 110 emotionally disturbed youngsters between the ages of 14 and 19, who are not psychotic or retarded, but who exhibit a variety of behavioral disturbances and neurotic symptoms.
Methods: Social-distance questionnaires, ratings of popularity, a measure of I.Q., anxiety level, impulsivity, and social activity level were employed; sociogram techniques were also employed. Males and females were studied separately, and the study was done twice (during the school year and during a summer camping season).
Findings: (1) Females formed tight cliquish groups more than males; (2) groups that form are homogeneous as defined by a number of the variables measured; (3) popularity is largely determined by positive or socially acceptable values and behavior; (4) a camp setting diffuses small cliquish groups and increases chances for positive staff infusion to effect adolescent behavior.
Duration: May-August 1964.
Investigator(s): George Spivack, Ph.D., Research Director, Devereux Schools, Devon, Pa.
Publication: Unpublished manuscript.

20-IY-2 A TEMPORAL ANALYSIS OF CRITICAL CLASSROOM BEHAVIOR IN INSTITUTIONALIZED EMOTIONALLY DISTURBED CHILDREN

Purpose: To compare critical classroom behavior of institutionalized emotionally disturbed children with a matched group of public school children.
Subjects: 20 children attending Ypsilanti State Hospital School.
Methods: Objective observation.
Duration: February 1965-February 1967.
Investigator(s): Joseph Motto, Ph.D., Professor of Special Education, Eastern Michigan University, Ypsilanti, Mich.
Cooperating group(s): Ypsilanti State Hospital School.
Publication: To publish in Exceptional Children.

20-IY-3 SOME POSSIBLE DETERMINANTS OF STAFF-STUDENT RELATIONS IN RESIDENTIAL TREATMENT SITUATION

Purpose: To determine whether an emotionally disturbed adolescent's desire

BEST COPY AVAILABLE

to relate to a particular staff person is determined by the "chemistry" of staff person's temperament and certain facets of adolescent's personality.
Methods: Temperament ratings on staff personnel; a number of personality ratings and other background information on a group of emotionally disturbed adolescent boys and girls; and a measure of "admiration for staff" completed by every adolescent on every staff member. These data should reveal whether adolescents with particular personalities tend to gravitate toward staff personnel with certain characteristics, and should offer some insights into those staff roles and particular staff characteristics associated with being held in high esteem in the eyes of emotionally disturbed adolescents.
Duration: Completed.
Investigator(s): George Spivack, Ph.D., Director of Research, and Jules Spotts, M.A., Devereux Schools, Devon, Pa.
Cooperating group(s): The Devereux Foundation.

20-IY-4 SOCIAL SYSTEM RESEARCH - DEMONSTRATION IN CHILD CARE

Purpose: To help emotionally disturbed and delinquent adolescent boys in residential treatment translate their needs and problems into the formulation and execution of autonomous group goals.
Subjects: 54 boys, ages 14 through 16, exhibiting antisocial behavior.
Methods: Subjects comprise intermediate unit of three residential cottages. Demonstration cottage is staffed with child care counselors with college backgrounds and is compared with two other cottages staffed by untrained personnel. Comparison is based on continuing independent observation, reflected in descriptive reporting and systematic ratings, and on questionnaires ascertaining values and cottage role structure, administered to all boys in the unit before and after introduction of demonstration staff in one cottage. Additionally, counselor ratings of segments of group interaction in demonstration cottage document the process of increasing autonomous goal striving.
Duration: May 1965-April 1967.
Investigator(s): Howard W. Polsky, Ph.D.; Daniel S. Claster, Ph.D.; and Carl Goldberg, Hawthorne Cedar Knolls School, 293 Linda Ave., Hawthorne, N. Y.
Cooperating group(s): Jewish Board of Guardians (New York City); National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Book in preparation.

Social deviancy

Note: Some of the following delinquency studies were taken from the section, "Current Projects," in the *International Bibliography on Crime and Delinquency*. This publication is prepared by the National Clearinghouse for Mental Health Information of the National Institute of Mental Health (Bethesda, Maryland 20014) from source material provided by the National Council on Crime and Delinquency (44 East 23rd St., New York, N. Y. 10010). The studies are noted: (Reported by NCCD.).

20-JA-1 RECENT TRENDS IN ILLEGITIMACY, 1955-1964

Purpose: To analyze trends in illegitimacy during the past 10 years, and the differentials in illegitimacy between various groups in the population.
Subjects: 50 percent sample of birth certificates from 34 states and the District of Columbia. These states have certificates which ask for legitimacy status of child. From these reports estimates of illegitimate births are made for the United States as a whole.
Methods: Two measures are used to discuss relative occurrence of illegitimate births: (1) illegitimacy rate (illegitimate births per 1,000 unmarried women aged 15 to 44) to describe the risk of an unmarried woman having a child; and (2) the illegitimacy ratio (illegitimate births per 1,000 total births) to learn the proportion of births that are illegitimate. The different risks of having an illegitimate child are discussed for age and color groups for the United States between 1955 and 1964, and between various states for 1960. Use is made of research done by others in order to explain reasons for some of the differences between groups in the population, and an attempt is made to test several hypotheses related to the rapid increase in illegitimacy during the 1940's and early 1950's.
Findings: The increase in the number of illegitimate births during the past few years is due far more to increased numbers of women at risk than increased risks of an unmarried woman having a child.
Duration: 1965-1966.
Investigator(s): Alice J. Clague, B.A., Statistician in Demography, National Center for Health Statistics, Public Health Service, U. S. Department of Health, Education, and Welfare, Washington, D. C. 20201.
Publication: *Monthly Vital Statistics Report, Highlights from the National Center for Health Statistics*, June 14, 1966; also forthcoming detailed report in NCHS Series 21.

20-JG-1 THE ESTABLISHMENT OF A DATA RESERVOIR FOR JUVENILE DELINQUENCY

Purpose: To create a store of data open to social scientists for research projects in juvenile delinquency; to stimulate research in juvenile delinquency; to provide potentiality for development of norms and baselines on variables of concern to institutions, courts, public agencies, schools, and students; to test specific hypotheses of interest to the Berkshire Farm Institute for Training and Research.
Subjects: All boys in the Berkshire Farm population on a continuing basis.
Methods: Data are gathered from case records, psychological tests, and staff ratings; records are systematically culled, psychological tests routinely administered and staff ratings periodically obtained. Items are coded and entered on a summary sheet in preparation for IBM card storage. Project is still exploratory and is planned to include new items and exclude old ones on basis of experience with the system and upon determination of what might be some of the relevant dimensions of juvenile delinquency. When the procedure is functioning smoothly, other institutions in the United States and perhaps abroad will be asked to cooperate with the program.
Duration: October 1964-not reported.
Investigator(s): Monroe M. Lefkowitz, Ph.D., Research Director, Berkshire Farm Institute for Training and Research, Canaan, N. Y. 12029.
Publication: Data will be made available at first informally through request to principal investigator; as project continues, a more formal system will be developed for dissemination of data.

20-JG-2 JUVENILE DELINQUENCY IN TAIWAN

Purpose: To improve judicial administration and to prevent delinquency; to uncover complicated factors contributing to the growth of juvenile delinquency in Taiwan.
Methods: Individual case studies and interviews were used to obtain information on family background, education, and social environment of juvenile delinquents.
Duration: December 1964-June 1965.
Investigator(s): Chau-Yuen Chu, College of Law, National Taiwan University, Taipei, Taiwan, China. (Reported by NCCD.)
Cooperating group(s): Ministry of Justice, Republic of China.

20-JJ-1 TYPES AND PATTERNS OF JUVENILE DELINQUENCY

Purpose: To develop a measure of delinquency that will make it possible to predict delinquent careers from an early portion thereof, or to reconstruct a total pattern of delinquency from that portion known to police; to determine if adult criminal careers may be predicted from various types and patterns of delinquency.
Subjects: Juveniles with police contacts, 1,876 from Madison and 2,191 from Racine, Wisconsin.

Findings: Police contact rates have relatively stable patterns that are associated with social areas of middle-sized cities. Referral rates have increased disproportionately to police contact rates. Increased proportion of police contacts has probably given rise to the mistaken impression that juvenile delinquency is increasing at a higher rate than it is in fact.
Investigator(s): Lyle W. Shannon, Ph.D., Professor and Chairman, Department of Sociology and Anthropology, University of Iowa, Iowa City, Iowa.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-JJ-2 REPLICATION OF GLUECK, S. AND E., *UNRAVELING JUVENILE DELINQUENCY* ON 250 DELINQUENTS AND 250 MATCHED NONDELINQUENTS IN PUERTO RICO

Purpose: To repeat main features of *Unraveling Juvenile Delinquency* in Puerto Rico in order to determine which findings of original study are indigenous to Boston and which may reasonably be regarded as etiologic constants.
Subjects: 250 delinquents and 250 matched nondelinquents in Puerto Rico.
Methods: Intensive social investigation of family and personal background of 250 delinquents and 250 matched nondelinquents, delinquency history, psychiatric interview, psychological testing (Wechsler-Bellevue Form 1), analysis of body build from photographs, using method developed in *Unraveling Juvenile Delinquency*, general medical examination, neurological examination, and Rorschach Test.
Duration: July 1965-June 1971.
Investigator(s): Sheldon Glueck, Ph.D., LL.D., Director, and Eleanor T. Glueck, Ed.D., Co-Director, Research Project into the Causes, Management, and Prevention of Juvenile Delinquency, Harvard Law School, 3 Garden St., Cambridge, Mass. 02138; and Franco Ferracuti, M.D., Professor, Institute of Criminal Anthropology, University of Rome, Rome, Italy, and Director, Program for Training and Research in Criminology, Social Science Research Center, University of Puerto Rico, Rio Piedras, Puerto Rico.
Cooperating group(s): University of Puerto Rico; Government of Puerto Rico (Office of Juvenile Affairs); Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: *Unraveling Juvenile Delinquency*, by S. and E. Glueck. Cambridge, Mass.: Harvard University Press, 1950.

20-JM-1 PERSONALITY PATTERNS OF DELINQUENT, TRUANT, AND WELL-ADJUSTED ADOLESCENT GIRLS AS MEASURED BY PROJECTIVE TECHNIQUES

Purpose: To identify delinquent personality patterns for possible early diagnosis and prevention.
Subjects: 40 delinquent, 28 truant, and 23 well-adjusted adolescent girls, age 12 to 18, all white, native-born.
Methods: Administration of Wechsler scales; 10 selected TAT cards; Rosenzweig Picture-Frustration Test, Adult Form; and an interview concerning social background, school and peer adjustment; collection of data pertaining to school progress and adjustment from school records and institutional records.
Findings: Significant differences in social background: more delinquents and truants come from broken homes than do controls (well-adjusted); more delinquents had previous placements than either of the other groups; fewer belong to formal youth groups. The only significant test difference is in the P-F Group Conformity Rating which is lowest for delinquents.

Duration: 1953-1965.
Investigator(s): Helena W. Temmer, Ph.D., Principal Psychologist, Children's Unit, New Jersey Neuro-Psychiatric Institute, Box 1000, Princeton, N. J. 08540.
Publication: The abstract was submitted for consideration to the Eastern Psychological Association 1966; further plans to be made later.

20-JM-2 COMPARISON OF EXPRESSED ACCEPTANCE OF SELF AND OF OTHERS, AND RESPONSES ON THE BLACKY PICTURES OF TWO ADOLESCENT GROUPS

Purpose: To compare responses of 14-year old delinquent and nondelinquent females on a measure of expressed acceptance of self and of others, and on a measure of psychosexual development, to determine if delinquent females are more self-rejecting.
Subjects: 14-year old delinquent females and matched 14-year old nondelinquent females; comparison group of 14-year old nondelinquent males.
Methods: Subjects receive Berger Questionnaire (self-acceptance), Blacky Pictures, and a new form (female) of Blacky Pictures devised for this study. Responses are compared with nondelinquent groups.
Duration: April 1965-May 1966.
Investigator(s): Sandra A. Robinson (Ed.D. Candidate, University of California at Los Angeles), 816 Victor, No. 5, Inglewood, Calif. 90302. (Reported by May V. Seagoe, Ph.D., Professor and Associate Dean, University of California at Los Angeles.)
Cooperating group(s): San Fernando Valley Juvenile Hall.
Publication: Dissertation and possible publication.

20-JM-3 VALUES OF GANG DELINQUENTS

Purpose: To test hypothesis that values of delinquent gang boys concerning such middle class activities as getting good grades in school, saving money, and reading good books, are not different from those of middle class boys, despite wide difference in overt behavior.
Methods: Detached workers are asked to guess how gang boys would value middle class activities; gang boys are asked to report values of their friends, rather than themselves; gang boys are placed in an Asch-type small group experiment wherein a high-status peer derogates middle class behavior and praises gang behavior--responses of remaining boys are then recorded; values of gang boys as a function of I.Q. and age are examined to see whether they conform to same patterns as do control groups. Appropriate control groups are present in each case.
Duration: Not reported-June 1967.
Investigator(s): Robert A. Gordon, Ph.D., Assistant Professor of Social Relations, Johns Hopkins University, Baltimore, Md. 21218.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-JM-4 THE INTERRELATIONSHIP OF VARIABLES AMONG JUVENILE DELINQUENTS

Purpose: To examine the interrelationship among a large number of variables for a group of institutionalized, delinquent adolescents.
Subjects: 300 boys and 112 girls, admissions to the Utah State Industrial School.

Methods: Use of a biographical inventory consisting of 155 items of information about family background, offenses, and a variety of other social and personal data. Data are gathered from past records, interviews with subjects, and sometimes, with their parents. Variables under study are analyzed by computer and cross-tabulated and intercorrelated, with significant and nonsignificant correlations presented for boys and girls. A factor analysis for variables is scaled in an interval manner to examine whether common relationships exist among the items.
Investigator(s): Harold C. Nielson, Ph.D., Chief, Psychology Research, Veterans Administration Hospital, 16111 Plummer, Sepulveda, Calif.; and Richard C. Sowles, M.S., Chief Psychologist, Utah State Industrial School, Ogden, and University of Utah, Salt Lake City, Utah.
Cooperating group(s): Veterans Administration.

20-JM-5 A STUDY OF THE SUSCEPTIBILITY TO INFLUENCE OF TWO TYPES OF INSTITUTIONALIZED FEMALE DELINQUENTS AS A FUNCTION OF PEER AND ADULT PRESSURE

Purpose: To investigate some behavioral differences between social and neurotic delinquents; to test hypothesis that social delinquents would be more responsive to peer conformity pressures while neurotic delinquents would be more susceptible to adult influence.
Subjects: 150 girls at Wisconsin School for Girls, equated for age, I. Q., racial background, and length of institutionalization.
Methods: Equal numbers of neurotic and social delinquent subjects are randomly assigned to each of the four different experimental treatment conditions, each of which defines a different reference group: (1) an institutional staff adult group; (2) a noninstitutional adult group; (3) a delinquent peer group; (4) a nondelinquent peer group. Three female confederates are used for each condition to give predetermined responses in order to influence the subject's responses in certain ways. Conformity behavior is assessed by two different kinds of behavioral tasks. Prior to any experimental treatment, a measure of each subject's self-esteem was obtained through use of a questionnaire, as conformity and self-esteem seem to be significantly related.
Duration: April 1964-continuing.
Investigator(s): James W. Lewis, Ph.D., and S. E. Feldman, Clinical Services, Wisconsin State Prison, Waupun, Wis. (Reported by NCCD.)
Cooperating group(s): Bureau of Research, Wisconsin Division of Corrections.

20-JM-6 A STUDY OF THE CRIMINALITY OF FEMALE OFFENDERS, FOURTEEN TO EIGHTEEN YEARS OF AGE, IN THE DISTRICT OF LANDGERICHT AT WUPPERTAL, GERMANY, IN 1942-1952

Purpose: To investigate the criminality of female delinquents; to relate trends in this criminality to events happening during the period; and to investigate the intellectual influences affecting laws dealing with youthful female offenders.
Subjects: 1,349 girls, ages 14 to 18.
Methods: Study of incidence of each type of offense and quality of offenses. Investigation into family environment, social background, education, occupation, recreation, motivation, age, and type of each offender.
Findings: In years immediately following World War II, offenses against property were more numerous, but a trend toward dangerous crimes against the person developed. There was also an increase in sex offenses and false accusations. Most subjects were only occasional and casual criminals, motivated by avarice, need for self-assertion, and a search for

thrills. One out of six came from an asocial environment; two out of five came from broken homes; half were school dropouts. Legal punishment became less severe as the years progressed, and there was more emphasis on rehabilitation and education.

Duration: Completed in 1964.

Investigator(s): Dr. Harald Jaeger, Criminological Seminar, Faculty of Law, University of Bonn, Bonn, Germany. (Reported by NCCD.)

20-JM-7 RELATED INCONGRUENCE AND ANXIETY SCALE

Purpose: To specify what kinds of incongruent perceptions are related to anxiety and the nature of the relationship; to lay groundwork for the development of a psychometric instrument to aid in pinpointing the sources of a person's anxiety.

Subjects: 50 consecutively admitted male delinquents at Wisconsin School for Boys, Wales.

Methods: Two questionnaires were administered and the resulting scores correlated. The first is the IPAT Anxiety Scale, a factor-analyzed instrument designed to determine subject's level of "free-floating" anxiety. Second is a set of rating scales in which items likely to be of central emotional importance to the subject (happiness, sadness, mother, father, sex, job, etc.) are rated on two dimensions of value (good-bad) and power (strong-weak). Incongruence score is derived by finding extent to which power ratings exceed value ratings. Basic hypothesis is that an individual who rates emotionally important things as more powerful than good is a more anxious individual.

Duration: August 1964-September 1965.

Investigator(s): James E. Cowden, Ph.D., Research Psychologist, Clinical Services, Division of Corrections, and Paul H. Kusuda, M.A., Social Science Research Analyst, Bureau of Research and Statistics, State Department of Public Welfare, Madison, Wis. 53702. (Reported by NCCD.)

Cooperating group(s): Wisconsin School for Boys, Wales.

20-JM-8 AN ANALYSIS OF THE RELATIONSHIP BETWEEN AGGRESSIVE FANTASY AND BEHAVIOR IN INSTITUTIONALIZED DELINQUENTS

Purpose: To assess the degree and direction of the relationship between types of fantasy activity, personality traits, and delinquent behavior, particularly assaultive and non-assaultive delinquent behavior; to discover whether violence, as depicted in mass communications media is, as is widely believed, conducive and supportive of various kinds of delinquent behavior.

Subjects: 100 delinquent boys at Wisconsin School for Boys, Wales.

Methods: A questionnaire was administered, containing an exhaustive list of modes in which adolescents spend their spare time. Five additional factors were included which tap disciplinary factors in the delinquent's background. Results were added to counselor ratings of maturity, institutional adjustment, adequacy of the boy's relationship with counselor and peers, and degree of passivity. Ratings were made from Clinical Services reports with regard to degree of susceptibility to particularly destructive and/or assaultive delinquent behavior as engendered by mass communications media. Correlations were then made to determine whether or not boys who have a more serious or extensive history of delinquent behavior spend more time involved in aggressive fantasies than do boys with a relatively less serious or extensive delinquent history.

Duration: January-September 1965.

Investigator(s): Thomas Bassett, Ph.D., Chief Psychologist, and James E.

Cowden, Ph.D., Research Psychologist, Clinical Services, Division of Corrections, State Department of Public Welfare, Madison, Wis. 53702. (Reported by NCCD.)
Cooperating group(s): Wisconsin School for Boys, Wales.

20-JM-9 RESOURCE SELECTION BY INSTITUTIONALIZED DELINQUENT GIRLS FOR DISCUSSION OF PROBLEMS

Purpose: To determine with whom an institutionalized delinquent girl discusses specific problems, personal, social, and physical; to test hypotheses that (1) subjects will select peers as a resource with whom they can discuss personal problems; (2) subjects will select institutional staff members as a resource with whom they can discuss social problems; and (3) subjects will select no one with whom they can talk about matters of sex-knowledge accretion.
Subjects: 60 girls randomly drawn from three age-group cottages at Wisconsin School for Girls, Oregon.
Methods: Subjects were tested in groups of five. A questionnaire was administered consisting of 45 questions covering the three problem areas. Comparative frequency of each problem area was checked and tabulated as it related to resource, age, and cottage.
Duration: October 1964-June 1965.
Investigator(s): Arthur P. Miles, Ph.D., Professor of Social Work, University of Wisconsin; and Paul H. Kusuda, M.A., Social Science Research Analyst, Bureau of Research and Statistics, State Department of Public Welfare, Madison, Wis. 53702. (Reported by NCCD.)

20-JM-10 A STUDY OF CHARACTERISTICS OF MALE CALIFORNIA YOUTH AUTHORITY WARDS AS A FUNCTION OF THE TYPE OF COMMITMENT OFFENSE

Purpose: To study characteristics of male California Youth Authority wards as a function of the type of commitment offense.
Subjects: Male wards admitted to the Youth Authority for the first time, in 1961 and 1963.
Methods: Background data were obtained from parole agents' Initial Home Visit Interview Schedule and clinic summaries prepared at the reception center through which the ward was processed. Statistical analysis of each of the many variables was made using Chi-square tests of statistical significance. Initial comparisons were made between wards committed for assaultive offenses (homicide, assault to commit a felony, attempted murder, all other assaults, battery, forcible rape, and attempted rape) and wards committed for all other offenses. Comparisons were also made between assaultive offenders and specific other offender groups such as burglars, robbers, sex offenders, and narcotic offenders. Comparisons will also be made between other specific offender groups.
Findings: The following variables significantly differentiated (at the .05 level or better) assaultive from all other offenders in both samples: race, prior delinquent record, alcohol use, narcotics use, attitude toward school, age at which truancy began, history of nail biting, judgments of emotional ties of the father figure to the ward, and judgments of family cohesiveness. Wards committed for assaultive offenses were generally statistically over-represented in the more positive categories of most of these variables, e.g., less extensive delinquent history, more accepting attitude toward school, and more family cohesiveness.
Duration: Completed in 1965.
Investigator(s): Martin J. Molof, Ph.D., Associate Social Research

Analyst, Division of Research, California Youth Authority, State Office Building No. 1, Sacramento, Calif. 95814. (Reported by NCCD.)
Publication: Final report by California Youth Authority.

20-JV-1 BARBITURATE, AMPHETAMINE, MARIJUANA, AND LSD TREATMENT PROJECT (BANBAM PROJECT)

Purpose: To develop and test a treatment methodology for effecting abstinence and concomitant productive values and behavior among youthful "soft drug" abusers.
Subjects: About 50 youthful abusers of barbiturates, amphetamine, marijuana, and LSD, as well as glue sniffers, who are on probation or parole or who voluntarily appear at the clinic for treatment.
Methods: "Reality Therapy" as described by Glasser (1965) and implemented by the procedures of Dayton Village, a therapeutic community for drug addicts on Staten Island (Shelly and Bassin, 1964, 1965), is applied on an outpatient basis at the Civic Center Clinic in Brooklyn. Groups are formed which engage in free verbal exchanges under an indigenous leader trained for this project. Professional aides are also involved to provide positive experiences with representatives of the larger society.
Findings: It is felt that an effective technology for treatment of the BAM-LSD population has been created.
Duration: November 1965-November 1970.
Investigator(s): Alexander Bassin, Ph.D., Director of Group Therapy, and Ralph S. Banay, M.D., Medical Director, Civic Center Clinic, 44 Willoughby St., Brooklyn, N. Y.
Cooperating group(s): New York Foundation.
Publication: Two professional papers anticipated in 1967.

20-JV-2 THERAPEUTIC AND LIVING-LEARNING EXPERIENCES FOR CHILDREN WHO ARE HABITUATED TO GLUE-SNIFFING

Purpose: To provide therapeutic counseling for juvenile glue-sniffers.
Subjects: Children who habitually inhale the fumes of model airplane glue and rubber cement, and who have come to the attention of the Juvenile Court.
Methods: Subjects receive intensive or individual counseling and activity planning. Groups are based in neighborhood community centers. Coordinated with these activities are experimental educational instruction and intensive parent involvement. Boys are evaluated medically, psychologically, and sociometrically.
Duration: July 1965-December 1966.
Investigator(s): Judge Ted Rubin and Lester G. Thomas, Denver Juvenile Court, Room 166, City and County Building, Denver, Colo. 80202. (Reported by NCCD.)
Cooperating group(s): Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

20-JV-3 A LONGITUDINAL STUDY OF MARIJUANA AND DANGEROUS DRUG USERS

Purpose: To determine extent of marijuana and dangerous drug use among juveniles as measured by police arrests in a particular jurisdiction; to learn whether there necessarily is a progression from use of marijuana or

dangerous drugs to heroin and other opiate substances; to study interrelationships between a delinquent orientation and marijuana or drug use; to determine characteristics of the users, and pattern of delinquent or criminal activity following a first time arrest for this offense.
Subjects: A cohort of juveniles arrested by the Los Angeles Police Department in 1961 for first time use of marijuana or dangerous drugs.
Methods: Narcotic arrest history of the cohort over a three- to four-year period will be analyzed to determine progression of delinquent and/or criminal behavior. Sociological and case history information is gathered, and interviews are held with as many of the cohort group as can be located.
Duration: 1964-continuing.
Investigator(s): George F. Davis, M.A., Senior Social Research Analyst, Division of Research, California Youth Authority, State Office Building No. 1, Sacramento, Calif. 95814. (Reported by NCCD.)
Cooperating group(s): Bureau of Criminal Statistics, California Department of Justice; Los Angeles Police Department.

20-JY-1 PREVENTIVE INTERVENTION IN ALCOHOL-RELATED CONDITIONS

Purpose: To study the natural history of development of alcoholism in a group of adolescents assumed to be high risks for subsequent development of alcohol pathology; namely, a group of boys whose delinquent behavior is related to use of alcohol.
Subjects: 250 males aged 14 to 16 divided into five groups of 50 each: (1) alcohol-related delinquents evaluated and treated; (2) alcohol-related delinquents evaluated but not treated; (3) alcohol-related delinquents identified but not evaluated or treated until follow-up; (4) nondelinquents; (5) non-alcohol-related delinquents.
Methods: Each subject who is evaluated is given a standard psychiatric examination. In addition, a variety of tests are administered in order to assess the multilevel functioning of dependency as a need state and as a behavior. All measures are related to the developing theory of delinquency that centers around dependency needs. Special treatment methods are being developed for that group of boys with whom intervention is taking place.
Duration: September 1964-August 1969.
Investigator(s): Morris E. Chafetz, M.D., Director, Alcohol Clinic and Acute Psychiatric Service, Massachusetts General Hospital, Boston, Mass.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Results will be published in related professional journals.

20-JY-2 A STUDY OF THE INCIDENCE OF CRIMINAL BEHAVIOR FOLLOWING DISCHARGE FROM THE CALIFORNIA YOUTH AUTHORITY AND ITS RELATIONSHIP TO PREDISCHARGE FACTORS

Purpose: To follow community adjustment of Youth Authority wards after discharge in terms of recorded legal dispositions of police bookings; to attempt to find out if a relationship exists between evaluation at discharge and the ward's official record while with the Youth Authority and later adjustment as measured by these recorded legal dispositions of bookings; to determine length of follow-up necessary to identify any desired percent of lawbreakers within a ten-year period.
Subjects: 4,000 Youth Authority wards discharged in 1953 and 1958.
Methods: Arrest records were obtained, and dispositions of police bookings were recorded on a form which already contained the ward's Youth Authority record. Data are machine processed and analyzed.
Duration: January 1964-continuing.

Investigator(s): Evelyn S. Guttmann (formerly) Assistant Social Research Analyst, and Carolyn B. Jamison, Junior Social Research Analyst, Division of Research, California Youth Authority, State Office Building No. 1, Sacramento, Calif. 95814. (Reported by NCCD.)

20-KA-1 RELATION OF SOCIAL CLASS AND TYPES OF DELINQUENCY

Purpose: To explore distribution of three kinds of delinquency--attacks against persons, vandalism, and theft in various socio-economic ranks; to explore relative importance of causal variables of delinquent peer groups, inadequate role models, and indeterminacy of status in producing each kind of delinquency; and to compare self-reported and official rates of delinquency for various school districts.
Methods: Anonymous questionnaires are answered by high school sophomores in communities of various sizes, eliciting responses about face data, including father's occupation as an indicator of socio-economic position, three variables thought to be delinquency producing, and three kinds of delinquent behavior.
Duration: April 1964-June 1967.
Investigator(s): William R. Arnold, Ph.D., Assistant Professor of Sociology, University of Texas, Austin, Tex. 78712.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-KA-2 ETIOLOGY OF THEFTS BY BOYS UNDER SIXTEEN YEARS OF AGE

Purpose: To discover what factors in the personal lives of juvenile thieves made them commit theft rather than another crime or no crime at all.
Subjects: The 70 cases of theft seen by the Juvenile Court Judges at Mons, Belgium in 1964.
Methods: Pre-sentence investigations into personal lives of subjects.
Duration: October 1964-October 1965.
Investigator(s): Paul Lesire, Institut d'Etudes Sociales de l'Etat, 31, Ave. Reine Astrid, Mons, Belgium. (Reported by NCCD.)

20-KA-3 URBANIZATION AND MALE DELINQUENCY IN GHANA, WEST AFRICA

Purpose: To study specific effects of the urbanization process upon male delinquency in the rapidly developing society of Ghana; to test hypotheses that (1) disorganization resulting from urbanization affects the city, adjacent villages, and villages from which the people migrate; (2) delinquent behavior represents a mode of adaptation to urban living by lower class youth who have become alienated from the family and the school system and who, in a marginal social position, turn to deviant peers for guidance.
Subjects: 107 male offenders who had committed crimes against property and who were incarcerated in the Remand School, Accra.
Methods: Interviews; analysis of records; comparison of histories with 95 male students in primary and middle schools in and near Accra. Investigators also visited slum areas and consulted adult Ghanaians on effect of urbanization on family, school, and means of social control.
Findings: Urbanization causes disorganization in family, school system, and local community, and this influences the youth and contributes to

879

their recourse to delinquency.
Duration: March 1961-April 1965.
Investigator(s): S. Kirson Weinberg, Ph.D., Chairman, Department of Sociology and Anthropology, Roosevelt University, 430 S. Michigan Ave., Chicago, Ill. 60605. (Reported by NCCD.)
Cooperating group(s): University of Ghana.

20-KA-4 A STUDY OF MALE AND FEMALE DELINQUENTS IN GHANA, WEST AFRICA

Purpose: To compare family background, school behavior, and peer relations of male and female delinquents in Ghana.
Subjects: 107 males and 67 females.
Methods: Review of records of the Remand Home and the Girl's School, and interviews with a large proportion of the inmates.
Findings: Female delinquents emerged from more disorganized families than did male delinquents.
Duration: March 1961-September 1965.
Investigator(s): S. Kirson Weinberg, Ph.D., Chairman, Department of Sociology and Anthropology, Roosevelt University, 430 S. Michigan Ave., Chicago, Ill. 60605. (Reported by NCCD.)
Cooperating group(s): University of Ghana; Accra Department of Welfare, Ghana.

20-KD-1 TREATED AND UNTREATED DELINQUENTS -- FOLLOW-UP

Purpose: To follow up boys in the interference group in seventh grade of eight junior high schools serving high delinquency areas in Columbus, Ohio.
Subjects: Seventh grade boys in Columbus junior high schools.
Methods: Subjects had been given a presentation of models of behavior to strengthen self-image on theory that a stronger self-image could inoculate them against future delinquency. Interference cohort and two control group cohorts covering 1963-64, 1964-65, and 1965-66 will be cleared through school records and records of juvenile bureau of police department to arrive at any differential showing in school performance and delinquency involvement. Study will also determine differential dropout of several cohorts after 16th birthday.
Findings: Incomplete data indicate that treated boys are involved in less serious offenses than untreated boys and show greater improvement in reading and school attendance.
Duration: September 1963-September 1970.
Investigator(s): Walter C. Reckless, Ph.D., and Simon Dinitz, Ph.D., Professors, Ohio State University, Columbus 10, Ohio.
Cooperating group(s): Columbus public schools; Franklin County Juvenile Court; Columbus Police Department.
Publication: Monograph planned in 1970.

20-KD-2 STUDY OF DELINQUENT GANGS

Purpose: To measure the impact of a "detached worker" program on four large clusters of Negro juvenile gangs in Southwest Los Angeles.
Methods: Research observation; daily process and contact records from gang workers; police and probation records gathered over four-year period.
Duration: July 1961-July 1966.

Investigator(s): Malcolm W. Klein, Ph.D., Youth Studies Center, University of Southern California, Los Angeles, Calif. 90007.
Cooperating group(s): Delinquency Prevention Service of the Los Angeles County Probation Department; Ford Foundation.

20-KD-3 CENTER FOR TRAINING DELINQUENT AND PRE-DELINQUENT YOUTH IN DELINQUENCY CONTROL

Purpose: To prepare delinquent and pre-delinquent youth for leadership in their local communities and in the control and prevention of juvenile delinquency among their groups, clubs, gangs, and other associations.
Subjects: Delinquent and pre-delinquent youth from Brooklyn recruited for a summer teen work camp.
Methods: The total experience in camp -- planning sessions; work; program; conflicts; relationships with adults, trainees, and other teen campers; evaluations; conferences; teen government -- is designed to change the direction of the energy output. All experiences and relationships are consciously directed toward angling this change through skill, consistency and integrity in examining the richness of difference, the freedom and responsibility involved in decisions between alternative choices, the goals and identity of youth and the adult society. The test of the curriculum is the internal consistency with the living experience of the teen work camp. Training will continue, at close of camp, at the United Community Centers, Inc., Brooklyn.
Duration: July 1965-June 1966.
Investigator(s): Morris L. Eisenstein, Harold Bardonille, and Fannie P. Eisenstein, United Community Centers, Inc., 819 Van Siclen Ave., Brooklyn, N. Y. (Reported by NCCD.)
Cooperating group(s): Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

20-KD-4 A STRATEGY FOR CURBING DELINQUENCY IN A NEGRO NEIGHBORHOOD

Purpose: To bring about a lessening of delinquent behavior by providing fatherless boys identification with a socially acceptable adult male; to increase effectiveness of the maternal figure as a positive factor in the life of the boy; to increase the strength of the family involved; to aid the neighborhood in organizing a Neighborhood Council which will be responsible for initiating projects to control and prevent delinquency; and to teach work skills.
Subjects: 60 youths in conflict with the authority of the law, schools, or parents, and living in a section of Charleston in which fifty percent of the children live in one-parent matrifocal families. Area has greatest incidence of juvenile delinquency in Charleston.
Methods: A clinical psychologist, social group worker, and community action technician will select and train fifteen stable men of the neighborhood to work as surrogate parents with subjects.
Duration: September 1965-August 1968.
Investigator(s): Sister Mary Anthony, Our Lady of Mercy Welfare Center, 77 American St., Charleston, S. C. 29403. (Reported by NCCD.)
Cooperating group(s): Catholic Charities of the Diocese of Charleston; Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

20-KD-5 THE SOUTH BROOKLYN YOUTH LEADERSHIP PROJECT

Purpose: To reduce juvenile delinquency by reducing inter-group conflict; to improve inter-group relations; to provide meaningful group activities that cut across ethnic barriers and provide hitherto non-existent opportunities for inter-group contact.
Subjects: Teenagers in South Brooklyn.
Methods: Leaders of activities are selected from the informal leadership of the older teenagers. They are trained in recreational and inter-group skills and are paid for their work. Composition and orientation are inter-ethnic. Focus of groups is on shared activities rather than improved inter-group relations that is the desired outcome. Activities are planned to involve parents of the children and peers of the leaders in inter-group experiences in the hope that such experience will provide the basis of cooperative endeavor among both adults and adolescents to improve and integrate their community. Evaluation of initial summer experiences will be in terms of inter-group contacts and consequences. Natural groupings will be described and observed for incidents and change (if any) as a result of interaction with members of other ethnic groups.
Duration: Reported February 1966.
Investigator(s): Susan Harwig, Assistant Boro Community Coordinator, and Judith R. Kramer, New York City Youth Board, 210 Joralemon St., Rm. 1101, Brooklyn, N. Y. 11201. (Reported by NCCD.)
Cooperating group(s): South Brooklyn Improvement Council; Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

20-KG-1 POLICE DECISION-MAKING WITH JUVENILES

Purpose: To determine criteria used by police officers when in process of exercising their discretion as to how to dispose of apprehended juvenile offenders.
Subjects: All juvenile offenders contacted by the Detroit Police Department Youth Bureau between the years 1952 and 1961, consisting of some 26,464 boys between 10 and 16 years of age who have some 59,759 contacts with the police.
Methods: Correlates of disposition decisions with analysis by 7094 computer.
Duration: February 1965-June 1966.
Investigator(s): David J. Bordua, Ph.D., Associate Professor of Sociology, University of Illinois, Urbana, Ill. (Reported by James W. Harris, Ph.D. Candidate, Department of Sociology, University of Illinois.)

20-KG-2 A STUDY OF FOUR CASES OF UNGOVERNABLE PRE-ADOLESCENTS HANDLED BY THE JUVENILE COURT

Purpose: To evaluate relationships between the social worker, the children, and their parents in order to rehabilitate the boys.
Subjects: Four ungovernable pre-adolescents randomly selected from among cases handled by the Juvenile Court; (cases referred to the court through complaints filed by the parents.)
Methods: Psychological study of the personality and family milieu of the children; study of court records; interviews with parents and children.
Duration: October 1963-October 1964.
Investigator(s): Jacqueline Maison, and Annie Culot, Professor, Institut d'Etudes Sociales de l'Etat, 31, Ave. Reine Astrid, Mons, Belgium.

(Reported by NCCD.)
Cooperating group(s): Juvenile Court, Mons, Belgium.

20-KG-3 A STUDY OF FAMILIES WHO HAVE LOST PARENTAL RIGHTS DUE TO COURT CONTACT

Purpose: To study factors leading to loss of parental rights.
Subjects: Families living in Anvers, Belgium, who came to the attention of the court in 1957, 1958, and 1959.
Methods: Data derived from social observation of families who had lost parental rights were compared with data derived from social observation of families who had no loss of parental rights.
Findings: The assistance of a social worker prior to court contact was a major factor in enabling a family to retain its parental rights. Many more families lost parental rights than retained them, an indication of the need for expanded social work assistance to families prior to court contact.
Duration: October 1964-July 1965.
Investigator(s): Beatrice Van Peel, Division of Child Welfare, Belgian Ministry of Justice, Anvers, Belgium. (Reported by NCCD.)
Cooperating group(s): School of Social Work, Anvers.

20-KG-4 INTENSIVE SUPERVISION UNIT RESEARCH PROJECT

Purpose: To evaluate effectiveness of an intensive supervision unit in New York City offering casework services to boys on parole to the New York State Training School System, during a three-year period.
Subjects: Approximately 200 youngsters ages 14 to 17.
Methods: The caseloads numbered between 20 and 30 boys. Experimental subjects and control groups of typical parolees are compared on a number of variables. Data are obtained through a field survey including use of selective questionnaires and interviews. Appropriate statistical analysis is applied to obtain information on (1) process of selecting youngsters for the unit, (2) nature of services provided to unit youngsters and their families, and (3) relationship of (1) and (2) to final case disposition for the population groups.
Duration: July 1965-continuing.
Investigator(s): Dr. Harry Posman, Director, Social Research, New York State Department of Social Welfare, 112 State St., Albany, N. Y. (Reported by NCCD.)

20-KG-5 AN INITIAL HOME VISIT RESEARCH SCHEDULE COMPARISON OF MALE AND FEMALE CALIFORNIA YOUTH AUTHORITY WARDS

Purpose: To compare Youth Authority wards of both sexes in terms of the variables of the Initial Home Visit Research Schedule; to report any differential parole performance between the sexes with respect to the different variables.
Subjects: Four combined admission cohorts (1960-1963), and 1962 parole release cohorts.
Methods: Percent distributions by categories of each of the IHV variables were obtained. Parole performance data were obtained from 1961 and 1962 parole release cohorts.
Findings: In general, girls appear to have less favorable home and background situations than boys.

883

Duration: Completed in 1965.
Investigator(s): Evelyn S. Guttmann (formerly) Assistant Social Research Analyst, Division of Research, California Youth Authority, State Office Building No. 1, Sacramento, Calif. 95814. (Reported by NCCD.)
Publication: Full report published by California Youth Authority.

20-KG-6 THE MARSHALL PROJECT: ASSESSMENT OF A THERAPEUTIC LIVING UNIT AT A CALIFORNIA YOUTH AUTHORITY RECEPTION CENTER

Purpose: To assess the parole adjustment of wards released from the Marshall Program as compared to that of releasees from other Youth Authority Programs; to ascertain what types of wards, as defined by socio-psychological characteristics, tend to benefit from a program of short-term residential treatment; to identify factors in the treatment process which have a significant impact upon the post-release adjustment of wards.
Subjects: Wards admitted to the Southern Reception Center-Clinic and meeting the following criteria: (1) first admission to the Youth Authority, (2) 15 to 17-1/2 years old, (3) home residence within 90 miles of the Reception Center-Clinic, (4) no evidence of serious emotional disturbance or of need for psychiatric treatment in the institution, (5) no commitment offense which is so serious as to require a stay in a Youth Authority institution for a period longer than 90 days, (6) ineligible for direct release to parole, (7) no extensive history of drug usage, sexual deviation, serious assaultive behavior, or high escape potential, and (8) willingness of parents to attend counseling sessions.
Methods: Subjects stay for 90 days and participate in a half-day work program, class discussions dealing with problems of parole adjustment, small group sessions and daily living unit meetings, and opportunities to go home on week-end passes for progressively longer periods. Counseling sessions for parents are led by Marshall Program social workers. Panel interviews are employed to focus on manifest changes in self-concepts and interpersonal relations and to estimate to what extent boys are accepting values and goals stressed in the Program. The Jesness Inventory and an impact questionnaire are administered on a pre- and post-test basis to tap group differences and individual changes in orientation toward self, peers, staff, program, and prospects for adjustment on parole. Rating scales are applied to secure staff evaluations as to level and degree of involvement of wards in major treatment activities -- counseling sessions, living unit, school, work, and pass programs. A series of sociometric tests are administered every six weeks to all wards in the program. Information on post-release adjustment is maintained on wards paroled from the Program and on those paroled from regular institutions as control subjects. A record is kept of parole violations as well as qualitative adjustment in the community in areas of school, employment, and extent of association with delinquent peers. It is planned to follow each ward 15 months after release from the institution.
Duration: November 1964-continuing.
Investigator(s): Joachim P. Seckel, M.A., and Chester F. Roberts, M.A., Associate Social Research Analysts, Division of Research, California Youth Authority, State Office Building No. 1, Sacramento, Calif. 95814. (Reported by NCCD.)

20-KG-7 ASSESSMENT OF THE FREMONT PROJECT: A THERAPEUTIC LIVING UNIT

Purpose: To compare the regular institutional program and the work-therapy program of the Fremont unit at the Southern Reception Center-Clinic of the

California Youth Authority to assess the quality of parole adjustment associated with each.
Subjects: Wards entering the Southern Reception Center-Clinic and meeting following criteria for eligibility: (1) minimum age of 16, (2) minimum academic achievement level of 7.0, (3) evidence of willingness to accept work responsibility, (4) capacity to participate positively in group living and to respond to influence of the group, (5) no extensive history of running away, use of drugs, sexual deviation, or serious assaultive behavior.
Methods: Eligibles were assigned randomly to Fremont and to regular institutions. The Fremont program involved a supervised work program, an academic program, and a combination of individual therapy, group therapy, and living-unit meetings. To foster a broader understanding of the outside community, Fremont wards were taken on trips to junior colleges, industrial plants, and other places of cultural interest, as well as to places of recreation. Following release from Fremont and from the regular program, the two cohorts have been compared periodically on parole performance. Major criteria of performance are return to custody and unfavorable discharge from Youth Authority jurisdiction.
Findings: Twelve months after parole, approximately 19 percent of the 75 Fremont subjects and 20 percent of the 51 control subjects were revoked from parole.
Duration: September 1951-1965.
Investigator(s): Joachim P. Seckel, M.A., Associate Social Research Analyst, Division of Research, California Youth Authority, State Office Building No. 1, Sacramento, Calif. 95814. (Reported by NCCD.)

20-KG-8 ASSESSMENT OF THE VIOLENCE CONTROL DEMONSTRATION UNITS OF THE CALIFORNIA YOUTH AUTHORITY, DIVISION OF PAROLE

Purpose: To provide statistical descriptions of the operations of the Violence Control Demonstration Unit; to validate previously designed "workload" measures by means of time studies; to provide a content-analysis of descriptions of violent offenses that occur in the project.
Subjects: Two parole units, each supervising 200 wards.
Methods: All male wards currently on parole in designated area of San Diego and all male wards regularly released to parole in the area are included in the Violence Control Demonstration Unit. Caseloads average 30 wards per agent as compared to regular parole caseloads of 70, providing greater intensity of parole services possible for each ward. Violence Control Demonstration Unit attempts to reduce violent behavior rather than recidivism, *per se*.
Duration: November 1964-continuing.
Investigator(s): Bertram M. Johnson, A.B., Senior Social Research Analyst, Division of Research, California Youth Authority, State Office Building No. 1, Sacramento, Calif. 95814. (Reported by NCCD.)
Cooperating group(s): Division of Parole, California Youth Authority.
Publication: Yearly reports to be issued.

20-KJ-1 A STUDY OF SOCIAL SERVICES PROVIDED THE ALLEGED AND ADJUDICATED DELINQUENT CHILD BY COUNTY AGENCIES

Purpose: To identify the level of service provided the delinquent child, thereby enabling the state agency to modify its program of supervision and consultation services to these county agencies.
Subjects: 25 counties selected for study.

Methods: Record reading; interviewing; inspection; evaluation of supervision of delinquent children; and provision of intake services for the juvenile court.
Duration: November 1965-November 1966.
Investigator(s): Robert A. Ganser, M.S.S.W., Supervisor; Ozzie Stern, M.S.S.W., Consultant, Administrative Studies Unit; and Joseph Lehnen, M.S.S.W., County Services Supervisor, Division for Children and Youth, State Department of Public Welfare, Madison, Wis. 53702.

20-KM-1 THE PRESTON TYPOLOGY STUDY

Purpose: To explore the usefulness of a delinquency typology in a California Youth Authority institution.
Subjects: Delinquent boys from 15 to 18 years of age, committed to the California Youth Authority and assigned to the Preston School of Industry, Ione, Calif.
Methods: Interviews and psychological inventories serve as primary tools for classifying boys into one of six subtypes (derived from the Interpersonal Maturity Classification System). Once classified, boys are assigned to an experimental living unit where a unique treatment milieu is established. An evaluation of outcomes, through tests, behavior reports and recidivism rates, will be compared between subtypes who have lived in experimental units with specific typology-related treatment and subjects of the same subtype assigned to a "regular" non-homogeneous control unit.
Duration: September 1965-March 1968.
Investigator(s): Carl F. Jesness, Ph.D., Senior Behavioral Research Analyst, Division of Research, California Youth Authority, State Office Building No. 1, Sacramento, Calif. 95814.
Cooperating group(s): Institute of the Study of Crime and Delinquency; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-KM-2 DIFFERENTIAL TREATMENT ENVIRONMENTS FOR DELINQUENTS (DTED) PROJECT

Purpose: To determine feasibility of establishing five types of group homes--with each of the five representing a type of environment specific to growth and development needs of particular types of delinquent youth; to develop a taxonomy of treatment environments; and to evaluate impact of group home experience on children assigned to them.
Subjects: Male Juvenile Court commitments to the California Youth Authority, aged 13 through 19, who serve as.experimental subjects within the Youth Authority's Community Treatment Project.
Methods: Tentative, theoretical descriptions of the five types of group homes (protective, containment, boarding, temporary community care, and short term restriction) have been developed from prior foster home experience with the nine subtypes of delinquents identified by the Interpersonal Maturity Level classification used in the Community Treatment Project. Based upon this system of classification, youths are assigned to their particular, theoretically appropriate group home placement as part of their regular, initial staffing procedure. Placement into each of these homes is planned rather than based upon random assignment. Descriptive and evaluative research data are collected in two major areas: (1) characteristics of study subjects, and changes in these characteristics during course of program, and (2) characteristics of and changes through time within the five environments (including the group home parents) being developed. A variety of psychometric, observational, and personal inter-

view techniques and instruments are utilized.
Duration: April 1966-March 1969.
Investigator(s): Theodore B. Palmer, Ph.D., Principal Investigator, DTED Project and Co-investigator, Community Treatment Project; and Doyle L. Roberts, M.A., Supervisor of Community Treatment Project and Co-investigator of DTED Project, Division of Research, California Youth Authority, State Office Building No. 1, Sacramento, Calif. 95814.
Cooperating group(s): State of California; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Progress reports; reports in professional journals.

20-KM-3 THE INSTITUTIONAL MANAGEMENT OF ISLAM'S APPEAL TO LOW-STATUS DELINQUENT BOYS

Purpose: To achieve a rational management policy based on clinical evaluation of the Brother Movement among adolescent Puerto Rican and Negro boys.
Subjects: 14- and 15-year old delinquents committed to a state training school.
Methods: I.E.S. test and Cattell H.S.P.Q. administered to White, Puerto Rican, and Negro boys, "brothers" and non-"brothers."
Duration: November 1965-spring 1967.
Investigator(s): Daniel P. Clarke (D.P.A. Candidate, State University of New York), Senior Clinical Psychologist, Warwick State Training School for Boys, Warwick, N. Y. 10990.
Cooperating group(s): Graduate School of Public Affairs, State University of New York.

20-KM-4 STUDY OF THE POSSIBILITIES FOR SUCCESSFUL SOCIAL INTEGRATION OF YOUNG FEMALE DELINQUENTS

Purpose: To determine optimum treatment for delinquent girls individually and as a group; to learn which criteria were most influential in determining type of treatment.
Subjects: 30 delinquent girls placed in a training school by a juvenile court.
Methods: Investigation of court record, institutional behavior, family and home environment.
Duration: October 1964-October 1965.
Investigator(s): Bernadette Demay, Institut d'Etudes Sociales de l'Etat, 31, Ave. Reine Astrid, Mons, Belgium. (Reported by NCCD.)
Cooperating group(s): Children's Department, Belgium.

20-KM-5 CONTINGENCIES APPLICABLE TO SPECIAL EDUCATION (CASE)

Purpose: To utilize events or situations that can initiate, maintain, and increase or decrease behaviors, to increase the educational performance of student-inmates.
Subjects: Student-inmates at National Training School for Boys, randomly assigned to CASE.
Methods: Subject matter and schedules are rearranged based on individual or group performance requirements, and certain areas of reinforcement

normally operating in non-academic environments (a lounge with amusement machines, etc.) will be used as contingencies to increase motivation. CASE will also hold a weekly seminar and training lab sessions with the correctional officers and teachers.
Duration: Reported September 1965.
Investigator(s): Harold L. Cohen, Director, Institute for Behavioral Research, Inc., 2426 Linden Lane, Silver Spring, Md. (Reported by NCCD.)
Cooperating group(s): National Training School for Boys, District of Columbia; Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

20-KM-6 THE SAM A. LEWISOHN START CENTER AFTERCARE TREATMENT PROJECT

Purpose: To determine whether (1) continuity of care is more effective than segmented services; (2) it is feasible to use ex-offenders as an adjunct to professional staff; (3) there is any therapeutic value in using an ex-offender as an adjunct to professional staff.
Subjects: Boys in residence at Sam A. Lewisohn START Center.
Methods: A full-time aftercare director establishes contact and relationships with the boys soon after their admission to the Center, gains their confidence, and becomes familiar with treatment approaches initiated at the Center. He maintains this relationship after the boy leaves the START Center. Recent graduates of the Center are hired to work under the supervision of the aftercare director both in the residential facility and in the communities to which other graduates are returned after release from the Center. Workers sensitize and alert aftercare director to community adjustment of other graduates, and thus, to real effects of the treatment program. Workers are trained in interviewing skills, selected observations, report writing, and utilization of community resources. This aspect of the project seeks to destroy cultural and attitudinal barriers between treatment staff and delinquent youths. Analysis and evaluation of project and techniques are carried out.
Duration: May 1964-May 1966.
Investigator(s): Wilson Gonzalez, New York State Division for Youth, 155 Washington Ave., Albany; and Daniel P. Clarke, M.A., Senior Clinical Psychologist, Warwick State Training School for Boys, Warwick, N. Y. 10990. (Reported by NCCD.)
Cooperating group(s): The New York Foundation; The New York State Division for Youth.

20-KM-7 A COMPARATIVE ANALYSIS OF THE SIXTEEN PERSONALITY FACTOR TEST VERSUS THE MINNESOTA COUNSELING INVENTORY IN PREDICTING THE INSTITUTIONAL ADJUSTMENT OF DELINQUENT BOYS

Purpose: To compare the Sixteen Personality Factor Test and the Minnesota Counseling Inventory in terms of their relative efficiency as predictors of institutional adjustment and in terms of their ability to successfully differentiate among subtypes of institutionalized delinquents.
Subjects: 150 consecutively admitted delinquent boys at Wisconsin School for Boys, Wales, from October through December 1964.
Methods: Both tests were administered and results compared with various external criteria, i.e., counselor ratings of maturity, institutional adjustment, and adequacy of boys' relationships with counselors and peers. Results were also compared with clinical services prognostic ratings, as well as ratings of affective responsiveness, maturity, neurotic features, personality trait, pattern disturbances, and sociopathic features. The

relationship of scale scores on each test to the above criteria was first assessed to determine which existing scales on the two tests best predict the kinds of personality adjustment problems determined from clinical services ratings and which best predict the boys' behavior and interpersonal relationships within the institution, as determined from counselor ratings. Second, an item analysis, comparing responses of subjects on each item successively with the above criteria, was completed on each test to determine whether additional scales can be derived to predict the above criteria better than existing scales. The item analysis procedure involved deriving the scales on one-half of the subjects randomly selected out of the total group and then assessing the predictive efficiency of these scales using the other 75 subjects.
Duration: August 1964-September 1965.
Investigator(s): James E. Cowden, Ph.D., Clinical Research Psychologist, Clinical Services, Division of Corrections, and Paul H. Kusuda, M.A., Social Science Research Analyst, Bureau of Research and Statistics, State Department of Public Welfare, Madison, Wis. 53702. (Reported by NCCD.)
Cooperating group(s): Wisconsin School for Boys, Wales.

20-KM-8 AN ANALYSIS OF THE ATTITUDES AND RESPONSES OF PARENTS OF INSTITUTIONALIZED DELINQUENT GIRLS

Purpose: To analyze response patterns of parents of different types of delinquent girls, i.e., individual (neurotic) vs. social delinquents.
Subjects: Parents of 30 individual delinquents (essentially neurotic girls whose personality problems may have contributed to their delinquent behavior); 30 social delinquents (girls whose delinquent behavior is primarily related to their involvements with delinquent peers); and 30 normal controls (high school girls). Only girls who volunteered and had both parents available for testing were included in the study.
Methods: A structured situational interview was utilized to measure parental dominance, conflict, and the parents' verbalized methods of handling various situations which relate to adolescent girls. Each parent was interviewed alone, then both parents together. A standard series of situations was presented, and responses and interactions of the parents were tape-recorded and subsequently transcribed into a written record, from which operational measures of dominance and conflict were derived. A content analysis and questionnaire yielded the attitudinal measures. While one parent was being interviewed, a paper and pencil questionnaire was given to the other. This questionnaire contained revised items from the Stanford Parent Questionnaire developed by Winder and Rau. Parents were interviewed when they came to the institution to visit their daughter.
Duration: July 1964-July 1965.
Investigator(s): Mavis Hetherington, Ph.D., Associate Professor of Psychology, University of Wisconsin; Paul H. Kusuda, M.A., Social Science Research Analyst, Bureau of Research and Statistics, Wisconsin State Department of Public Welfare; and Asher R. Pacht, Ph.D., Chief, Clinical Services, Division of Correction, State Department of Public Welfare, Madison, Wis. 53702. (Reported by NCCD.)

20-KM-9 A STUDY OF THE SCHOOL ADJUSTMENT OF JUVENILE DELINQUENTS AFTER A RANCH SCHOOL EXPERIENCE

Purpose: To determine whether the work experience-remedial education rehabilitation program of the William F. James Boy's Ranch II in Santa

Clara, Calif. contributes to a positive change in the boys' achievement, punctuality, behavior, attitude, and attendance when they return to public school.
Subjects: Experimental group selected from all 13- to 15-year old male wards of the Santa Clara County Juvenile Court who were committed to the Ranch in 1961-1962, and control group, matched on eight variables, selected from same group, but who did not receive the Ranch treatment.
Methods: Two groups were compared on change in school performance during 1963-1964 school year, as compared to school performance in school year preceding the delinquent act that brought them into the study.
Findings: Composite picture of the Ranch graduate in school in 1964 shows a boy who tends to be a minor tardy problem, goes to school four or five days a week, makes "D" grades, has an improved attitude, but still must be disciplined cautiously. In terms of the vast majority of students in school, he is still a problem, but in terms of the population receiving treatment from juvenile authorities for delinquency, the Ranch seems to be a success.
Duration: March-September 1964.
Investigator(s): Duane L. Bay, 2261 Columbia, Palo Alto, Calif. 94306. (Reported by NCCD.)
Cooperating group(s): Stanford University; William F. James Boy's Ranch II, Santa Clara County, Calif.

20-KM-10 UTILIZATION OF OLDER CALIFORNIA YOUTH AUTHORITY WARDS AS AIDES FOR YOUNGER WARDS AT AN INSTITUTION

Purpose: To demonstrate the feasibility of employing selected and trained older wards in helping relationships in an institution for younger wards; to explore rehabilitative effects accruing to wards utilized as helpers and to younger wards being helped.
Subjects: Eligible youths selected from among Preston School of Industry wards, 17 to 20 years old, high school graduates, good custodial risks without prior histories of sexual misconduct or of arson, and with a minimum of four months of stay left at the institution.
Methods: Ward aides are chosen at random and trained in techniques of tutoring, officiating at various games, assisting in hobby craft activities, and generally interacting with younger wards to help them adopt more mature and non-delinquent attitudes. Feasibility will be appraised partly in terms of level of performance and skill exhibited by aides in carrying out their duties. Ability to cooperate with staff in resolving operational problems will be considered. Cost of employing and maintaining aides as compared to cost of regular institutional stay at Preston will be analyzed.
Duration: 1965-continuing.
Investigator(s): Joachim P. Seckel, M.A., and Chester F. Roberts, M.A., Associate Social Research Analysts, Division of Research, California Youth Authority, State Office Building No. 1, Sacramento, Calif. 95814. (Reported by NCCD.)

20-KM-11 A COMPARATIVE ANALYSIS OF ATTITUDES AND INTERACTIONS OF PARENTS OF MALE AND FEMALE INSTITUTIONALIZED DELINQUENTS

Purpose: To analyze differential responses of the parents of two types of institutionalized male and female delinquents termed individual delinquents and social delinquents; to make a special analysis of parental dominance, conflict, and parents' verbalized methods of handling various situations which relate to adolescence.

Subjects: The parents of 30 individual delinquents, thirty social delinquents, and thirty normal controls for each sex.
Methods: Each parent is interviewed alone, then both parents together. While one parent is being interviewed, the other is given a pencil and paper questionnaire containing revised items from the Stanford Parent Questionnaire developed by Winder and Rau. A combination of parametric and selected non-parametric statistics will be used to analyze data.
Duration: June 1965-June 1967.
Investigator(s): Mavis Hetherington, Ph.D., Associate Professor of Psychology, University of Wisconsin; and Paul H. Kusuda, M.A., Social Science Research Analyst, Bureau of Research and Statistics, State Department of Public Welfare, Madison, Wis. 53702. (Reported by NCCD.)

20-KM-12 SYSTEMATIZING COTTAGE TREATMENT OF DELINQUENT WARDS

Purpose: To develop a systematic, social-psychological conceptualization of environmental treatment in institutions for delinquent adolescents, where primary responsibility for fostering change typically resides in non-professional, minimally-trained cottage parents.
Subjects: Delinquent adolescents.
Methods: An attempt will be made to specify and interrelate critical situations and treatment techniques pertinent to cottage life in ways that can be understood and applied by the cottage staff. Preliminary data are gathered from cottage parents and others through the Critical Incident Technique and through participant observation, including both ecological and natural history methods. Resulting schema will be further refined through "Analytic Induction," related to the "research and development" approach used in industry. Project attempts to increase basic knowledge of environmental treatment while also providing an appropriate quasi-theoretical frame of reference within which a cottage staff can identify and work effectively with critical treatment opportunities.
Duration: September 1965-August 1967.
Investigator(s): Jerome Beker, Ed.D., Senior Research Associate, Youth Development Center, Syracuse University, 926 S. Crouse Ave., Syracuse, N. Y. 13210. (Reported by NCCD.)
Cooperating group(s): Berkshire Farm Institute for Training and Research, Berkshire Farm for Boys, N. Y.; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Presentation of the new schema, casebook, and research report planned.

20-KP-1 ASSESSMENT OF THREE TYPES OF GROUP COUNSELING IN A YOUTH TRAINING SCHOOL: THE PASO ROBLES PROJECT

Purpose: To evaluate effect of various types of cottage counseling on ward attitudes, institutional adjustment, and performance on parole.
Subjects: California Youth Authority wards, median age 16, assigned at random to four cottages upon intake at Paso Robles School for Boys.
Methods: One cottage served as control, one cottage provided only small group counseling, one cottage provided only cottage meetings, and one cottage provided a combination of small group counseling and cottage meetings. In the small group meetings, six or eight boys met once weekly with a cottage staff member. These groups were "closed" with constant membership until attrition forced the merging of remnants. The cottage or community meetings included the 50-boy cottage populations and on-duty staff. Boys served as monitors or moderators of the cottage meetings in

rotation. Before-after measurements were made on the Jesness Inventory. Incident data and other intramural performance data were collected. At periodic meetings with group leaders, tape recorded conferences produced data on content and form of the small group and cottage meetings.
Findings: The treatment cottages showed improved climates and improved behaviors relative to the control cottage. The effect was most pronounced in the cottage with the combined treatments.
Duration: July 1960-1965.
Investigator(s): Joachim P. Seckel, M.A., Associate Social Research Analyst, Division of Research, California Youth Authority, State Office Building No. 1, Sacramento, Calif. 95814. (Reported by NCCD.)
Cooperating group(s): Paso Robles School for Boys.
Publication: Final research report published by California Youth Authority.

20-KP-2 ASSESSMENT OF GROUP COUNSELING IN A YOUTH TRAINING SCHOOL

Purpose: To determine effects of non-directive small group counseling on older California Youth Authority wards at the Youth Training School.
Subjects: Male wards, median age 19, assigned randomly at intake into four living units accomodating 50 boys each.
Methods: Two living units of 10 boys each received group counseling once weekly from living unit supervisors while the two other groups served as controls. The groups were "open", admitting new members at any time in the history of the group. Counseling continued for duration of stay at the training school, approximately nine months. Pre-test and post-test data were collected by means of the Jesness Inventory. Post-release performance data were collected systematically from files of the Records and Statistics section. Effectiveness of treatment was measured by changes in ward attitudes and by performance on parole.
Findings: Boys in counseled units showed generally better attitudes and behaviors; communication between boys and staff improved considerably; staff gained valuable insights into motivations and behaviors in particular instances; boys gave frequent evidence of new insights into personal problems.
Duration: July 1960-1965.
Investigator(s): Joachim P. Seckel, M.A., Associate Social Research Analyst, Division of Research, California Youth Authority, State Office Building No. 1, Sacramento, Calif. 95814. (Reported by NCCD.)
Publication: Findings to be published in final research report.

THE CHILD IN THE FAMILY

Family relations

20-LA-1 PARENTAL FACTORS RELATED TO CREATIVITY IN CHILDREN

Purpose: To test hypotheses concerning parental behaviors associated with various degrees of test-measured creativity; to investigate efficacy of observation of structured situations as a means for collecting data on parent-child relations.
Subjects: 60 third grade children and their parents. Children were equally divided as to sex, were of middle class background, and scored high, middle, and low on the Minnesota Tests of Creative Thinking.
Methods: Subjects and their parents were observed interacting in a series of structured situations. Behaviors were categorized using an Esterline Angus recorder.
Findings: In the population from which the sample was drawn, children from one and two-child families were significantly more creative, as were oldest and only children.
Duration: September 1964-August 1966.
Investigator(s): Joan Aldous, Ph.D., Department of Family Studies and Sociology, University of Minnesota, Minneapolis, Minn.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-LA-2 A METHOD FOR ANALYZING FAMILY INTERACTION FROM VIDEO TAPES

Purpose: To adapt a previously developed method for analyzing audio family interaction tapes for use with video tapes.
Subjects: One nonclinical family.
Methods: Use of several judges to evolve categories and establish their reliability; development of an IBM information retrieval program for processing of data.
Duration: February 1966-February 1967.
Investigator(s): Helene Borke, Ph.D., Research Associate, Western Psychiatric Institute and Clinic, 3811 O'Hara St., Pittsburgh, Pa. 15213.
Publication: Publication in a professional journal.

20-LA-3 THE EFFECTS OF CERTAIN PARENT-CHILD INTERACTION PATTERNS ON THE CHILD'S EMANCIPATION FROM HIS EARLY DEPENDENCE ON HIS PARENTS: A LONGITUDINAL STUDY

Purpose: To test the hypotheses that reciprocal trust between parent and child promotes, and that lack of trust retards, the child's emancipation.
Subjects: 100 children from the age of 2 years, 9 months to 12 years. Each year 20 children entering the Institute of Child Study School are incorporated into the study and followed until they graduate from grade six.
Methods: The basic tool is an Emancipation Appraisal at regular intervals. This appraisal is based on parent interview material which systematically

893

samples parent-child interacting in the various areas of the child's life. The interactions are judged by experts trained to apply certain operational criteria of reciprocal trust. The various interaction patterns are combined to give an overall assessment of the child's emancipation. A Picture Test of Dependence-Independence has been developed to tap the child's own feelings of self-reliance at home and at school. The influence of the child's emancipation in the home on his progress beyond the home is judged by comparing this with his school adjustment as rated by teachers; his academic achievement, and his sociometric status.
Findings: A preliminary finding suggests that the child who lacks parental care (due to neglect, over-high parental expectation, rejection) and who tries to get along without help makes fewer independent choices on the Picture Test than do children who are acceptant of some parental care. A sex difference in the number of independent choices on the Picture Test begins to appear at Grades II and III. Girls are more dependent - perhaps a reflection of a cultural expectation.
Duration: 1962-1974.
Investigator(s): Carroll Davis, M.A., Research Associate, Institute of Child Study, University of Toronto, Toronto, Ont.
Cooperating group(s): Ontario Mental Health Grant.
Publication: Room to Grow, A study of parent-child relationships. Toronto, June 1966, University of Toronto Press.

20-LA-4 FAMILY AND SCHOOL INFLUENCES ON THE EDUCATIONAL ASPIRATIONS OF WORKING-CLASS AND MIDDLE CLASS NINTH GRADE BOYS

Purpose: To test some hypotheses about the relationship between educational aspirations of ninth grade boys and those their parents have for them; to investigate conditions under which parents are successful or unsuccessful in transmitting their aspirations to their children; to test finding in a previous study of eighth graders that parental aspirations counteract potential influence of school on children's aspirations; to determine by comparison of data obtained from boys and their parents how much confidence can be placed in data obtained from either alone; and to collect data on ninth grade boys which can be evaluated in five years for its usefulness in predicting their final educational level.
Subjects: 1,400 boys and the parents in 300 of their families.
Methods: Questionnaire data from boys and interview data from the parents. Academic grades and I.Q.'s of boys are secured from school records.
Duration: Not reported-September 1967.
Investigator(s): Paul Wallin, Ph.D., Professor of Sociology, and Freda B. Wallin, B.A., Research Associate in Sociology, Stanford University, Stanford, Calif.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-LD-1 SINGLE PARENT FAMILIES

Purpose: Comparative study of three major categories of single parenthood: widowed fathers and mothers, divorced mothers, and unwed mothers.
Subjects: All mothers within the age category of 20 to 49, widowed in 1962, with at least one child under 18; all fathers in the above circumstances; all mothers within the age category of 20 to 49, divorced in 1962, with at least one child under 18; and all unwed mothers in the above age category who decided to keep child born during the year 1962.
Duration: November 1964-1967.

Investigator(s): Jetse Sprey, Ph.D., Associate Professor of Sociology, Western Reserve University, Cleveland, Ohio 44106.
Cooperating group(s): Social Security Administration, U. S. Department of Health, Education, and Welfare.
Publication: Research papers are planned along the line of progress; monograph is planned for final presentation.

20-LG-1 ECONOMIC STATUS, UNEMPLOYMENT, AND FAMILY GROWTH

Purpose: To study important aspects of relation of economic status to family growth in the Detroit area, focusing on patterns and dynamics of family composition and growth and how they are affected by both initial and shifting economic status.
Subjects: A cross-sectional sample of 1,300 white married women in the Detroit Metropolitan Area at selected stages in the family life cycle. This includes women who became married in June 1961, or had a first, second, or fourth child in July 1961.
Methods: An intensive interview taken in 1962 covered many phases of family life and history, information regarding respondents' family expectations and preferences, their pregnancy histories, and a wide range of social and economic variables. Two follow-up interviews--chiefly by telephone--with the same women over a two-year period were conducted to determine changes in family situation and plans. Multivariate analysis of data obtained has emphasized relation of economic factors to fertility behavior.
Findings: In the aggregate, there is remarkable consistency of expected family size over time; current income is not related to expectations, but is highly important for timing of demographic events; family size expectations are influenced by the couple's perceptions of its economic position and decisions it makes about family expenditures, quite apart from effect of objective income itself; spacing of children, and in particular pregnancy status at marriage, is highly related to income and asset position the couple achieves.
Duration: November 1962-August 1965.
Investigator(s): Ronald Freedman, Ph.D., Professor of Sociology, and Director, and Lolagene C. Coombs, M.A., Research Associate, Population Studies Center, University of Michigan, Ann Arbor, Mich.
Cooperating group(s): Social Security Administration, U. S. Department of Health, Education, and Welfare.
Publication: Public Opinion Quarterly, Vol. 28, Spring 1964; Demography, Vol. 2, 1965; Population Studies, in press; Milbank Memorial Fund Quarterly, in press; and other articles submitted for publication.

20-LJ-1 THE INFLUENCE OF PARENTAL PSYCHOSIS ON CHILD DEVELOPMENT

Purpose: To inquire into vulnerability factors at work causing degrees of disturbance among children in the family.
Subjects: Children of psychotic parents and a control group of children of parents with chronic physical illness.
Methods: Naturalistic exploration of family environment; also Piaget-type tests of thinking, Witkin-type tests of perceiving, and psycho-physiological investigation.
Findings: Pilot findings indicate that age and sex of children may play a crucial role in producing a disturbance.
Duration: February 1956-1971.
Investigator(s): E. James Anthony, M.D., Professor of Child Psychiatry, Medical School, Washington University, St. Louis 6, Mo.

Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Report on small pilot investigation being prepared for press.

20-LJ-2 CHILDREN OF POST-HOSPITAL MENTAL PATIENTS: A DESCRIPTIVE STUDY

Purpose: To describe family structure of ex-state hospital patients, focusing on number of minor children in household and their structural and emotional ties with the ex-patient.
Subjects: Minor children (under 21 years of age) in household where an ex-state mental patient resides. Sample of 600 former state patients released in 1956 are being located and interviewed 10 years after release.
Methods: Through interviews with approximately 600 former patients, data are collected regarding minor children residing in the ex-patient's household. Data will be analyzed in order to provide certain descriptions of the number and ages of children and their relationship to the former mental patient. A description of the family composition in relation to the former patient's family role position will be carried out as a basis for further work in the study of impact of psychotic persons upon children.
Findings: About 80 percent of married ex-patients have minor children living in their households. Patient-mothers are not as likely to be rehospitalized as are patient-fathers. Patient-mothers are not as likely to be rehospitalized as are patient non-mothers.
Duration: June 1964-June 1967.
Investigator(s): Dorothy Hillyer Miller, M.A., Research Specialist I, California Department of Mental Hygiene, Social Research Laboratory, 3330 Geary Blvd., San Francisco 18, Calif.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: A paper is planned for submission to a professional sociological journal. Final reports to be available June 1967.

20-LJ-3 PREGNANCY AND PSYCHOSIS

Purpose: To examine influence of psychosis on process of pregnancy and subsequent early infant development, and influence of pregnancy on psychotic condition.
Subjects: Pregnant psychotic mothers hospitalized in a state hospital and infants born to them.
Methods: Interviews of psychotic mothers during pregnancy and after delivery, and intensive observation of infants during first weeks of life.
Duration: September 1964-September 1967.
Investigator(s): Bernard Rosenblatt, Ph.D., Chief Psychologist, Worcester Youth Guidance Center, 275 Belmont St., and David Moriarty, M.D., Clinical Director, Worcester State Hospital, Worcester, Mass. (Reported by Sebastiano Santostefano, Ph.D., Director of Research, Worcester Youth Guidance Center.)

Child rearing

20-MA-1 STRUCTURE OF MATERNAL ATTITUDES IN TWO CULTURES

Purpose: To determine differences in the factorial structure of maternal attitudes in Filipino and American mothers.
Subjects: 133 American and 134 Filipino mothers of elementary school children.
Methods: Administration of the Parental Attitude Research Instrument (PARI), 23 scales of five items each; separate analysis of data for each group; comparison of analyses for homogeneity of item content.
Findings: Filipino mothers show more concern with parental control and authority, while American mothers show concern for their children being on their own and responsible for their own behavior. This is consistent with data obtained by observation. Data suggest that much caution should be observed when using variables defined in one culture in the study of personality development in another culture. Although a pattern of behavior encompassed by given items may be homogeneous, the whole pattern may occur in a different context of motivation and therefore have quite different significance in one society than in another. The same set of items may not be measuring the same thing in each culture.
Investigator(s): George M. Guthrie, Ph.D., Professor of Psychology, Pennsylvania State University, University Park, Pa.
Publication: Paper read at annual meeting of the Japanese Psychological Association, Tokyo, July 1965; copy available from investigator.

20-MA-2 SOCIAL EFFECTS OF EDUCATION ON CHILDREN OF SUBURBAN BLUE COLLAR WORKERS

Purpose: To examine variation in attitudes toward education for one's children; to see how those attitudes may be affected by three sets of interpersonal relations: those centering in the extended family, those arising in the work place, and those developed through friendship patterns and voluntary participation in formal organizations.
Subjects: 500 white Protestant working class fathers of suburban public high school students.
Methods: Survey questionnaire with analysis primarily nonparametric unless true interval scales can be constructed. In that event, computer programs to analyze multivariate data are utilized; also, a computer program is used to construct interval scales.
Duration: June 1965-June 1966.
Investigator(s): Robert T. Stout, Doctoral Candidate in Educational Administration, University of Chicago, 5835 S. Kimbark, Chicago, Ill. 60637.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-MD-1 OBSERVATION AND ANALYSIS OF MOTHER-CHILD INTERACTIONS

Purpose: To apply new and refined observational methods to the study of interaction patterns between three-, four-, and five-year old children and their mothers; to demonstrate that the method can delineate characteristic styles of communication in individual subject-pairs, that it is equally effective with subjects of different ages, cultural backgrounds (advantaged

and disadvantaged), or with disturbed children of contrasting types of behavior disorder (withdrawal and nonparticipation vs. inappropriate impulsivity).
Subjects: 10 each three-, four-, and five-year old children drawn from a culturally advantaged population; 10 four-year olds from the Seattle Operation Headstart project; 20 boys, aged three, four, and five, drawn from the rosters of the University of Washington Child Psychiatry Clinic.
Methods: Recording of nonverbal behavior codings by highly trained observers simultaneously with recording verbal interchanges of subjects; analysis of material in terms of single empirically defined nonverbal acts, broad avenues of communication, and combination of verbal and nonverbal data on more abstract behavior dimensions; at each of these levels, assessment of systematic differences in the frequency, duration, and/or sequential ordering of patterns of events by means of contingency analysis techniques.
Duration: July 1965-1967.
Investigator(s): Kate L. Kogan, Ph.D., Clinical Associate Professor of Psychiatry, and Herbert C. Wimberger, M.D., Assistant Professor of Psychiatry and Director, Child Psychiatry Clinic, School of Medicine, University of Washington, Seattle, Wash. 98105.
Cooperating group(s): Boeing Good Neighbor Fund; National Institutes of Health, U. S. Department of Health, Education, and Welfare.
Publication: Reports to be prepared for professional psychiatric and psychological journals as different aspects are completed; copies of papers describing methodology, presented at professional meetings, are available from investigators on request.

20-MD-2 CHILD TRAINING AND CHILD CARE PRACTICES AS ANTECEDENTS TO LEVELS OF ADRENALINE AND NOR-ADRENALINE

Purpose: To explore genetic and experiential background to greatly differing, but apparently consistent, levels of adrenaline and noradrenaline found in urine of children; to explore relation of these levels to child behavior and personality.
Subjects: 50 boys, all those born in Solna (Stockholm suburb) in 1958, and their parents.
Methods: Fluorimetric bioassay of night urine for catecholamine rate per minute over one night of sample boy and his two parents. Data from longitudinal study over eight years on physical and mental development, and spanking and other disciplinary patterns used on each child. Some ratings on personality, as well as teachers' reports.
Duration: September 1965-December 1966.
Investigator(s): William W. Lambert, Ph.D., Professor, Department of Psychology, Cornell University, Ithaca, N. Y.; Marian Frankenhaeuser, Ph.D., Docent, Psychology Department, University of Stockholm; and Ingrid Klackenberg-Larsson, Director, Psychology Development, Solna Study, Karolinska Sjukhuset, Stockholm, Sweden.
Cooperating group(s): Solna Longitudinal Study; Swedish Institute for Social Research; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Preliminary results were to be reported at an international meeting on development research, June 23, 1966.

20-MG-1 PARENTS' DISCUSSION GROUP AT P.S. 289, BROOKLYN, N. Y., "TO LEARN THROUGH DISCUSSION HOW TO IMPROVE CHILDREN'S BEHAVIOR AND LEARNING AT HOME AND SCHOOL"

Purpose: To test hypothesis that, if parents or parent-person of children in kindergarten and first grade would attend a weekly discussion group for 15 weeks, there would be improvement in behavior and learning of children in school and in home.
Subjects: Parents and parent-persons of approximately 185 children in kindergarten and first grade in P.S. 289, whose children did not speak clearly, used bad language, were enuretic, had nervous habits, and exhibited anti-social behavior.
Methods: Parents were requested to respond on enclosed postcard if they would attend weekly discussions. Thirty-five responded, and 22 came, no parent more than seven times. Parents raised problems for discussion, while discussion leader gave insight or interpretation when requested. Parents, teachers, and social agencies reported effects on children and parents.
Duration: February-June 1965.
Investigator(s): Jeannette D. N. Fuchs, Ed.D., Assistant Professor of Education, Brooklyn College of the City University of New York, Brooklyn, N. Y. 11210.
Cooperating group(s): New York City Board of Education.
Publication: To be reported in Campus Schools News of New York City Board of Education.

SOCIAL, ECONOMIC, AND CULTURAL INFLUENCES

20-NA-1 ESKIMO IN A BAFFIN ISLAND TOWN

Purpose: To investigate the adjustment of Eskimo adults and children in a town where many only recently arrived.
Subjects: Individuals opportunistically selected for observation in a total population of about 900.
Methods: Observation and informal interviewing.
Investigator(s): John J. Honigmann, Ph.D., Professor of Anthropology, and Irma Honigmann, B.A., University of North Carolina, Chapel Hill, N. C.
Cooperating group(s): Northern Co-ordination and Research Centre of the Department of Northern Affairs and National Resources, Government of Canada.
Publication: Honigmann, John J. and Honigmann, Irma, Eskimo Townsmen, Ottawa: Canadian Research Centre for Anthropology, University of Ottawa, 1965; North 11:5:16-22, September-October 1965.

20-NA-2 CROSS-CULTURAL STUDY OF DEVELOPMENT OF CONCEPTS OF WOMEN'S ROLES--JAPANESE-AMERICAN GIRLS IN HAWAII AND NEW YORK CITY GIRLS

Purpose: To compare sex-role perceptions of girls in differing cultural milieus.
Subjects: Girls of Japanese ancestry in Hawaii, and girls from typically "majority" cultural backgrounds in New York City, eight and 11 years of age.
Methods: Structured interviews and responses to wide range of pictorial materials depicting various aspects of sex-role activity.
Duration: 1964-1965.
Investigator(s): Hazel V. Kraemer, Ph.D., Professor of Child Development and Family Study, University of Hawaii, Honolulu, Hawaii; and Ruth E. Hartley, Ph.D., Psychological Consultant, Consultation Services, 54 Morningside Dr., New York, N. Y.
Cooperating group(s): Faculty Research Fund, University of Hawaii; U. S. Department of Health, Education, and Welfare.
Publication: Several reports of results from the New York City sample have been published by Ruth E. Hartley; report of comparative data to be submitted to appropriate professional outlets.

20-NA-3 PREVENTION OF CULTURALLY DETERMINED RETARDATION

Purpose: To develop child rearing programs for day and residential care of children under three years of age from disadvantaged backgrounds; to develop a training program for child caretakers; to develop research programs which will evaluate effects of the various components in the child rearing programs and determine degree of success in preventing culturally determined retardation and distortion of personality development.
Subjects: 16 homeless infants in their first weeks of life from disadvantaged backgrounds; 16 infants from matched backgrounds reared in own

homes except for day care; and 32 infants from matched backgrounds reared entirely in own homes.
Duration: October 1964-September 1967.
Investigator(s): Reginald S. Lourie, M.D., Director, and Allen E. Marans, M.D., Research Associate, Department of Psychiatry, Children's Hospital of the District of Columbia, 2125 13th St., N. W., Washington, D. C.
Cooperating group(s): Queen Anna-Maria Institute for Child Health, Athens, Greece; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Papers will be published in appropriate publications and presented at appropriate conferences.

20-NA-4 A BABY'S FIRST THREE MONTHS: COMPARISON OF DUTCH AND AMERICAN FAMILIES

Purpose: To compare equivalent Dutch children with previously collected United States data on life in the first three months.
Subjects: 10 babies in Enschede, Holland of middle class intact families; U. S. babies were from Boston suburbs.
Methods: Three hours of systematic intermittent observations done in the home every two weeks in the first three months of life. Each baby is thus seen six times, for a total of 18 hours. Each observation period is recorded on a checksheet listing baby and mother behaviors, and environmental conditions--noise level, number of toys, people in room, etc.
Duration: January-December 1966.
Investigator(s): Freda Gould Rebelsky, Ph.D., Assistant Professor of Psychology, Boston University; on leave of absence as Senior Lecturer, University of Utrecht, Holland.
Publication: To be submitted to Child Development.

20-NA-5 THE ATTITUDES AND CONCERNS ABOUT MARRIAGE AND THE FAMILY OF NINTH-GRADE PUPILS FROM THE PUBLIC SCHOOLS OF GEORGIA

Purpose: To determine concerns of ninth-grade pupils with the important aspect of the life ahead for most of them--marriage and the family.
Subjects: 222 boys and 243 girls.
Methods: Use of an inventory involving questions and data to be given relative to their concerns.
Findings: Over 90 percent expressed a desire for more than one child in case of marriage; over 90 percent of boys listed housewife as the occupation they wanted their wives to follow; over 80 percent of boys and over 70 percent of girls stated they expected both parents to be equally concerned in rearing children.
Duration: September 1964-completed.
Investigator(s): Karl C. Garrison, Ph.D., Professor of Education, Old Dominion College, Norfolk, Va. 23508.
Cooperating group(s): Principals of schools in Georgia.
Publication: To be published in Adolescence, Vol. 1, No. 1, Libra Publishers, Inc.

20-NA-6 SECONDARY EDUCATION IN TRANSITIONAL SOCIETIES (IVORY COAST)

Purpose: To examine allocative functions of complex European-type secondary school system in African context, with interest centering on

901

role of education in processes of social mobility and elite formation in new states.
Subjects: Over 2,000 students drawn for troisieme and baccalaureate classes within all types of post-primary school.
Methods: Examination of social and ethnic factors influencing selection for and recruitment into secondary school system; analysis of patterns of internal mobility within the system in terms of retardation and movement between high and low status institutions.
Duration: 1963-1965.
Investigator(s): Philip J. Foster, Ph.D., Associate Professor and Assistant Director, Comparative Education Center, University of Chicago; and Remi P. Clignet, Doctorat en Recherche (Paris), Assistant Professor of Sociology, Northwestern University, Chicago, Ill.
Cooperating group(s): Carnegie Foundation.
Publication: Major publication to appear in late 1966.

20-NA-7 CHINESE YOUTH AND FAMILY IN SOUTHEAST ASIA

Purpose: To describe forces that motivate, facilitate, and direct changes within Chinese youth population in Southeast Asia, with particular emphasis on family processes and change.
Methods: Data collected from high school population in Hong Kong, Taipei, Manila, and Singapore by employing different criteria for sampling in each city.
Duration: Not reported-June 1967.
Investigator(s): William T. Liu, Ph.D., Associate Professor of Sociology, University of Notre Dame, Notre Dame, Ind.
Cooperating group(s): Notre Dame University Faculty Research grant; Social Science Research Council.

20-NA-8 A COMPARATIVE STUDY OF ANOMIE IN THE KIBBUTZ

Purpose: To investigate state of anomie in the Kibbutz in relation to recent incidents of organized juvenile delinquency in two of Israel's senior agricultural collectives, and to study other forms of social and emotional deviance.
Subjects: Juvenile populations of 25 Kibbutzim, representing all political parties.
Methods: Use of objective and subjective indices to assess rate of anomie in each Kibbutz, including rates of suicide, crime and delinquency, and prostitution, as well as scaled measures of normlessness, powerlessness, anomia, and psychopathology. All variables are intercorrelated. Interviews are conducted with randomly chosen subsamples from various strata within each Kibbutz.
Duration: January 1965-January 1968.
Investigator(s): Salomon Rettig, Ph.D., Professor of Psychiatry, School of Medicine, Ohio State University, Columbus, Ohio 43210; and Shlomo Shoham, Senior Lecturer and Director, Institute of Criminology, Bar-Ilan University, Israel.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-NA-9 MOTIVATIONAL FACTORS INFLUENCING ACADEMIC ACHIEVEMENT OF ELEVENTH GRADE PUERTO RICAN HIGH SCHOOL STUDENTS

Purpose: To test certain assumptions about similarities and differences in academic motivation between the "now" oriented Insular and the "future" oriented Continental United States culture; to elaborate understanding in related areas of Puerto Rican motivation where prediction of expected outcomes cannot yet be made; to look within the Insular culture to determine homogeneity of components by study of three assumed subcultures; and to sharpen understanding, through use of interviews, by focusing on parental influences which hold promise of relating to academic motivation.
Subjects: Eleventh grade students in Puerto Rico.
Methods: Both item and scale validation are done on responses of separate samples of subjects. Criterion groups to illustrate high and low motivation are selected from a regression analysis definition of under- and over-achievement.
Duration: Not reported-August 1967.
Investigator(s): Edward W. Christensen, College of Education, University of Puerto Rico, Rio Piedras, P. R.; and William W. Farquhar, Ph.D., Department of Education, Michigan State University, East Lansing, Mich.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Final report to Office of Education August 1967.

20-NA-10 SOCIAL MOBILITY AND THE ENGLISH LANGUAGE IN PUERTO RICO: INFLUENCES ON MOTIVATION AND OUTLOOK OF NINTH GRADE PUPILS

Purpose: To identify relative importance of pupils' social background, type of school, academic competence, vocational aspirations, and type of community of residence upon interest in or disinterest for study of English in a Spanish-speaking part of United States society.
Subjects: Pupils in both public and private schools, from classrooms selected for representativeness as to type of school, character of locale, section of country, etc.
Methods: Collection of both objective data and attitudes regarding academic careers and role of two languages in personal, public, and occupational life.
Duration: Not reported-March 1966.
Investigator(s): Erwin H. Epstein (Doctoral Candidate, University of Chicago), Department of Educational Policy Studies, University of Wisconsin, Madison, Wis. 53706; and C. Arnold Anderson, Ph.D., Professor, Department of Education, University of Chicago, Chicago, Ill. 60637.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-NA-11 COMPARISON OF AMERICAN AND NORWEGIAN NURSERY SCHOOL CHILDREN ON INDEPENDENCE BEHAVIOR AND TRAINING

Purpose: To compare Norwegian and American nursery school children for amount of dependency they exhibit in a task-situation with a stranger (investigator) and in a task-situation with their mothers; to compare amount of independence-training by mothers of two national groups; and to relate individual differences in child's dependency to differences in independence-training.
Subjects: American and Norwegian nursery school children, ages four and a half to five, 12 to 20 children in each group.

Methods: Investigator sets up a task-situation for subject; instruments chosen are toys and games (puzzles and blocks) suitable for subject's age, and on an increasing scale of difficulty. Amount of child's help-seeking is recorded, with tape recorder and on recording sheets, in situation with mother and with stranger (investigator).
Duration: Not reported-1966.
Investigator(s): Else Wern Hjertholm, Graduate Student, and Lawrence Kohlberg, Ph.D., Department of Psychology, Committee on Human Development, University of Chicago, Chicago 37, Ill.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-NA-12 INFLUENCES OF CULTURAL PATTERNS ON THE THINKING OF CHILDREN IN CERTAIN ETHNIC GROUPS

Purpose: To determine effect of differing cultural ideals, values, and patterns upon cognitive style of children, specifically with regard to field-dependence, as defined by Herman Witkin and associates; to validate a new verbal measure of field-dependence, the Verbal Disembedding Test.
Subjects: 100 10-year old boys: 50 highly traditional Jewish, 30 white Anglo-Saxon Protestant, compared with Herman Witkin's normative population of 56 partially acculturated Jewish boys.
Methods: The following tests are administered: Body Adjustment Test, Wechsler Intelligence Scale for Children, Embedded Figures Test, Figure Drawing Test (Hanna Marlens' Sophistication of Body Concept), and Verbal Disembedding Test.
Findings: Jewish children were found to be more field-dependent than the Protestant children on Body Adjustment, Block Design, Object Assembly, and Figure Drawing tests.
Duration: June 1965-July 1966.
Investigator(s): Zachary Dershowitz, Ph.D., Assistant Professor of Education, Long Island University, Brooklyn Center, 1637 54th St., Brooklyn 9, N. Y.
Cooperating group(s): Downstate Medical Center; National Foundation for Jewish Culture; Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Division of Elementary-Secondary Research, Office of Education; Mimeographed copies of doctoral dissertation available through Long Island University; New York University Library; University Microfilms.

20-NA-13 A STUDY OF METHODS OF PREPARATION OF INFANT FORMULAS: A MEDICAL AND SOCIO-CULTURAL APPRAISAL

Purpose: To determine the efficiency with which recommended procedures for home preparation of infant formulas are followed, and whether and how socio-economic or socio-cultural factors modify advice given by health personnel; to determine whether simplified techniques may be substituted for present procedures in urban areas with approved water supply.
Subjects: High-risk mothers and their infants now receiving care under the Maternal and Infant Care program of the Department of Obstetrics of Temple University School of Medicine delivered at Temple University Hospital; also, a non-MIC group of ward, semi-private, and private patients delivered at the same hospital.
Methods: Socio-economic status will be determined from Census tract data or conventional indices such as occupation, education, etc. Interviews will be conducted with new mothers prior to discharge from hospital and

instructions given regarding preparation of formula. Home visits will be made several weeks later to determine methods used and if, how, and why they differ from recommended procedures; cultures will be made of formula, containers, and utensils used. Standard statistical methods will be used to test confidence limits of interpretation of data.
Duration: June 1966-May 1967.
Investigator(s): Norman Kendall, M.D., Associate Professor of Pediatrics; Victor C. Vaughan, III, M.D., Professor of Pediatrics; William P. Barba, II, M.D., Associate Professor of Pediatrics; and Earle H. Spaulding, Ph.D., Professor of Microbiology, Temple University School of Medicine, 3400 N. Broad St., Philadelphia, Pa. 19140.
Cooperating group(s): Temple University Hospital; Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

20-ND-1 THE SOCIAL PSYCHOLOGICAL CORRELATES OF OCCUPATION

Purpose: To ascertain the social psychological correlates, including parental values and child-rearing practices, of a number of dimensions of occupational experience.
Subjects: 3,000 men, a representative sample of all men employed in civilian occupations in the U.S.
Methods: Structured interviews.
Duration: 1962-indefinite.
Investigator(s): Melvin L. Kohn, Ph.D.; Carmi Schooler, Ph.D.; and Morris Rosenberg, Ph.D., Laboratory of Socio-environmental Studies, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda 14, Md.
Cooperating group(s): National Opinion Research Center, University of Chicago.
Publication: To be published in appropriate professional journals.

20-ND-2 A STUDY OF THE RELATIONSHIPS BETWEEN THE EDUCATIONAL PLANS OF "AVERAGE" HIGH SCHOOL SENIORS AND SOME OF THE SOCIAL CONDITIONS IN THEIR LIVES

Purpose: To distinguish between those students of "average" ability who plan to continue their education and those who do not.
Subjects: High school seniors from the class of 1960 in the State of Rhode Island, 876 girls and 417 boys.
Methods: Administration of the Your Educational Plans Inventory, an untimed paper and pencil series of questions concerning social conditions; identification of subjects planning to continue or not to continue education after high school; examination of responses to YEP inventory to determine if it can distinguish between those intending to continue education and those intending not to do so.
Findings: Indication of an association between post-high school educational intentions and certain conditions in the social milieu of the subjects.
Duration: June 1960-August 1965.
Investigator(s): Herbert S. Parker, Ed.D., Vice President, U.S. Industries, Inc., Educational Science Division, 12345 New Columbia Pike, Silver Spring, Md. 20910.
Cooperating group(s): Bureau of Research, Rhode Island State Department of Education.
Publication: Thesis is available through the offices of the American Personnel and Guidance Association; Teachers College, Columbia University; and the author.

20-ND-3 ADOLESCENT CAREER PLANS AND THE IMPACT OF CHRONIC ECONOMIC DISTRESS UPON ADOLESCENT EDUCATIONAL AND OCCUPATIONAL ASPIRATIONS

Purpose: To increase proportion of adolescent career plan variation accounted for by specific variables; to assess impact of chronic economic distress upon career plans of adolescents; and to assemble data for a longitudinal analysis of career plan change and constancy in both economically prosperous and distressed areas.
Subjects: 6,500 adolescents who were enrolled as high school sophomores in 1963 in all public and parochial secondary schools in six Pennsylvania third class cities, three economically depressed, three prosperous.
Methods: Collection of data on following independent variables: parental socio-economic status level; socio-economic level of subjects' schools and peer groups; career plan levels set for subjects by parents; career plan levels of peer groups; degree to which education of subjects' mothers is markedly higher than that of fathers; intensity of parental pressure on subjects to continue education beyond high school; size of subjects' families; and subjects' birth order.
Investigator(s): Richard A. Rehberg, Center for the Advanced Study of Educational Administration, University of Oregon, Eugene, Oreg. 97403; and David L. Westby, Ph.D., Assistant Professor, Department of Sociology-Research, Pennsylvania State University, University Park, Pa. 16802.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Report available from investigator; paper presented to Eastern Sociological Society, April 1966.

20-ND-4 YOUTH UNEMPLOYMENT: FRICTIONS IN THE THRESHOLD OF THE WORK CAREER - AN EXPLORATORY PROBE

Purpose: To determine relationship of attitudes, needs, expectations, beliefs, and perceptions of unemployed youth as they relate to desirable and undesirable work experience and socio-economic characteristics associated with those subjective attitudes.
Subjects: Three samples of 100 individuals each, drawn from public high schools and consisting of recent high school graduates, high school students identified by their school counselors as potential dropouts, and persons who actually drop out.
Methods: Youth in sample are followed for one year after first contact, and work experience of each is studied, including such factors as job-finding time if employed, pay rate, number of jobs held, time employed, and job satisfaction. Factors believed to be cause of employment experience of each youth are obtained by testing, questionnaires, and interviews. Factors consist of level of education, attitudes, needs, expectations, beliefs and perceptions, job-seeking behavior, work history prior to data collection period, aptitudes, and demographic variables such as race, parental occupation, and parental education. Subjective attitudes and job experience of sample groups are analyzed to determine actual extent and importance of above factors in determining success or lack of success at employment.
Duration: 1965-1967.
Investigator(s): Rene V. Dawis, Ph.D., Industrial Relations Center, University of Minnesota, Minneapolis, Minn. 55455.
Cooperating group(s): Office of Manpower, Automation, and Training, U. S. Department of Labor.

20-NG-1 THE SOCIALIZATION OF ADOLESCENT POLITICIANS

Purpose: To determine factors in homes, schools, and peer groups of children which contribute to differential civic involvement, i.e., leadership of voluntary associations, membership in political organizations, activity in high school political campaigns, and to explore this sort of activity with political participation later in life.
Subjects: National sample of 1,669 high school seniors (class of 1965) in 97 high schools, chosen on a probability basis.
Methods: Interviews with subjects and at least one parent, with principals of selected schools, and with social studies teachers.
Duration: June 1965-August 1966.
Investigator(s): David R. Segal, Ph.D. Candidate, Social Psychology Laboratory, University of Chicago, Chicago, Ill. 60637.
Cooperating group(s): Survey Research Center, University of Michigan; American Heritage Foundation.
Publication: Will probably appear as a series of articles starting in 1967.

20-NM-1 TRENDS AND VARIATIONS IN FERTILITY IN THE UNITED STATES

Purpose: To describe trends and differentials in fertility in the United States.
Subjects: Use of Census data in children ever born in relation to certain characteristics--medical and biological characteristics of births, fecundity and family planning, differential fertility by nativity, color, residence, migration, marital characteristics, education, occupation, and other indices of socio-economic status.
Findings: Some reduction in differentials except those by color and religion.
Duration: 1960-1966.
Investigator(s): Clyde V. Kiser, Ph.D., Senior Member, Technical Staff, Milbank Memorial Fund, New York, N. Y. 10005; Wilson H. Grabill, Chief, Family and Fertility Statistics, Bureau of the Census; and Arthur A. Campbell, M.A., Chief, Natality Branch, Division of Vital Statistics, National Center for Health Statistics, U. S. Department of Health, Education, and Welfare, Washington, D. C.
Cooperating group(s): National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: The entire series is scheduled for publication by the Harvard University Press.

20-NM-2 YOUNG CHILDREN AND THE WATTS REVOLT: REACTIONS OF NEGRO, MEXICAN-AMERICAN, AND WHITE PRESCHOOL CHILDREN TO THE 1965 LOS ANGELES RACE RIOTS

Purpose: To assess differential awareness and impact on Negro, Mexican-American, and white children of the five days of violence, destruction, and disorganization in Los Angeles. Specifically investigated were extent and accuracy of awareness of riot events; experiences of fear; and favorable and unfavorable attitudes toward participants and antagonists in the rioting.
Subjects: 107 Negro preschool children of both sexes and 23 Mexican-American preschoolers, all living in or near the riot area; and 52 white children from private kindergartens outside riot area. All subjects were four or five years of age.
Methods: Individual, semi-structured interviews, conducted and recorded

verbatim by experienced Negro, white, and Spanish-speaking interviewers. All subjects were interviewed within two day period immediately after end of rioting and lifting of curfew. Protocols were independently judged with high agreement by two raters for awareness of riot and its events; fears expressed or clearly implied; and attitudes toward riot participants, including punishments recommended.

Findings: Aware of riot: 92 percent Negro, 78 percent Mexican-American, 71 percent white, with most vivid reports given by riot-area subjects. With the riot-aware subjects, the most frequently mentioned events were the fires: 70 percent Negro, 89 percent Mexican-American, 61 percent white. Fear: Approximately 50 percent in each group indicated some experience of fear during the time. Attitudes: In all groups, high proportion advocated punishment or retaliation toward Negro rioters. Small numbers of Negro subjects showed only sympathy toward rioters or only fear/hostility. Most Negro subjects combined punitive response with indications of sympathy or identification with the rioters and appeared in some conflict or ambivalence. Mexican-American subjects were quite reticent, but feelings expressed were almost uniformly hostile-fearful toward Negro rioters and Negroes in general. White subjects showed a variety of attitudes, including fear and punitiveness. About one-fourth indicated some awareness of Negro rioter motivation (poverty, discrimination) or of individual differences (some good, some bad) projectively identified with the rioters.

Duration: August 1965-completed.

Investigator(s): Ralph L. Dunlap, Ph.D., Chief Psychologist; Astrid Beigel, A.B., Research Scientist; and Virginia Armon, Ph.D., Supervisor, Clinical Psychology Training, Southern California Permanente Medical Group, 4900 Sunset Blvd., Los Angeles, Calif. 90027.

Cooperating group(s): Los Angeles County Superintendent of Schools--Project Head Start; Bellview Community Church Nursery School; University of Southern California Youth Studies Center--Crenshaw Community Project; Los Angeles Suicide Prevention Center.

Publication: Submitted for publication; copies of report available on request from Dr. Dunlap.

20-NM-3 ATTITUDES TOWARD CIVIL LIBERTIES AMONG HIGH SCHOOL SENIORS

Purpose: To explore relationship between attitudes toward civil liberties and beliefs about nonconformity among high school seniors.

Subjects: All seniors enrolled in the several public, private, and parochial high schools in Portland, Oregon, and its environs.

Methods: A self-administered survey questionnaire is distributed to all seniors. Besides eliciting responses to issues of constitutional law, questionnaire includes (1) measures of social and political anomie and alienation, (2) semantic differential procedures to develop a meaning profile regarding deviant causes and people, and (3) questions concerning social background characteristics of this population of respondents.

Duration: June 1965-November 1966.

Investigator(s): John C. Pock, Ph.D., Associate Professor of Sociology, Reed College, Portland, Oreg. 97202.

Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-NM-4 EFFECTS OF CLASS AND RACIAL BIAS ON TEACHER-EVALUATION OF PUPILS

Purpose: To test hypothesis that, given otherwise identical descriptions of pupils, teachers will tend to rate social and personal adjustment of lower class and Negro students as poorer than that of middle class or white students.

Subjects: Elementary school teachers in New York City.

Methods: Teachers will be given identical vignettes describing behavior of a nine-year old child. For half of the teachers, child will be white, for other half, Negro. Within each condition, for half the teachers, child will be middle class, and for other half, child is lower class. As a control, half of the descriptions will be those of boys, and half will be those of girls. In addition, half of the children are to be "orderly, interested in classwork, and otherwise normal." The other half are to be "unruly, disinterested, and otherwise disruptive." Personality and background material of teachers will be obtained and utilized in analysis of findings.

Duration: June 1965-June 1966.

Investigator(s): George S. Rotter, Assistant Professor, and Naomi Gotkis, Research Assistant, Department of Psychology, Long Island University, Brooklyn, N. Y. 11201.

Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

EDUCATIONAL FACTORS AND SERVICES

General

20-OD-1 EFFECTS OF SELECTED FILM AND COUNSELING EXPERIENCES ON ATTITUDES TOWARD COLLEGE

Purpose: To determine effects of educational counseling and an experimental film on attitudes toward college of capable high school senior girls who indicate low probability of attending college.
Subjects: 191 capable high school senior girls indicating low probability of attending college.
Methods: Various combinations of one counseling interview and showing of a film designed to change attitudes toward college. Criterion measures used are The College Questionnaire and applications for college admissions during four-month period following treatment phase.
Findings: Girls indicating low finances as chief obstacle to college attendance held significantly more favorable scale-measured attitudes toward college than did those selecting motivational factors as primary deterrent to college. Low-finance group subsequently applied for college admission in significantly greater numbers than did low-motivation group. Among low-motivation subjects only, students who saw film and were also individually counseled scored significantly higher on attitude-scale measure than did students who were group counseled. Evidence suggests that counseling may influence some low-finance subjects to apply for college admission.
Investigator(s): Howard J. Sullivan, Ph.D., Assistant Professor of Education, Arizona State University, Tempe, Ariz.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: *Journal of Counseling Psychology* 13:1, 1966.

20-OL-1 STUDY OF CONTROLLED TRIALS OF VARIOUS PUNISHMENTS IN A SCHOOL POPULATION

Purpose: To determine the effect of various punishments on subsequent conduct of school boys.
Subjects: 150 boys, ages 12 to 16.
Methods: Boys were subjected to randomized, controlled applications of school discipline, such as reprimand or detention. Punishments were given for common school misdemeanors including lateness, smoking, and failure to do work assigned.
Findings: No significant differences were detected between the effects of reprimand and detention. It is expected that information gathered from this study of punishment in a "trivial" context will facilitate the establishment of experimental research on the effect of various types of punishment in penal institutions and magistrates' courts.
Duration: 1964-1966.
Investigator(s): J. W. Palmer, Department of Clinical Epidemiology and Social Medicine, St. Thomas' Hospital Medical School, London, S.E. 1, England. (Reported in the section "Current Projects" of the *International*

Bibliography on Crime and Delinquency, June 1966.)
Cooperating group(s): Epidemiological Research Unit, Medical Research Council, South Wales.

Achievement, aptitude, and school adjustment

20-OM-1 IMPROVING ACADEMIC ACHIEVEMENT THROUGH STUDENTS' SELF-CONCEPT ENHANCEMENT

Purpose: To attempt, in three experiments, to modify students' self-concept of ability in school; to determine whether such changes in self-concept are related to improved achievement; and to study, longitudinally, the relationship between self-concept, expectations of significant others, and achievement. Continuation study to determine long-range effect of experimental treatments.
Subjects: Random samples of low-achieving ninth grade students, and 800 students followed from 7th through 12th grade.
Methods: Three experimental designs with control and placebo groups: before-and-after treatment, questionnaire and achievement information gathered. Yearly questionnaire and school data gathered on longitudinal group. Statistical analysis uses correlation, analysis of variance, and Chi-square. Delayed effect of experimental treatments is tested by analysis of continued change in intervening and dependent variables and tests of difference between experimental and comparable non-experimental groups.
Findings: Though two experiments did not succeed, one, involving the parents of low-achieving ninth grade students in a special program, did have an effect on the child's self-concept of ability, which was reflected in the grade point average of the group at the end of one year. Changes in self-concept are reflected in changes in achievement. Also self-concept of ability is derived from significant others, a limiting factor in achievement, and intervenes between evaluations of others and performance.
Duration: 1963-August 1966.
Investigator(s): Wilbur B. Brookover, Ph.D., Director, Social Science Teaching Institute; Edsel L. Erickson, Ed.D., Professor of Teacher Education and Sociology, Western Michigan University, Kalamazoo; Jean M. LePere, Ph.D., and Don E. Hamachek, Ph.D., Michigan State University, Lansing Mich.; Shailer Thomas, Ph.D., Assistant Professor of Sociology, Ohio State University, 1775 S. College Rd., Columbus, Ohio 43210.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: A monograph of full study and articles on selected aspects of the findings; Improvement of Academic Achievement Through Students' Self-Concept Enhancement, III, Bureau of Educational Research Services, Michigan State University, was to have been published in September 1966.

20-OM-2 PROJECT TALENT ONE-YEAR FOLLOW-UP STUDIES

Purpose: To determine post-high school activities of young people originally tested in 1960 when they were in high school; to relate this information to data collected from these same young people in 1960. These relationships aid in the preparation of a comprehensive counseling guide indicating patterns of aptitudes and abilities which are predictive of success in various work and educational experiences.
Subjects: A probability sample of entire high school population in spring

of 1960. Report is based on the young people from this sample who responded to the mailed questionnaire and approximately five percent of nonrespondents who were contacted through field surveys.
Methods: After data collected from mailed questionnaires and nonrespondent questionnaires had been coded, punched onto cards, and transferred to magnetic tapes, methods of multivariate analysis were generally used to relate data collected in 1960 to follow-up data.
Findings: Results of this study have provided evidence of the predictive validity of the TALENT variables for membership in various post-high school occupational, educational, and career-plan groups.
Duration: May 1963-August 1965.
Investigator(s): John C. Flanagan, Ph.D., and William W. Cooley, Ed.D., Project TALENT, 135 N. Bellefield Ave., Pittsburgh, Pa. 15213.
Cooperating group(s): University of Pittsburgh; Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Project TALENT One-Year Follow-Up Studies to be available in June 1966 from Project TALENT.

20-OM-3 GROUP PROCEDURES FOR ASSISTING MALADAPTED CHILDREN, GRADES FIVE TO SEVEN

Purpose: To assist maladapted children to develop better relationships to classroom work, and improve achievement and adjustment.
Subjects: Currently, all the fifth, sixth, and seventh grade children in the Laboratory School of the University of Chicago. Eventually, all the children in the same grades in a "culturally disadvantaged" school.
Methods: Assessment battery to select normals, controls, and maladapted subjects; division of maladapteds into four-man groups, on basis of grouping principles developed in this Laboratory over the years; assignment of tasks to these leaderless four-man groups; recording; analysis of recording to see how to change the task for the next session; re-assessment at end of year to evaluate treatment.
Duration: February 1965-January 1970.
Investigator(s): Herbert A. Thelen, Ph.D., Professor of Educational Psychology, University of Chicago, 5835 S. Kimbark Ave., Chicago, Ill. 60637.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Articles in process; book or monograph planned.

20-OM-4 IMPULSE CONTROL AND ANXIETY RELATED TO SCHOOL ADJUSTMENT AND ACADEMIC ACHIEVEMENT AMONG HIGH SCHOOL MALES

Purpose: To determine the value of psychometric measures of impulsiveness and anxiety for predicting potential disciplinary problems, including dropouts, among high school males.
Subjects: Sophomore male high school students.
Methods: Predictor tests, including intelligence tests, study habit inventories, need for achievement questionnaires, and standardized and experimental personality inventories; criterion measures, including teacher ratings, disciplinary problems (school and community), and grades.
Duration: January-December 1966.
Investigator(s): Ernest S. Barratt, Ph.D., Research Professor, Department of Neurology and Psychiatry, Medical Branch, University of Texas, Galveston, Tex. 77551.
Cooperating group(s): Galveston schools; Office of Education, U. S. Department of Health, Education, and Welfare.

20-OM-5 A PRELIMINARY EVALUATION OF NURSERY SCHOOL EXPERIENCE ON THE LATER SCHOOL ADJUSTMENT OF CULTURALLY DISADVANTAGED CHILDREN

Purpose: To provide pilot data on relationship between preschool experience and early school adjustment of culturally disadvantaged children.
Subjects: 42 first, 43 second, and 32 third grade, low socio-economic status children, some of whom had attended a day care nursery, the public school's kindergarten, or had no preschooling.
Methods: Evaluations were made in two-way analysis of variance designs (grade level x preschool experience) for intelligence (CTMM, Short Form), reading and arithmetic achievement (CAT), report card grades, teacher ratings of personal-social adjustment, as well as other measures. A number of background variables were also studied.
Findings: Data indicated that children with preschooling were doing better in school than children with no preschooling, especially in reading and arithmetic achievement. There were no statistically significant differences between them on measures used. Sex, within-group socio-economic level, and size of family were related to school performance.
Duration: September 1965-March 1966.
Investigator(s): Kenneth M. Goldstein, Ph.D., Research Psychologist, and Sherwood B. Chorost, Ph.D., Director of Psychological Services and Psychology Training Program, Wakoff Research Center, Staten Island Mental Health Society, 657 Castleton Ave., Staten Island, N. Y. 10301.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: In *Proceedings of the 74th Annual Convention of the American Psychological Association, 1966*. Washington, D. C.: American Psychological Association, 1966. In press.

20-OM-6 EFFECT OF TRIMESTER SCHOOL OPERATION ON THE ACHIEVEMENT AND ADJUSTMENT OF KINDERGARTEN AND FIRST THROUGH THIRD GRADE CHILDREN

Purpose: To compare achievement and adjustment of young children who attend school for regular school year with those who attend the same school an extra 35 days each year.
Subjects: Approximately 100 kindergarten and first through third grade children in school attendance in regular program an extra 35 days each year; and a matched group of children who attend only regular school year.
Methods: A three-year before-and-after design is used. Hammond-Skipper Preschool Achievement Rating Schedule, California Test of Achievement, and Developmental Reading Tests are used to measure achievement; Haggerty-Olson-Wickman Behavior Schedules and California Test of Personality to measure adjustment; and California Test of Mental Maturity to measure intelligence. Intelligence is controlled by a covariance technique and an analysis of covariance design employed to test significance of various relationships.
Duration: July 1963-December 1967.
Investigator(s): Ralph L. Witherspoon, Ph.D., Professor and Director, Institute of Human Development, Florida State University, Tallahassee, Fla. 32306.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-OM-7 IDENTIFICATION AND DEFINITION OF SUBJECT-MATTER CONTENT VARIABLES RELATED TO HUMAN APTITUDES

Purpose: To define form-of-content variable and to measure form-of-content characteristics of instructional material; to manipulate form-of-content in especially prepared, parallel, instructional materials and to study the relationship of ability patterns to achievement on these materials.
Methods: Analysis and definition of form-of-content variable is based upon a priori conceptions, consultation, and analysis of selected textual materials. Subject matter specialists in science and mathematics education, research specialists, and educational psychologists assist in analyses of existing materials and in preparation of experimental materials. High school students whose cognitive aptitude patterns have been assessed are subjects for testing of effect on achievement of congruence of ability patterns and form-of-content.
Duration: Not reported-January 1967.
Investigator(s): Russel P. Kropp, Ed.D., Professor of Educational Research and Testing and Director, Institute of Human Learning; and Willard H. Nelson, Ph.D., Associate Professor of Psychology and Education, Florida State University, Tallahassee, Fla. 32306.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-OM-8 THE SCHOOLING CAREERS OF MILITARY DEPENDENTS: A SOCIOCULTURAL STUDY

Purpose: To compare military dependents and local pupils with regard to their academic achievement, modes of participation, friendship patterns, and attitudes towards self and school.
Subjects: 900 children in 30 sixth grade classes, 15 classes where military dependents constitute entire classroom enrollment, a majority, or a minority; and 15 where local pupils are similarly distributed.
Methods: Classroom observation; sociometric, self-attitude, and standardized achievement testing, open-ended interviews with a stratified random sample of 200 local and migrant pupils, and with their teachers, counselors, principals, and parents, both at beginning and end of school year.
Duration: July 1964-July 1967.
Investigator(s): Herold C. Hunt, Ed.D., Eliot Professor of Education, Graduate School of Education; Bud B. Khleif, Ph.D., Research Associate; and Vincent F. Conroy, Executive Director, Center for Field Studies, Harvard University, Cambridge, Mass. 02138.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-OM-9 EFFECTS OF GEOGRAPHIC MOBILITY ON PERFORMANCE IN HIGH SCHOOL

Purpose: To determine relationships between gross mobility and rank in class, scholastic achievement test scores, and participation in extracurricular activities; to study relationships between patterns of mobility.
Subjects: 2,000 pupils drawn from a pool of 3,000 senior boys and girls, requirements for inclusion being father or stepfather living at home, and enrollment in present school since beginning of 11th grade.
Methods: Sources of data are standardized intelligence and achievement test scores, school yearbooks, pupil questionnaire on education and occupation of father, and places of previous family residence, a scale of residence property values for the district, and a scale for rating extracurricular activities in terms of demands on time, effort, and ability.

Boys and girls are treated separately in all comparisons.
Duration: January 1965-June 1966.
Investigator(s): Harry R. Moore, Ed.D., Professor of Education, University of Denver, Denver, Colo. 80210.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-OM-10 TO BETTER IDENTIFY AND UNDERSTAND HIGH SCHOOL FAILURES

Purpose: To better predict and understand the nature of high school failure by using a specific configural predictive model which combines sociological and psychological information in different ways; to discover sociological variables on the basis of which high school boys may be separated into subsamples differing with respect to the relative weight that different psychological characteristics have in relation to failure; and to construct predictor and "moderator" scales from items of a questionnaire and to develop empirically a configural prediction of failure.
Methods: Questionnaire used to obtain information.
Duration: June-December 1964.
Investigator(s): Kenneth Polk, Ph.D., Research Director, Lane County Youth Project, and Assistant Professor of Sociology, and G. Rolfe LaForge, Ph.D., Research Associate, Department of Psychology, University of Oregon, Eugene, Oreg. 97403.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-OM-11 AN EDUCATIONAL ACHIEVEMENT PROFILE OF CHILDREN GRADES ONE TO SIX: INTERRELATIONSHIPS OF COGNITIVE, SOCIO-PERSONAL, AND PSYCHOMOTOR FACTORS

Purpose: To determine whether there is evidence of interrelationships among cognitive, socio-personal, and psychomotor factors in elementary school children, and if so, to deduct implications for curriculum planning and development.
Subjects: 1,500 boys and girls, grades one to six in the Pontiac, Michigan Public Schools.
Methods: Experimental-Control, based on economic level and school population. Test battery of academic, social, anthropometric and motor performance given at beginning and end of school year.
Findings: Relationships exist within specific areas (e.g., anthropometric) and between areas (e.g., academic and anthropometric). Some common interrelationships were noted in most age groups. Academic achievement measures were most closely related to other measures in the order of bone measurements, emotional stability, and motor performance measures. Clusters were identified.
Duration: September 1963-May 1964.
Investigator(s): Jean M. Young, Ph.D., Coordinator, Research and Evaluation, Pontiac Public Schools, 350 Wide Track Dr., East, Pontiac, Mich.
Cooperating group(s): Human Energy Research Laboratory, Michigan State University.
Publication: Ph.D. Thesis, College of Education, Michigan State University, June 1965.

20-OP-1 PREKINDERGARTEN SCREENING IN SCHOOL ATTENDANCE AREAS WITH HIGH CONCENTRATIONS OF CHILDREN FROM LOW INCOME FAMILIES

Purpose: To provide systematic approach to introducing children to their initial school experience; and to assess the readiness level of children scheduled to enter kindergarten in fall of 1966.
Subjects: Preschool children largely from low income families.
Methods: Home Interviews: Child's home is visited by a trained social worker and an interview schedule completed focusing on readiness level of child. Summer Preschool Activity: Children are invited to participate in a summer activity which, while being school-like in nature, is designed to allow teachers to observe behavior of children in a variety of situations. Profile Completion: A record of the Home Interview and the Summer Activity Observations are combined into a profile of each child.
Duration: March-August 1966.
Investigator(s): Marcus C. Betwee, M.A., Director, Special Services, and Thomas R. Sparrow, M.A., Coordinator, Special Government Programs, Wyandotte Public Schools, 639 Oak St., Wyandotte, Mich. 48192.
Cooperating group(s): Merrill-Palmer Institute of Human Development and Family Life.

20-OP-2 PRESCHOOL EXPERIENCE OF KINDERGARTEN CHILDREN AND LANGUAGE FACILITY

Purpose: To test relationship between quality and quantity of preschool experiential background and oral language facility; to discover possible relationships between sex, intelligence, and print environment, and the oral language of kindergarten children.
Subjects: 49 kindergarten children from three elementary schools selected at random in southwest, suburban Los Angeles County, California.
Methods: The sample, equated on seven variables, was administered the Peabody Picture Vocabulary Test and the Pre-School Experience Inventory (developed by the investigator). Through personal interviews, language samples were taped, transcribed, and evaluated using criteria developed by Loban, Strickland, and others. Sample was divided into a "rich" preschool experience group and a "poor" preschool experience group. Results of the four measures were dichotomized, and data were processed using Chi-square test of significance.
Findings: No significant relationships were evident between preschool experience, sex, or print environment and oral language facility in the population studied, but the above-the-mean intelligence subjects exhibited greater oral language facility, significant at the .05 level.
Duration: February-July 1966.
Investigator(s): Roderick McDaniel, Ed.D., Curriculum Consultant and Educational Materials Administrator, Torrance Unified School District, 2335 Plaza Del Amo, Torrance, Calif. 90501.
Cooperating group(s): University of Southern California, Los Angeles.
Publication: Dissertation available from University Microfilms, Ann Arbor, Michigan; Abstract in Dissertation Abstracts.

20-OS-1 THE RELATIONSHIP OF SEX GROUPING TO CLASSROOM PERFORMANCE

Purpose: To compare the effects of alternate coeducational and noncoeducational grouping on classroom performance of fourth grade Negro ghetto pupils over a period of one semester; to secure empirical data relevant to hypotheses identification as a step toward developing a sophisticated research design.

BEST COPY AVAILABLE

Subjects: 22 boys and 30 girls ages 8 to 12, with nine- and 10-year olds composing 88 percent of the sample.
Methods: During the four months, the two classes were alternately grouped by sex. The Haggerty-Olson-Wickman Behavior Rating Schedule B was used twice a month during first and fourth weeks. Teachers rated the children on Schedule B which consisted of a graphic rating scale for each of 35 intellectual, physical, social, and emotional traits. Below the scale for each trait appear five descriptive phrases to assist the rater in making a quantitative judgment. Statistical analysis was made in terms of comparing the mixed to the separated groups. Significance of the difference of the means of two correlated groups formulae was used.
Findings: The t test seemed to indicate that the girls did better in a separated group in the subtests of physical and social. This seemed especially true during the first three months of the experiment. Intellectual and emotional traits as a whole did not seem to be affected. Boys seemed to do better in a separated group in the physical subtest, especially in the first three months of the experiment. Boys seemed to do better socially in mixed groups during the first three months of the experiment but better in the last month of the test in a separated group. Once again, intellectual and emotional traits as a whole were not affected. The F test, however, indicated that the test as a whole was not significant.
Duration: January-June 1965.
Investigator(s): Joseph Caliguri, Ph.D., Special Coordinator, Equal Educational Opportunities In-Service Program, Clark County School District, P.O. Box 551, Las Vegas, Nev. 89101.
Publication: Project will be written in article form for publication in suitable journal.

20-OS-2 SCHOLASTIC CONSEQUENCES OF PARTICIPATION IN HIGH SCHOOL SPORTS

Purpose: To ascertain extent to which athletic participation facilitates or impedes scholastic attainment among high school boys.
Subjects: All boys who enrolled in two midwestern high schools as tenth graders in the fall of 1961.
Methods: Matched sample of athletes and non-athletes (matched on social class, I.Q., curriculum location, ninth grade course marks) are compared as to their change in grade point average between ninth and later grades.
Duration: November 1965-summer 1966.
Investigator(s): Walter E. Schafer, Ph.D., and J. Michael Armer, Ph.D., Assistant Professors of Sociology, University of Oregon, Eugene, Oreg.
Cooperating group(s): Office of Scientific and Scholarly Research of the Graduate School of the University of Oregon.
Publication: Possibly in an educational journal.

20-OS-3 RELATIONSHIP OF EMOTIONAL INDICATORS ON HUMAN FIGURE DRAWINGS AND LEARNING PROBLEMS IN CHILDREN AGED FIVE TO 10

Purpose: To determine whether any specific emotional indicators on HFD's are related to learning problems and can be used as predictors for school achievement in the primary grades.
Subjects: 180 good pupils and 133 poor pupils, ages five to 10, attending regular classes Kindergarten through fourth grade, and 78 special class pupils who had learning difficulties and emotional problems despite normal I.Q.
Methods: Human Figure Drawing test was administered at beginning of

school year to all pupils in 23 classes and in special classes. At end of year good and poor students were designated by means of Average Achievement on the Metropolitan Achievement Test. HFD's of good and poor and special class pupils were compared for presence of 30 signs on HFD's which were known to differentiate between subjects with and without emotional problems.
Findings: Six signs occurred significantly more often on HFD's of poor pupils Kindergarten to second grade; none differentiated HFD's in grades three and four. 13 signs differentiated HFD's of special class pupils and good students; six of these were related to school achievement, and seven reflected emotional problems primarily. Six signs can be used to predict learning problems in school beginners.
Duration: Summer 1963-summer 1966.
Investigator(s): Elizabeth M. Koppitz, Ph.D., Psychologist, Board of Cooperative Educational Services, Yorktown Heights, N. Y.
Publication: Article planned for *Journal of Clinical Psychology*.

20-OS-4 SEPARATION OF THE SEXES IN GRADES ONE TO THREE

Purpose: To create educational interest and reduce emotional problems, especially among boys, by separating children in first three grades for academic work.
Subjects: 200 boys and girls in Duval County, Florida, already tested; and 450 boys and girls (150 in each grade for three grades) from first three grades of the Hammond, Louisiana, elementary schools.
Methods: Curricula have been and are being devised for express purpose of maintaining interests of each sex in educational materials and program. Pre- and post-testing on the Behavioral Classification Project behavior problem items, preschool readiness, and post-academic year achievement tests are being utilized.
Findings: Present results suggest that increased achievement and decreased behavioral problem incidents occur at least in the first grade.
Duration: August 1962-June 1968.
Investigator(s): Ralph Mason Dreger, Ph.D., Professor of Psychology, Louisiana State University, Baton Rouge, La. 70803.
Cooperating group(s): Duval County, Florida, school system; Hammond, Louisiana, school system; Florida Council on Training and Research in Mental Health.
Publication: *Scholastic Teacher* (in press); further publication will be in either the *Journal of Educational Psychology* or one of the elementary school journals.

20-OS-5 TRAITS OF SCHOOL ACHIEVERS FROM A DEPRIVED BACKGROUND

Purpose: To identify characteristics of successful school achievers among Negro children from a deprived environment; to test hypothesis that caution and control, need for achievement, self-confidence, positive attitudes towards authority, little anxiety, accuracy and critical ability, good memory, verbal skills, and healthy physique are associated with successful school achievement.
Subjects: 140 fifth graders, attending schools in slum areas, selected on basis of school achievement, half achieving at grade level, half two years below grade level.
Methods: Measurement of cognitive, affective, physical and social correlates of achievement, using objective and projective tests, rating scales, and family interviews.

Duration: September 1964-January 1967.
Investigator(s): Helen H. Davidson, Ph.D., Associate Professor, and Judith W. Greenberg, M.S., Instructor, School of Education, City College of the City University of New York, Convent Ave. at 139th St., New York, N. Y. 10031.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-OS-6 REMINISCENCE AS A MEASURE OF EDUCATIONAL MOTIVATION

Purpose: To investigate whether a reminiscence difference holds for high school students of varying academic motivation. Reminiscence is defined as the increase in performance after a rest period.
Subjects: 104 senior males from a suburban Minneapolis high school - 52 overachievers (high motivation) and 52 underachievers (low motivation).
Methods: Subjects are given pursuit task, involving eye-hand coordination in following a moving target. Each subject is tested for eight straight minutes, rests for 10 minutes, and tested for one minute. Reminiscence score is taken as difference in performance between 10-second period before rest and 10-second period after rest.
Findings: Tended to support proposal that reminiscence is related positively to level of motivation.
Investigator(s): Douglas G. Sprague, M.A., Counseling Psychologist, 1220 Walpert St. No. 30, Hayward, Calif. 94541.
Cooperating group(s): Veterans Administration.

20-OV-1 MEASURES OF CHILD INVOLVEMENT IN AND ALIENATION FROM THE SCHOOL PROGRAM

Purpose: To assess the validity of measures of alienation, and to obtain information about how high school students orient to the school organization.
Subjects: 50 interview respondents in one high school, plus 2,500 questionnaire respondents in two additional high schools.
Methods: Interview and questionnaire.
Duration: June 1965-May 1966.
Investigator(s): Booth Buford Rhea, Jr., Ph.D., and Robert G. Williams, M.A., Assistant Professors of Sociology; and Richard A. Minisce, B.A., Instructor in Sociology, Boston College, Chestnut Hill, Mass. 02167.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Final report to Office of Education, May 1966.

20-OV-2 CHANGING CLASSROOM PEER RELATIONS AND STANDARDS IN GRADES FOUR, FIVE, AND SIX

Purpose: To discover teaching practices that lead to changes in the centrality of sociometric choices to a more diffuse distribution of choices, and changes in group standards that inhibit positive mental health and achievement to standards which tend to enhance them.
Subjects: An experimental group of 20 teachers and their pupils; a control group of 20 teachers and their pupils; and a second control group of 10 teachers and their pupils.
Methods: Teachers attend workshop on classroom peer processes. One

control group attends only fall seminars along with experimental group. Second control group receives no special training. Fall and spring classroom measures are gathered along with historical records on classroom practices tried by each teacher. Change analysis is carried out on these data.
Duration: September 1964-June 1967.
Investigator(s): Richard Schmuck, Ph.D., Associate Professor of Educational Psychology, Group Dynamics Center, Temple University, Philadelphia, Pa.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Data and results to be published in final report to the Office of Education; articles to be published describing the results.

20-OV-3 CLASSROOM TEACHING AND LEARNING AS A COMPLEX INTERACTIONAL GAME

Purpose: An exploratory study of interpersonal "ground rules" and "games" through which teaching and learning proceed in inner city, suburban, and rural elementary school classrooms, to permit identification and classification of implicit and explicit "rules" as established and reciprocally communicated by teachers and pupils in varied settings; to illuminate significant elements of teaching method and classroom behavior, suggest more effective teaching and intervention techniques, and serve as a source of more specific hypotheses about parameters of school interaction.
Methods: Observation of selected classrooms in several kinds of elementary schools throughout school year to obtain anecdotal material to serve as basis for interviews with classroom participants and others to permit a deeper exploration of perceptions and interpretations of classroom life; analytic induction, critical incident technique, and psychological ecology may be adapted to systematize data so that interactional commonalities and contrasts among various types of classrooms can be identified.
Duration: 1964-1966.
Investigator(s): Jerome Beker, Ed.D., Senior Research Associate, Youth Development Center, Syracuse University, 926 S. Crouse Ave., Syracuse, N. Y. 13210.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-OY-1 THE EFFECTS OF INDIVIDUAL COUNSELING, MULTIPLE COUNSELING, AND TEACHER GUIDANCE UPON THE SOCIOMETRIC STATUS OF CHILDREN ENROLLED IN GRADES FOUR, FIVE, AND SIX

Purpose: To determine the effectiveness of selected guidance techniques.
Subjects: Students in grades four, five, and six in four schools in a midwestern community of 31,000.
Methods: Subjects were pretested to identify those with sociometric scores in the lower 50 percentile. Subjects were randomly assigned to various treatment conditions including control. Following treatment, subjects were retested and statistical treatment of data conducted. Gain score in sociometric status served as criterion measure.
Findings: No significant differences were found among various techniques used or between different levels of social class of subjects in the study.
Duration: January-June 1965.
Investigator(s): Frank Biasco, Ed.D., Assistant Professor, School of Education, Indiana University, Bloomington, Ind. 47405.
Cooperating group(s): Indiana University; Bloomington Metropolitan School System; Director of Pupil Personnel Services, Indiana State Department of

Education.
Publication: Available through Studies in Education 1965, School of Education, Indiana University, $1.50 per copy; also Library Microfilms, University of Michigan, Ann Arbor, Mich.

20-OY-2 ADOLESCENT STUDY UNIT

Purpose: To discover means by which underachieving students may be enabled to achieve a more adequate total integration with their environment.
Subjects: Underachieving students identified by school personnel as having adjustment problems.
Methods: Child and parent are referred to Adolescent Study Unit for evaluation. Data collection includes school history, personal and family history, battery of psychological tests, and psychiatric interviewing.
Duration: October 1965-not reported.
Investigator(s): Benjamin Sher, M.D., Chief, Psychiatric Inpatient Services, Ben Taub General Hospital, Houston, Tex. (Reported by Ralph Anderson, Counselor, Pershing Junior High School, 7000 Braes Blvd., Houston, Tex. 77035.)
Cooperating group(s): Baylor University School of Medicine.

20-OY-3 A COHORT STUDY OF SCHOOL WITHDRAWALS WITH IMPLICATIONS FOR MENTAL HEALTH

Purpose: Operating on the premise that school withdrawals constitute a risk group from a mental health viewpoint, to make a brief background study of the extent of, and reasons for, withdrawal of students in a given generation or cohort, from a predominately rural county school system; to explore program implications of different modes of withdrawals which occur within a particular school system.
Subjects: All white students who were at one time or another members of the class which began first grade in 1946 and graduated in 1958; total population of cohort consisted of 646 students; of these, 281 were enrolled in first grade at start of study in 1946-47; the remainder, 365 students, joined the class at various points between first and twelfth grades.
Methods: Subjects were followed over a twelve-year period. Each time a withdrawal was recorded on the school record card, it was noted and recorded on a tally sheet. In this manner the outcome of all but 130 students was accounted for. This latter group simply disappeared in the records. Usually the disappearance occurred between the end of the second semester of one year and the beginning of the first semester of the following year. It is suspected that most of these students either moved out of the county during the summer months or in the case of those students sixteen years and over, dropped out of school.
Findings: Five specific withdrawal groups were identified, and time points at which withdrawal was most likely to occur were located. On the basis of certain background information it was possible to predict in advance students who were most apt to withdraw and the form the withdrawal would take.
Duration: 1958-June 1966.
Investigator(s): Fortune V. Mannino, Ph.D., Director of Consultation Services, Mental Health Study Center, National Institute of Mental Health, 2340 University Blvd., East, Adelphi, Md. 20783.
Publication: To be published in Community Mental Health Journal about June 1966.

20-OY-4 AN EVALUATION OF THE EFFECTIVENESS AND EFFICIENCY OF GROUP AND INDIVIDUAL COUNSELING WITH ISOLATED ADOLESCENTS

Purpose: To see if group counseling can be effective and efficient in helping adolescents who are not well-liked by their classmates.
Subjects: Isolates from 10 to 12 classrooms in each of five secondary schools in Tennessee, New York, Minnesota, and Wisconsin.
Methods: Pre-, post-, and follow-up-testing of reputation with sociometric question included, and self-concept scale; group and individual counseling with experimental and control groups; analysis of total groups by testing and by counselor looking for changes in group acceptance and self-acceptance.
Findings: Reputation test and sociometric question show reliability with adolescents. Adolescents can differentiate between personality characteristic more definitively than younger groups previously using the reputation tests according to factor analysis.
Duration: November 1964-August 1966.
Investigator(s): Clarence J. Dunkleberger, M.S., School Psychologist, Norwich Central Schools, Norwich, N. Y.
Cooperating group(s): Norwich (N.Y.) Central Schools; Montevideo (Minn.) Public Schools; Nashville (Tenn.) Public Schools; Waterville (N.Y.) Central Schools.
Publication: Will publish results of various aspects in several journals.

20-OY-5 A GRADED PROGRAM OF AFTER-SCHOOL VOCATIONAL TRAINING TO KEEP POTENTIAL DROPOUTS IN SCHOOL

Purpose: To discover methods for helping low income and emotionally disturbed adolescents, borderline dropouts, remain in school through a program combining after-school work experiences and group and individual counseling; to prevent further alienation from society; and to compare individual and family characteristics of dropouts and non-dropouts.
Subjects: 50 14- to 16-year olds per year from one junior high school.
Methods: Subjects are provided with after-school paid work experiences for 10 to 12 hours per week for 40 weeks--one school year only. Experiences include supervised work assignments in neighboring settlement houses, such as maintenance, clerical and group assistant leadership capacities, positions in industry and retailing, etc. Adequate evaluation is included.
Duration: Not reported-1970.
Investigator(s): Daniel R. Rubenstein, The Educational Alliance, 197 E. Broadway, New York, N. Y. 10002.
Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.

20-OY-6 PREDICTION OF DROPOUTS AMONG URBAN NEGRO HIGH SCHOOL BOYS

Purpose: To test impact of certain factors of Negro pupil's life organization upon dropout behavior, and to assess power of these factors to predict behavior.
Subjects: 500 Negro high school boys who registered at seventh grade in fall term of 1957, but are known not to have registered in any school for spring term of 1963; and 500 who registered for each intervening semester period.
Methods: Retesting older models of relationship between cultural experiences and social success by isolating complexes of independent

variables and testing their association with dropout behavior as expressed by Negro pupils; identifying most critical factors which accurately distinguish dropouts from those who stay in school; and extending a method of prediction through development of prognostic tables by which potential dropouts can be accurately identified before their withdrawal from school. Factors derived from an interview schedule and significantly associated with dropout behavior form basis for prognostic tables.
Duration: July 1964-June 1967.
Investigator(s): Henry A. Bullock, Ph.D., Professor of Sociology, Texas Southern University, 3201 Wheeler Ave., Houston, Tex. 77004.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-OY-7 EFFECTS OF A SUMMER COUNSELING PROGRAM WITH POTENTIAL DROPOUTS

Purpose: To determine what effects, if any, a summer counseling program has on subsequent behavior of several different types of potential dropouts.
Subjects: Potential dropouts divided into three groups: those who are counseled with their parents or guardians; those who are counseled, but not with parents or guardians; and a control group which does not participate in any summer counseling.
Methods: Collection of data on: number returning to school; number persisting in school subsequent year; comparison of grade point averages for school year preceding summer counseling and school year following it; attendance before and after summer counseling; and frequency of disciplinary cases among groups after summer counseling.
Duration: 1964-1965.
Investigator(s): Dwight Safar (formerly) Director of Guidance, Wyoming State Department of Education, Capitol Building, Cheyenne, Wyo. (Reported by Walter Reusser, Wyoming State Department of Education.)
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-OY-8 DROPOUT OF AMERICAN INDIANS AT THE SECONDARY LEVEL

Purpose: To analyze and describe social situation and process underlying poor academic achievement and high rate of dropout among Sioux Indians of high school age; to investigate experiences of dropouts and non-dropouts from impoverished reservation communities.
Subjects: Random sample from among communities of Oglala Sioux of the Pine Ridge Reservation, S. Dak.
Methods: Unstructured interviews, often conducted in native language of Lakota via interpreters, supplemented by sentence completion schedules in English.
Duration: 1964.
Investigator(s): Murray L. Wax, Ph.D., Associate Professor of Sociology, and Rosalie H. Wax, Ph.D., University of Kansas, Lawrence, Kans. 66045.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Final report to Office of Education; mimeographed copies available from United Scholarship Service, Denver, Colo.; Midcontinent American Studies Journal 6:2:164-170, Fall 1965.

Specific skills

20-PA-1 EFFECTS OF A TRAINING PROGRAM FOR TEACHING A MATHEMATICAL CONCEPT TO PRESCHOOLERS

Purpose: To examine effects on cognitive and affective behavior of a training program designed to teach the mathematical concept of one-to-one correspondence to nursery school children.
Subjects: 38 subjects, three, four, and five years old, enrolled in the University Nursery School in spring, 1966.
Methods: General design is a levels by treatment paradigm. The levels variable is chronological age. The treatment variable is type of mathematical experience, a set of specifically designed experiences prepared to teach a mathematical concept, or a set of nursery school experiences generally included in a nursery school program to facilitate mathematical understanding.
Duration: March-October 1966.
Investigator(s): Therry N. Deal, Ph.D., and Fannie Lee Brooke, M.S., Assistant Professors of Child Development, School of Home Economics, University of Georgia, Athens, Ga. 30601.
Cooperating group(s): Research and Development Center in Educational Stimulation, University of Georgia.
Publication: Results available in progress reports of the Research and Development Center.

20-PA-2 DEVELOPMENT OF "MATH ATTITUDES" IN ELEMENTARY AND SECONDARY SCHOOL PUPILS

Purpose: To identify and, if possible, trace the etiology of so-called math attitudes--emotionalized reactions to arithmetic and mathematics--in elementary and secondary school pupils.
Subjects: 30 subjects from each grade, 3 to 12, from whom 40 subjects are drawn from four "math attitudes" levels by stratified random sampling within sexes and grade levels.
Methods: The Math Attitude Scale, Arithmetic and Mathematics Achievement Test, and general anxiety measures (Children's MAS and Taylor MAS) will be administered to subjects. With the subsample of 40 subjects, a general temperament test (CPQ, HSPQ) and self concept measures (Wide Range Self Concept Scale, rated BAP Figures) will be utilized to assess concomitant of "math attitudes."
Duration: February-August 1966.
Investigator(s): Ralph Mason Dreger, Ph.D., Professor of Psychology, and W. Randall Ratliff (Ph.D. Candidate), Louisiana State University, Baton Rouge, La. 70803.
Cooperating group(s): Laboratory School, Louisiana State University.
Publication: Either *Journal of Educational Psychology*, *Journal of Educational Research*, or a similar journal.

20-PD-1 THE EFFECT OF A SUMMER TELEVISION READING PROGRAM ON READING ACHIEVEMENT OF CHILDREN

Purpose: To determine (1) loss in reading that occurs during the summer for children who have just completed first grade, and (2) effect that a

summer television program has on reading achievement.
Subjects: Approximately 3,000 children who completed first grade in the Evansville-Vanderburgh School Corporation in June 1965 and June 1966.
Methods: Subjects are tested in reading achievement before and after summer. For second part of study, special workbooks and summer television teaching program are developed and tested on subjects for a summer, with achievement tests to measure loss or gain as result of the program.
Duration: January 1965-December 1966.
Investigator(s): Jack W. Humphrey, Director of Reading Services, Evansville-Vanderburgh School Corportion, 911 Walnut St., Evansville, Ind. 47713.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Report available from Educational Research Information Center, Office of Education.

20-PD-2 WORD FREQUENCIES IN SPOKEN LANGUAGE OF SIXTH AND TENTH GRADE CHILDREN

Purpose: To compare word frequencies of 3,000 word samples of spoken language (per child) of two different age groups; to inspect a number of word lists and ratios.
Subjects: 15 sixth grade boys and 15 tenth grade boys of normal intelligence from Salt Lake City schools.
Methods: Children were each given a small tape recorder to record spoken language. Recordings were restricted to out-of-school hours and children instructed not to read into recorder nor to make special speeches. Approximately 5,000 words were obtained for each child, and 2,500 of them randomly chosen. These words were put on IBM cards and processed by a computer program, developed by Dr. John A. Starkweather at the University of California. Computer program was also designed to give word lists such as word frequencies of self references (I, me, mine, etc.); other references (you, your, them); negative references (no, none, never); positive references (yes, O.K.) etc. Ratios obtained from this computer program were worked on a correlation matrix and factor analysis related to achievement and other variables.
Duration: June-September 1965.
Investigator(s): Ernst G. Beier, Ph.D., Director of Clinical Training, Department of Psychology, University of Utah, Salt Lake City, Utah.
Cooperating group(s): University of California, San Francisco Medical Center.
Publication: Paper read at Inter-American Congress of Psychology, Lima, Peru, 1966. These results to be included in larger study and compared with spoken language patterns of school dropouts, mentally retarded, and gifted children.

20-PD-3 THE ANALYSIS OF READING SKILL

Purpose: To study basic psychological processes underlying reading, such as perceptual learning and attention; to experiment on search strategy and detection with graphic materials, on decoding spelling patterns to sound, on oral reading representing attempts to externalize process of reading, and on utilization of higher order constraints.
Subjects: First grade pupils.
Methods: Data on first grade reading, gathered by a psychologist and a linguist, are being intensively analyzed to describe development of oral reading, reading and speech styles, and reading errors. Relation of

pictorial perceptions to reading is being explored in experiments rising from hypotheses developed from theory of relation between perception of things and mediated perception of things. Relationship between written and spoken English is being studied, a major question being which of several formal ways of setting forth the morphon-to-letter and morphon-to-phoneme functions is preferable and how this new characterization of relation of written English and spoken English will affect the ordering of pedagogical materials.
Duration: July 1965-June 1968.
Investigator(s): Eleanor J. Gibson, Ph.D., Senior Research Associate, and James J. Gibson, Ph.D., Professor, Psychology Department; Charles F. Hockett, Ph.D., Professor, Departments of Linguistics and Anthropology; and Harry Levin, Ph.D., Professor, Departments of Child Development, Education, and Psychology, Cornell University, Ithaca, N. Y. 14850. (Reported by Nancy Meltzer, Research Associate, Project Literacy, Cornell University.)
Publication: Professional journals.

20-PD-4 VOCALISM IN SILENT READING

Purpose: To determine incidence of implicit speech (lip reading) as manifested during silent reading by two groups of intermediate grade children; and to determine if implicit speech is a desirable, natural, and helpful adjunct of reading and learning, or if it is an undesirable adjunct of reading and learning.
Subjects: A random selection of two groups of reading achievers and reading retardates.
Methods: Correlations on such variables as intelligence, school achievement, socio-economic level, reading grade, etc.
Duration: Not reported-December 1966.
Investigator(s): Donald L. Cleland, Ph.D., Director, Reading Laboratory, University of Pittsburgh; and O. S. Ray, Ph.D., Chief, Psychological Research Laboratories, Veterans Administration Hospital, Leech Farm Rd., Pittsburgh, Pa. 15206.
Cooperating group(s): Veterans Administration.

20-PD-5 IDENTIFICATION OF FACTORS THAT MAKE FOR FUTURE SUCCESS IN READING AND IDENTIFICATION AND DIAGNOSIS OF POTENTIAL READING DISABILITY CASES AMONG KINDERGARTEN CHILDREN

Purpose: To test hypotheses that: (1) factors making for success in reading for individual pupils can be identified in the kindergarten; and (2) potential reading disability cases can be identified and diagnosed in the kindergarten.
Subjects: 300 kindergarten children from high, middle, and low socioeconomic districts of Cheyenne, Wyoming public schools.
Methods: Evaluation of subjects during kindergarten year on variety of traits and characteristics using background, WISC, creativity test, sociometric score, social-emotional rating by teacher, reading readiness rating by teacher, reading and numbers readiness test, and end of first and second grade reading tests.
Duration: Not reported-summer 1968.
Investigator(s): Wilma E. Hirst, Ed.D., Coordinator of Guidance and School Psychologist, School District No. 1, School Administration Building, Cheyen[illegible] Wyo. 82001.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-PD-6 A STUDY IN DEPTH OF FIRST GRADE READING: AN ANALYSIS OF THE INTERACTIONS OF PROFESSED METHODS, TEACHER IMPLEMENTATION, AND CHILD BACKGROUND

Purpose: To explore effect of interactions between published reading program, teacher's implementation and understanding of that program, and varying characteristics of pupils, on various components of reading achievement in first grade.
Subjects: Children from 12 first grade classes in socially disadvantaged neighborhoods in New York City.
Methods: Subjects are evaluated on skills and abilities underlying reading at beginning of school year, and on reading measures at end of school year. In four classes, observations are made on a weekly basis and evaluation done at midyear. In other eight classes, there are four or five classroom observations during school year. Relationships of children's initial skills and abilities, professed methods used, and teacher's implementations of those methods to final reading achievement measures are analyzed.
Duration: Not reported-February 1966.
Investigator(s): Jeanne S. Chall, Ph.D., Associate Professor; Shirley C. Feldmann, Ph.D.; Florence G. Roswell, M.A.; and Gladys Natchez, Ph.D., Assistant Professors, Department of Education, City College of the City University of New York, Convent Ave. at 135th St., New York, N. Y. 10031.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-PD-7 A STUDY OF A LONGITUDINAL FIRST GRADE READING READINESS PROGRAM

Subjects: Pupils of 32 experimental and 32 control classes.
Methods: Following readiness tests, experimental subjects either begin a basal reading program or receive two months of intensive readiness training keyed to needs in areas of visual perception, auditory discrimination, and auditory language skills. All subjects are retested at intervals of two months in both experimental and control classes to determine development in these facets of readiness, as a result of special training or incidental outcomes of a basal reading program. After each retesting, those ready for the basal program enter it; those not ready receive further intensive training. After six months, all subjects in experimental classes enter a reading program. Control classes all enter reading program at appropriate time as determined by teacher judgment, and are retested three times by special tests. Final outcomes are estimated by a variety of oral and silent reading tests.
Duration: September 1964-December 1965.
Investigator(s): George D. Spache, Ph.D., Professor of Education, University of Florida, Gainesville 32601; Hazen A. Curtis, Ed.D., Professo of Education and Head of Educational Research and Testing, Florida State University; and Paul H. Jacobs, Consultant in Language Arts, Florida State Department of Education, Tallahassee, Fla.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-PD-8 TEACHER AND PUPIL ATTITUDE AND PERFORMANCE IN RELATION TO NUMBER OF BOOKS USED IN FIRST GRADE READING

Purpose: To examine teacher attitude and performance and pupil attitude and performance when selected first grade groups represent extremes on a continuum of numbers of books used in the reading program.

Subjects: Contrasting teacher groups of approximately 40 to 50 each and pupil groups matched on several key factors.
Methods: Teacher groups will be identified through a questionnaire study and by rating of supervisors. Examination of each teacher's program will be made through application of appropriately developed measures at the one-third, two-thirds, and terminal points of school years. At same time pupil groups will be studied. Particular teacher and pupil measures will be developed; Teacher Observation, Self-Report and Attitude Scales, and Pupil Attitude measures will be revised and refined; standardized and other recognized measures will also be used.
Duration: 1965-1966.
Investigator(s): Lyman Hunt, Jr., Ed.D., Professor of Education, University of Akron, 302 E. Buchtel Ave., Akron, Ohio 44304.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-PD-9 EXPERIMENTAL USE OF THE "IMPRESS METHOD OF READING HABILITATION"

Purpose: To determine to what degree the reading level of a child with a severe reading problem (at least three years below chronological grade placement) can be raised through the "Impress Method of Reading Habilitation." This method attempts to eliminate "phonetic boundness" and its accompanying tension over failure to read and to establish a feed-back system involving hearing, vision, and speaking implications in terms of the reconditioning of a reading pattern.
Subjects: 49 children from Sonoma County closely matched for sex, I.Q., chronological age, and grade placement.
Methods: A prime control group of nine received no instruction other than that received in regular classroom sessions. Control and experimental groups of 20 students each received ten minutes of individual instruction a day for six weeks, the former using conventional reading techniques. In experimental sessions, instructor and student read in unison at rapid rate, with instructor's voice directed into student's ear. Student was permitted to use his finger as a locator. There was no attempt to teach sounds or word recognition, and each child was given much positive motivation.
Findings: According to the Gates Silent Reading Test, all three groups were at relatively the same reading level at the beginning of the experiment. Post-experimental analysis of reading ability indicated a mean gain of 3.2 (months) by the experimental group, a gain of .2 by the control group, and a loss of .2 by the prime control group. Tests administered three months later showed a consistent gain of .3 months was maintained above the preceding test results by the experimental group.
Duration: November 1964-June 1965.
Investigator(s): Charles Gardner, Ph.D., Guidance Consultant; Reba Sones, Psychologist; Yvonne Black and Vida Santucci, Experimental Reading Teachers, Sonoma County Schools, Santa Rosa, Calif.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-PD-10 THE EFFECT OF SPECIAL INSTRUCTION ON THE ABILITY OF SEVENTH AND EIGHTH GRADE PUPILS TO WRITE COMPOSITION AND UNDERSTAND POETRY AND SHORT FICTION

Purpose: To test hypothesis that students who are taught to analyze their own spoken and written sentences and sentences of representative professional writers by a structural grammar approach, and who are encouraged to create a variety of sentences by a generative grammar approach will

write more mature compositions and will understand poetry and short fiction better.
Subjects: Four seventh grade and four eighth grade classes from a college demonstration school and a public junior high school provide both experimental and control groups.
Methods: Variant forms of standardized tests are given as pre- and post-tests to measure student achievement; samples of student writing are examined before and after study, and an attitude scale taken by students to determine their interest in experimental method and materials; analysis of covariance, factor analytic procedures, and test validation procedures are used in evaluating data of study.
Duration: June 1965-May 1966.
Investigator(s): Robert W. Blake, Professor of Education and Chairman, Department of Secondary Education, and Marion Nestle, Assistant Professor of Education, Demonstration School, State University College, Brockport, N. Y. 14420.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-PG-1 THE DEVELOPMENT OF SPECIALIZED PROGRAMS FOR SINGING IN THE ELEMENTARY SCHOOLS

Purpose: To determine incidence of nonsinging in terms of its acuteness as an adverse effect on task of upgrading musical experiences for elementary school children.
Methods: Examination of various kinds of nonsinging difficulties in wide variety of school situations with children of varying backgrounds, including deprived; development of diagnostic tests to determine causes of nonsinging; classroom observation of remedial techniques used by music supervisors and teachers of elementary music with nonsinging pupils. Resulting procedures for helping nonsingers learn to sing are tested in experiments of 18 weeks duration in 12 classrooms of varying school situations and backgrounds.
Duration: July 1965-June 1968.
Investigator(s): A. Oren Gould, Ed.D., Associate Professor of Music Education, Music Department and Campus School, Western Illinois University, Macomb, Ill. 61455.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-PG-2 MUSICAL ABILITY UTILIZATION: SCREENING AND TEST CONSTRUCTION AND EDUCATIONAL OUTCOMES

Purpose: To develop a standardized test of musical potential so that this ability can be measured; to investigate and evaluate effect of a program for musical development on pupils who are below standard achievement academically and who show good potential in music.
Subjects: Sixth and seventh grade students in special service schools in New York City.
Methods: Subjects are tested in elements of musical ability; data on this and previous aptitude testing and music performance are used to achieve good measurement methods. Test-retest and methods of correlation furnish reliability; validity is approached by retrospective correlation of aptitude measurements and performance. Randomly selected equated groups with equivalent musical potential are assigned to participation or nonparticipation in music program. Music instruction is given during class

time. For three-year period of music program, multiple analysis and comparison techniques are used to evaluate effects of program.
Investigator(s): Joseph O. Loretan, Deputy Superintendent of Schools, Board of Education of the City of New York, 110 Livingston St., Brooklyn, N. Y. 11201.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-PG-3 A COMPARISON OF THE DEVELOPMENTAL DRAWING CHARACTERISTICS OF CULTURALLY ADVANTAGED AND CULTURALLY DISADVANTAGED CHILDREN

Purpose: To develop a scale for assessing the treatment of space and esthetic quality in children's drawing and then to identify differences, if any, among the drawings made by children in each of the two populations.
Subjects: 200 children from each of four grades (one, three, five, and seven), a total of 800 children, selected from middle class suburban communities and slum communities; half of the children are Negro, and half are white; middle and lower classes are equally represented in both racial groups.
Methods: All subjects are asked to make drawings under standardized conditions.
Duration: Not reported-December 1966.
Investigator(s): Elliot W. Eisner, Associate Professor of Art Education, School of Education, Stanford University, Stanford, Calif.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-PG-4 AN EXPERIMENTAL STUDY OF PARENT PARTICIPATION AS AN AID TO THE CHILD'S LEARNING

Purpose: To determine whether parent participation could be of value in child's learning of school subject matter (elementary science) when parent cannot view televised instruction offered in school. It was hypothesized that: (1) children of parents who volunteered to help with study of science at home and who were given basic science materials would perform better on a science achievement test than children of parents who volunteered to help but who did not receive materials; (2) children of volunteering parents who did not receive materials would perform better on a science achievement test than children of nonvolunteering parents.
Subjects: 276 fourth, fifth, and sixth grade pupils in 11 classes from 8 schools within Santa Clara County, California.
Methods: Analysis of covariance was used to test overall significance of differences between groups; adjusted group means were also compared. Pretest score and I.Q. were used as covariates. In addition, a random sample of 104 volunteer parents was interviewed in order to obtain information related to children's performance on tests of achievement in science. A random sample of 43 nonvolunteers was also interviewed to determine pertinent differences between parent groups who selected themselves to experimental conditions (design controls for self-selection). Differences between volunteer and nonvolunteer groups were tested by Chi-square.
Findings: Hypothesis (1) was not supported; hypothesis (2) was supported at high statistical level. Materials provided for volunteering parents appeared to be irrelevant to performance of their children when comparisons were made with performance of children whose parents did not volunteer. Differences between parent groups appeared to be attributable largely to

education and its implications for approaches to available time and sources of information.
Duration: June-July 1965.
Investigator(s): Donald W. Johnson, Ed.D., Consultant, Bureau of NDEA, California State Department of Education, 721 Capitol Mall, Sacramento 95814; Warren L. Wade, Ed.D., Station Manager, KTEH, Channel 54, Office of Education, County of Santa Clara; and Serena E. Wade, Ph.D., Research Associate, County Office of Education, 70 W. Hedding St., San Jose, Calif.
Cooperating group(s): Santa Clara County Office of Education; California State Department of Education; Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Publication planned in educational research journal; final report to Office of Education.

Special education

20-QA-1 DEMONSTRATION OF THE SIGNIFICANCE OF A CONSULTANT-TEACHER FOR THE GIFTED TO A SMALL RURAL SECONDARY SCHOOL

Purpose: To learn effect, significance, and importance of a trained gifted-teacher-consultant in the education of gifted students in a small secondary school; to establish and evaluate such a program within the Kansas education system.
Subjects: 20 students ages 13.5 to 17 ranging in I. Q. from 119 to 150.
Methods: The secondary program for the gifted is developed within the framework of two definite types of administrative organizations:
(1) special grouping of gifted students for seminar-type instruction, and
(2) enrichment program for gifted students in heterogeneous classes of the regular secondary curriculum. Basic curriculum is one of scientific inquiry, utilizing local resources of industry and social sciences. Evaluation of program is subjective and related to "before and after" ratings.
Findings: Subjects show improved study skills, wider repertories of reading content, improved vocational and personal goal planning, and beginnings of personal unification of diverse disciplines into a science of science.
Duration: September 1964-August 1965.
Investigator(s): Paul R. Ackerman (formerly) Director, Programs for the Gifted, and James E. Marshall, Director, Division of Special Education, State Department of Public Instruction, State Capitol, Topeka, Kans. 66612; Louis Fliegler, Ph.D., Coordinator of the Education of Exceptional Children, Department of Psychology, University of Denver, Denver, Colo.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Final report available 1966, Kansas State Department of Public Instruction.

20-QB-1 EAU CLAIRE COUNTY YOUTH STUDY PHASE III

Purpose: The study has two parts. The first is a pilot experiment using university upper classmen as tutors for children nominated from third grade as exhibiting disapproved classroom behavior and as being in need of remedial reading. The second part is a longitudinal study of subjects nominated in Phase I of the research project (see Bulletin 14, Research

Relating to Children).
Subjects: For the first part, 20 third graders, 10 experimental and 10 control; and for the second part, 1,550 children nominated in 1961 and 1962 from third, sixth, and ninth grades.
Methods: In pilot study, a battery of psychological and reading tests plus tutoring for control group.
Duration: May 1965-April 1968.
Investigator(s): John R. Thurston, Ph.D., and James J. Benning, Ed.D., Professors of Psychology, Wisconsin State University, Eau Claire, Wis. (Reported by Mrs. Trygve Ager, Administrator, Eau Claire Youth Study, 718 W. Clairemont Ave., Eau Claire, Wis.)
Cooperating group(s): Division for Children and Youth, Wisconsin State Department of Public Welfare; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Phase I final report, "Classroom Behavior: Background Factors and Psycho-Social Correlates," and Phase II final report, "Delinquency Proneness and Classroom Behavior," available from Eau Claire Youth Study; "Delinquency Proneness of Urban and Rural Youth," published in Journal of Research in Crime and Delinquency, Vol. 2, January 1965.

20-QB-2 AN ELEVEN-MONTH GROUP COUNSELING PROGRAM FOR GIFTED UNDERACHIEVERS

Purpose: To help talented underachievers find a place in a more psychologically meaningful group; to improve their interpersonal relationships at school and at home, and their classroom behavior and performance, academically and socially.
Subjects: 30 students in grades three, four, five, and six.
Methods: Group counseling based on the principles of Adlerian family counseling, conducted weekly for 40 to 45 minutes with five groups of seven to nine students from kindergarten through sixth grade. These talented low-producers (referred to as dysfunctioning children) were identified as gifted in one or more of following areas: academics, creativeness, leadership, and/or kinesthetic skills. Teachers and principals meet for weekly one-hour session and parents meet for two-hour session under leadership of qualified counselor experienced in Adlerian family counseling.
Findings: Findings from an 80-item parent checklist and a similar teacher checklist were subjected to a binomial test indicating at a significance level of .001 that the 30 students in the experimental group showed significant change for the better in behavior and attitudes at school and at home.
Duration: March 1964-June 1965.
Investigator(s): Manford Sonstegard, Ph.D., Professor of Guidance and Counseling, Southern Illinois University, Edwardsville; and G. E. Stormer, Director, Demonstration Center, School District 172, 1200 Maine St., Quincy, Ill.
Publication: Full report available in Progress Report No. 3, "A Demonstration of Group Counseling Procedures to Help Talented Underachievers in the Elementary School," Quincy Public Schools, Quincy, Ill., 1965.

20-QD-1 GROUP USE OF PROGRAMMED MATERIALS WITH RETARDED CHILDREN

Purpose: To determine (1) whether programmed materials can be used with retarded children under group-study conditions, and (2) which types of reinforcers are most effective in maintaining children's attention and effort.

BEST COPY AVAILABLE

Subjects: Six retarded and six normal children.
Methods: In group-study condition, subjects are seated before a screen upon which is flashed a frame of programmed material. Each subject in turn reads a question out loud and attempts a correct response before it is flashed on the screen. In order to maintain student attention and effort, extrinsic and social reinforcers are used, including group approval which attends responding in the group's presence, cooperation, and competition.
Duration: Not reported-July 1966.
Investigator(s): Robert L. Crist, Ph.D., Associate Professor of Psychology, Illinois State University, Normal, Ill. 61761.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-QG-1 OPERATION HEADSTART FOR DISTURBED CHILDREN

Purpose: To determine appropriate curriculum and teaching methods for preschool emotionally disturbed children which may affect positively subsequent adjustment at ages six, seven, and eight in a public school setting; to evaluate periodical learnings and adjustments of four- and five-year old emotionally disturbed and mentally retarded children; to evaluate growth and development of these children as a function of degree of parental acceptance of children's deviation; to compare developmental sequences of emotionally disturbed children with that of the so-called normal, especially as it affects physical, social-emotional, and speech developmental patterns.
Subjects: A class of six children, ages three to six, evaluated by St. Luke's Child Psychiatric Clinic.
Methods: Examination based on Connor-Talbot Curriculum Guide administered one month after entrance and at end of year; anecdotal records by teacher and student observers; speech and language growth as well as visual-perceptual evaluation to be measured at beginning of year and in spring; psychiatric evaluation at admission and during summer of 1967.
Duration: September 1965-June 1967.
Investigator(s): Frances P. O'Connor, Ph.D., and Abraham Tannenbaum, Ph.D., Professors, Teachers College, Columbia University; and Joan Miller, B.A., Teacher of Class, New York, N. Y. (Reported by Dr. Nathan Brown, Associate Director, Center for Urban Education, 33 W. 42nd St., New York, N. Y. 10036.)
Cooperating group(s): Center for Urban Education; Psychiatric Division, St. Luke's Hospital.
Publication: Report to be prepared by Dr. O'Connor.

20-QJ-1 PRESCHOOL CHILDREN COMPARATIVE PERFORMANCE ON THE HEADSTART SOCIAL BEHAVIOR INVENTORY

Purpose: To investigate the impact of a Headstart program on the social behavior of preschool children.
Subjects: Two preschool classes of 30 children of similar socio-economic background and chronological age level.
Methods: Administration of social behavior inventory during second and seventh weeks of Headstart program by classroom teacher; statistical analysis of sample data; scores statistically related and compared.
Findings: No difference in positive aspects of pupil behavior. Repetition of null hypothesis in negative aspects of pupil behavior indicates that some negative attributes of pupil behavior were corrected for this group of pupils during the seven-week Headstart program.

Duration: September-November 1965.
Investigator(s): Joseph Caliguri, Ph.D., Special Coordinator, Equal Educational Opportunities In-Service Program, Clark County School District, P.O. Box 551, Las Vegas, Nev. 89101.
Cooperating group(s): Clark County School District teacher personnel; Clark County School District Department of Instructional Services.
Publication: Paper will be submitted for publication in appropriate professional journal. Report will be kept on file in Clark County School District Department of Instructional Services, Research and Evaluation.

20-QJ-2 A STUDY OF EFFECTS OF FIRST YEAR OF TRAINING ON THREE- AND FOUR-YEAR OLD ENVIRONMENTALLY DEPRIVED SPANISH-AMERICAN CHILDREN

Purpose: A longitudinal program to test effectiveness of educational intervention in early childhood in the promotion of greater school success and the alleviation of concomitant problems of school failure such as discrimination, poverty, dropping out, mental retardation, emotional disturbances, unemployability, and delinquency. Specifically, to develop greater sensory and perceptual acuity, effective communication skills, problem-solving and related cognitive abilities, positive self concept, and methods and instruments for evaluating growth and development in these areas.
Subjects: (1) 30 Spanish-American 3- and 4-year-olds from families of lower-lower class as determined by occupation, income, and educational criteria; (2) matched Spanish-American control group (do not attend New Nursery); (3) group of Anglo middle and upper class children in a parallel experimental program; and (4) matched control group of Anglo children in traditional nursery programs.
Methods: Pre- and post-program assessments, as well as ongoing observational (including anecdotal) and related case studies. Data gathering techniques will include one-way glass, sound and video-tape recordings; pedagogical methods of Deutsch, Montessori, Moore, Piaget, et al., will be employed.
Findings: Superior success in kindergarten of first year "graduates" and favorable prognosis for successful completion of first grade as predicted by teachers. A mean increase of 7.64 I.Q. points on PPVT was found after seven months--a gain significant at the .01 level. Binet (1960 L-M) increases were noteworthy but not significant at the .05 level.
Duration: September 1964-indefinite.
Investigator(s): Glen Nimnicht, Ed.D., Associate Professor of Education; John Meier, Ph.D., Assistant Professor of Psychology; Barbara Mickey, Ph.D., Assistant Professor of Anthropology; and Gary Willoughby, M.A., Assistant Professor of Sociology, Colorado State College, Greeley, Colo. 80631.
Cooperating group(s): Boettcher Foundation, Denver; Ford Foundation; U. S. Office of Economic Opportunity.
Publication: Journal of Research, Colorado State College, June 1966; Chapters in The Disadvantaged Child, Vols. I and II, Seattle: Special Child Publications, 1966.

20-QJ-3 INCREASING THE ACADEMIC ACHIEVEMENT OF CULTURALLY DISADVANTAGED YOUTH

Purpose: To determine feasibility of instructing bright, low-achieving Negro boys in skills related to educational achievement, and to determine whether students respond differentially to instructional procedures.
Subjects: Junior high school Negro boys, judged by their teachers to be

able to learn but not doing so.
Methods: Establishment of small groups, including control groups, on basis of high and low achievement motivation; instruction in factors presumably related to academic achievement--fear of failure, subjective probability of success, peer group relationships, modes of expressing hostility, etc.; assessment of outcomes in terms of changes in academic performances.
Duration: February 1965-July 1966.
Investigator(s): Lawrence H. Stewart, Ed.D., Professor of Education, and Robert W. Moulton, Ph.D., Assistant Professor of Education, University of California, Berkeley 4, Calif.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Report to Office of Education; perhaps one journal article.

20-QJ-4 PRESCHOOL READINESS CENTERS IN THE CITY OF EAST ST. LOUIS, ILLINOIS

Purpose: To evaluate effect of preschool training of socially disadvantaged children upon their readiness for school; to develop a curriculum suitable for them; to change opinions of parents of socially disadvantaged children concerning importance of education as a means to economic security.
Subjects: 200 lower class children, ages one and one-half to six, in East St. Louis, Ill.
Methods: Selected AFDC mothers are trained by professional nursery school teachers to work with preschool culturally deprived children in a program designed to prepare these children for school entrance. Structured activities to promote cognitive development, particularly communication skills, comprise core of program, with supplementary training for social, emotional, and physical development. Pre- and post-testing provide data concerning verbal skills and general school achievement which are used for evaluating results of project.
Duration: October 1965-September 1968.
Investigator(s): J. Robert Russo, Ed.D., and Naomi Naylor, Delinquency Study Project, Southern Illinois University, Edwardsville, Ill. 62025.
Cooperating group(s): Delinquency Study Project, Southern Illinois University; Illinois State Department of Public Aid.
Publication: Periodic reports planned through duration, and upon completion of project.

20-QJ-5 THE DEVELOPMENT AND EVALUATION OF A DIAGNOSTICALLY BASED CURRICULUM FOR PSYCHOSOCIALLY DEPRIVED PRESCHOOL CHILDREN

Purpose: To identify and develop techniques and instruments useful in preschool diagnosis which lead to productive curriculum practices.
Subjects: Five-year old children without observable physical defects, I.Q.'s between 50 and 85, who fitted the criteria for psychosocial deprivation.
Methods: Curriculum designed and refined during first year of study is applied to three experimental groups for one academic year in each of three successive years. Criterion variables of achievement and adjustment for experimental groups are compared with those of three control groups as they complete successive years of regular school attendance.
Duration: September 1964-July 1969.
Investigator(s): Boyd R. McCandless, Ph.D., Professor of Education and Psychology; Walter L. Hodges, Ph.D., Assistant Professor of Educational

Psychology; and Howard H. Spicker, Ph.D., Assistant Professor of Special Education, Indiana University, Bloomington, Ind. (Reported by Joseph D'Ambrosio, Research Coordinator, University Schools Clinic Complex, Indiana University.)

20-QJ-6 "SUCCEED" PROJECT

Purpose: To study how schools might innovate programs in individualized education, especially in relation to needs of disadvantaged students.
Subjects: Faculties and students in a junior and a senior high school in each of four metropolitan Pittsburgh school districts outside the central city.
Methods: Cadre selected from school personnel and trained in Summer Workshop to be change agents; assessment of efforts to effect planned change in "natural state" school settings.
Duration: April 1965-1968.
Investigator(s): Raymond Hummel, Ph.D., Associate Professor, University of Pittsburgh, and Director, Project SUCCEED, 400 S. Craig St., Pittsburgh, Pa. 15213.
Cooperating group(s): Buhl Foundation, Pittsburgh.

20-QJ-7 INSTRUCTION OF SOCIO-ECONOMICALLY HANDICAPPED PRESCHOOL CHILDREN IN THE USE OF LANGUAGE TO INCREASE ACADEMIC APTITUDE

Purpose: To determine principles of language instruction which will increase the ability of socio-economically handicapped children to use language; to test hypothesis that special instruction in use of language with such children will result in improved language ability and more rapid academic progress during the first year of school; and to discover best ways of developing and using programmed instruction with language-handicapped young children.
Subjects: Children three to five years of age from various day care centers in Los Angeles County. For the final study there will be 200 experimental and 200 control children from this population.
Methods: Two groups of culturally-deprived children will be instructed in a different way; appropriate control groups of socio-economically handicapped and middle class children will also be used. Measures to be used as criteria for major experiment will include ability to understand instructions, questions, and information presented orally; ability to speak sentences (to describe situations presented visually) involving different linguistic forms and vocabulary; and ability to use language effectively in logical thinking (i.e., to use language to cue oneself appropriately in both overt and covert fashion). The most important criteria will include academic progress during the first grade.
Findings: A preliminary study has indicated a significant difference between low socio-economic and middle economic status children in auditory discrimination.
Duration: June 1965-June 1970.
Investigator(s): Evan R. Keislar, Ph.D., Professor of Education, and Carolyn Stern, Ed.D., Assistant Research Educationist, University of California at Los Angeles, 405 Hilgard Ave., Los Angeles, Calif. 90024.
Cooperating group(s): Los Angeles City Child Care Centers; Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Articles and papers to be prepared.

20-QJ-8 THE PREPARATION OF TEACHERS FOR SCHOOLS IN CULTURALLY DEPRIVED NEIGHBORHOODS (THE BRIDGE PROJECT)

Purpose: To improve the preparation of teachers for working with children in schools in slum-ghetto areas.

Subjects: Three teachers working with approximately 85 children for the three years of junior high school.

Methods: A small school-within-a-school was created within which three classes of children were taught English, science, math, and social studies by the same teachers for three years. Progress was measured by pre- and post-administrations of the Wechsler Individual Scale for Children (WISC) and annual administration of the Metropolitan Achievement Test.

Findings: Project boys gained 6.25 points in Verbal I.Q. while control boys gained only 0.28 points, a statistically significant difference. Project boys gained 5.32 points in Full Scale I.Q. as compared to 1.78 points for control boys.

Duration: February 1961-July 1965.

Investigator(s): Robert W. Edgar, Ed.D., and Helen Storen, Ed.D., Professors of Education, Queens College, Flushing 67; and Albert J. Harris, Ph.D., Professor, Division of Teacher Education, City University of New York, 535 E. 80th St., New York, N. Y. 10021.

Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

Publication: Full report and summary available upon request.

20-QJ-9 SENSORY-PERCEPTUAL LANGUAGE TRAINING TO PREVENT SCHOOL LEARNING DISABILITIES IN CULTURALLY DEPRIVED PRESCHOOL CHILDREN

Purpose: To prevent learning problems in school, failure to achieve, and subsequent school dropouts through counteracting inhibiting effects of cultural deprivation on language and perceptual learning during preschool years.

Subjects: 40 children, ages three, four, and five, enrolled in a day care center in a neighborhood characterized by extremely low socio-economic status. Approximately the same number of children serving as a control group are enrolled in a day care center in another area of the city, also a socio-economically depressed area.

Methods: Professionally trained personnel in area of speech and language pathology are conducting daily preschool instruction programs for preschool children in the three subgroups, three to five years. Emphasis is on methods that have been found successful with children whose physical or sensory disabilities have precluded normal acquisition of language. Curriculum and methods are being developed and adapted to formulate a maximally effective program to achieve the objectives. Curriculum emphasis includes adaptation of Montessori methodology, sensory-perceptual training, utilization and adaptation of early reading experiences using the ITA system, and intensive stimulation of language development.

Duration: June 1965-May 1968.

Investigator(s): Freeman McConnell, Ph.D., Director, and Kathryn Horton, M.S., Instructor in Speech Pathology, The Bill Wilkerson Hearing and Speech Center, Vanderbilt University, Nashville, Tenn.

Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-QJ-10 INTELLECTUAL STIMULATION OF CULTURALLY DEPRIVED INFANTS DURING THE PERIOD OF EARLY VERBAL DEVELOPMENT--FIFTEEN MONTHS TO THREE YEARS

Purpose: To attempt to raise level of intellectual performance of culturally deprived infants through a program of intellectual stimulation in the home, from infant's age of 15 to 36 months; to study correlates of intellectual growth and sequence of intellectual growth during this period.
Subjects: 30 infants and an untutored control group.
Methods: Flexible, informal tutoring in the home for an hour a day, five days a week; evaluation before 15 months and at 21, 27, and 36 months to determine if, when, and in what specific abilities differences emerge between tutored and untutored children.
Duration: 1965-1968.
Investigator(s): Earl S. Schaefer, Ph.D., Senior Scientist, Laboratory of Psychology, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda, Md.

20-QJ-11 IMPACT ON LEARNING AND RETENTION OF SPECIALLY DEVELOPED HISTORY MATERIALS FOR CULTURALLY DEPRIVED CHILDREN

Purpose: To determine whether or not culturally disadvantaged youth in eighth grade will learn more, retain learning longer, and be more interested in their study of the Civil War period when material on the Negro is included in their studies in two forms--text-like materials, or fiction and biography, than when customary text is basis of study material.
Methods: Cooperative development of a teaching unit on Civil War period, with testing instrument based on concepts agreed to be fundamental to study of period; testing to consist of pre-test, post-test, and follow-up-test four months after conclusion of study; during and after study of unit, classroom observations, questionnaires, and interviews to determine responsiveness of pupils to Negro materials.
Duration: 1964-1965.
Investigator(s): Robert W. Edgar, Ed.D., Professor, and Carl Auria, Ed.D., Assistant Professor, Department of Education, Queens College, City University of New York, Flushing, N. Y. 11367.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-QJ-12 EFFECTS OF AN ENRICHMENT PROGRAM ON SIX-YEAR OLD CHILDREN

Purpose: To evaluate effects of an enrichment program on six-year old children; to gauge effects on I.Q., achievement, and language, with particular reference to pattern, fluency, and vocabulary.
Subjects: 90 children from a participating school in the Philadelphia Educational Improvement Program, and a control group matched on achievement.
Methods: Pre- and post-test measures include Kuhlmann-Anderson Intelligence Tests, Metropolitan Achievement Tests, and two Philadelphia Achievement Tests. A two by three analysis of covariance is performed on each post-test measure using its corresponding pretest as a control. A situational language test is administered to both groups at end of one school year and analyzed by a two by three analysis of variance.
Duration: Not reported-January 1967.
Investigator(s): Marciene S. Mattleman, Department of Elementary Education, Temple University, Philadelphia, Pa. 19122.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-QJ-13 AN AUTOMATED PRIMARY GRADE READING AND ARITHMETIC CURRICULUM FOR CULTURALLY DEPRIVED CHILDREN

Purpose: To identify obstacles to acquiring basic skills of reading and arithmetic in primary grades, particularly by culturally deprived children, and to devise behavioral methods for overcoming these obstacles.
Methods: Sequential organization of written materials and preparation of auditory materials to accompany it; use of appropriate instruments for presenting curriculum materials both auditorily and visually, and thereupon recording students' responses and response times.
Investigator(s): Richard C. Atkinson, Ph.D., Associate Professor of Psychology and Education, and Patrick Suppes, Ph.D., Professor of Philosophy and Statistics, Stanford University, Stanford, Calif.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-QJ-14 RAISING EDUCATIONAL ASPIRATIONS OF THE CULTURALLY HANDICAPPED

Purpose: To test hypothesis that cognitive, social, and verbal readiness of preschool, non-urban children and their parents' aspirations for their children's education will be increased by an intensive program of home teaching and guidance.
Subjects: 30 children from families earning less than $3,000 a year, known to welfare agencies and residing in non-urban areas near Plattsburgh.
Methods: Subjects are assigned to three groups, each of which receives treatment and attention, attention only, or no attention and no treatment. Stanford-Binet I.Q. Test, Vineland Social Maturity Scale, Illinois Test of Psycholinguistic Abilities, Columbia Test of Mental Maturity, and Plattsburgh Arithmetic Readiness Inventory are used to measure dependent variables. Parents' aspirations for their children's education are assessed by content analysis of recordings of home teacher's interviews with each parent.
Duration: November 1964-December 1965.
Investigator(s): Anthony N. Schwartz, Campus School Principal, State University College, Plattsburgh, N. Y.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-QJ-15 A PRESCHOOL PROGRAM FOR SPANISH-SPEAKING CHILDREN

Subjects: Spanish-name children from low income families living on West Side of San Antonio, Texas.
Methods: Subjects, accepted at age three, continue in preschool for three years. Mothers also participate by attendance with children, observation of activities, and group discussion. Follow-up evaluation of experimental and control group is done in cooperation with public schools in order to determine effect of program on adjustment of child in first year of school. Emphasis is placed on language facility in both Spanish and English, as well as upon factors of cultural difference, and on provision of experiences geared to enriching child's life and preparing him for adaptation to demands of dominant culture.
Duration: June 1965-May 1970.
Investigator(s): Constance N. Swander, M.S.W., A.C.S.W., Executive Director, and Gladys R. Blankenship, B.A., Good Samaritan Center, 1600 Saltillo St., San Antonio, Tex. 78207.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-QJ-16 STUDY OF THE EFFECT OF SELF-DIRECTIVE DRAMATIZATION ON PROGRESS IN READING ACHIEVEMENT AND SELF-CONCEPT OF CULTURALLY DISADVANTAGED ELEMENTARY SCHOOL CHILDREN

Purpose: To determine (1) if, through use of self-directive dramatization, significant gains can be effected in reading achievement and in improvement in self-concept of groups of culturally disadvantaged school children, and (2) if gains in reading achievement and improvement in self-concept are related.
Subjects: Culturally disadvantaged Negro children from low income homes, divided into four or more classes of 30 children each, in Forest Park Elementary School, Joliet, Ill.
Methods: Pupils will read from wide selection of materials, select stories to read in small groups, read, and dramatize them. Before and after each phase of study, a reading test will be administered to each child and each pupil will be checked on a question sheet containing descriptions of behavior manifestations indicative of positive or negative self-concept. Significance of reading gain and self-concept changes will be determined. Matches for each pupil selected from other classes will receive reading instruction chiefly through use of a basal reader, and mainly in formal whole-class or small group sessions. Significance of difference in gain in reading achievement made by pupils in experimental classes and by those in other classes who are paired with them will be determined.
Duration: September 1964-continuing.
Investigator(s): Robert H. Moore, Ph.D., Professor of Education, and Lessie Carlton, Ed.D., Associate Professor of Education, Illinois State University, Normal, Ill. 61761.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-QJ-17 COMPARING READING APPROACHES IN FIRST GRADE TEACHING WITH DISADVANTAGED CHILDREN (THE CRAFT PROJECT)

Purpose: To compare two main approaches and four specific methods of teaching reading to discover their effectiveness with disadvantaged urban Negro children.
Subjects: 1,378 children chosen from 12 elementary schools with a high percentage of Negro children, a minimum of six first grade classes, with evidence of cultural deprivation and marked retardation in previous surveys of reading ability. 1,146 children remained to conclusion of first grade testing.
Methods: Random assignment of four methods to schools, two methods to each school; random assignment of teachers to two methods within school; and random assignment of pupils within each school to two methods. Children with and without kindergarten experience were balanced in assignment to methods. Four treatment methods were: (1) skills-centered method using basal readers, with close adherence to instructions in teacher's manuals; (2) skills-centered method utilizing basal readers, but substituting Phonovisual method of teaching word-attack skills for word-attack lessons accompanying basal reader; (3) language-experience method, in which the beginning reading materials were developed from oral language of the children; and (4) language-experience method with heavy supplementation of audio-visual procedures. Pre- and post-tests were administered.
Findings: Most disadvantaged first grade Negro children can respond to superior teaching with good learning and can learn to read by same methods that work with middle class white children.
Duration: June 1964-March 1966.
Investigator(s): Albert J. Harris, Ph.D., Professor, and Blanche L. Serwer, Lecturer, Division of Teacher Education, City University of New

York, 535 E. 80th St., New York, N. Y. 10021.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Article in Reading and Inquiry, J. Allen Figurel (Ed.), International Reading Association Conference Proceedings, Vol. 10, 1965. Newark, Delaware: International Reading Association; also mimeographed reports.

20-QJ-18 CONTINUATION OF THE CRAFT PROJECT

Purpose: To discover whether the relative effectiveness of the four methods of reading instruction utilized in the CRAFT Project changes as original first grade pupils progress into second and third grades.
Subjects: Thirty-eight classes in the CRAFT Project.
Methods: Thirty-eight classes in the CRAFT Project will continue for a second year to receive instruction based on their first year reading instruction. Second grade teachers will be given assistance by district reading coordinator and will take part in a training workshop. A uniform test battery will be administered near the end of second year. Minimal number of observations by research assistants will be scheduled to check objectively the internal validity of the methodological variables. The four teaching methods will be compared using statistical procedures similar to those used in CRAFT. There will be no attempt to control teaching procedures in third grade. Children who move to other schools will be traced, and scores on city-wide reading tests will be sought for all children who participated in first and second grades.
Duration: 1965-January 1968.
Investigator(s): Albert J. Harris, Ph.D., Professor; Blanche L. Serwer, Lecturer; and Kenneth Brelesky, Research Assistant, Division of Teacher Education, City University of New York, 535 E. 80th St., New York, N. Y. 10021.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Final report planned for January 1968.

20-QM-1 ELEMENTARY SUMMER SCHOOLING OF MIGRANT CHILDREN

Purpose: To analyze educational process in special summer school program for children of migrant agricultural laborers in New Jersey; to determine whether success of academic program depends upon effectiveness of acculturation process and whether social structure of migrant families impedes academic achievement and learning of values, goals, and patterns of conduct necessary for participation in modern community life.
Subjects: Students in the New Jersey summer schools for children of migratory agricultural workers during summers of 1962 and 1963, and their mothers.
Methods: The school program consisted of two elements: a program of standard academic studies and a program of nonacademic skills and knowledge felt to be essential to participation in modern community life. Evaluation was based on information derived from systematic interviews with state and local educators, migrant children and their parents, and teachers. Achievement tests were administered to children. Observers, participating to a limited extent in classroom activities, compiled data regarding educational processes and subcultural patterns and problems of migrant children and their families.
Findings: Findings are reported in the monograph, "Elementary Summer

Schooling of Migrant Children", 1964 in Chapters 4 to 10. The final chapter, Chapter 11, recommends a program.
Duration: January 1962-August 1964.
Investigator(s): Simon Marcson, Ph.D., Associate Professor, and Frank A. Fasick, Ph.D., Assistant Professor, Department of Sociology, Rutgers University, New Brunswick, N. J. 08903.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Final report to Office of Education.

20-QM-2 EDUCATIONAL PROGRAMMING FOR PUPILS WITH NEUROLOGICALLY BASED LANGUAGE DISORDERS

Purpose: To test the relative efficacy of teaching children with specific language disorders attributable to medically diagnosed neurological impairment in regular, heterogeneously grouped classroom activities, supplemented by individual language therapy, or in special, homogeneously grouped classes; to investigate whether such pupils make significantly greater gain in mental function and/or academic achievement when they are on medically prescribed anticonvulsive medication than when they are not.
Subjects: 100 children with neurologically based language disorders, matched for sex, age, WISC scores, and scholastic achievement, divided into two groups.
Methods: One group receives individualized language therapy in regular classrooms; the other group is enrolled in homogeneously grouped special education classes. Half of the subjects in each group receive anticonvulsive medication as prescribed by physician. Scholastic achievement is to be tested before and two years after the program.
Duration: July 1964-December 1967.
Investigator(s): Empress Y. Zedler, Ph.D., Professor of Education and Director, Speech, Hearing, and Language Clinic; J. Lloyd Rogers, Ph.D., Chairman, Department of Education; and Olga Dominguez, M.A., Clinical Supervisor, Southwest Texas State College, San Marcos, Tex.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-QM-3 AN INVESTIGATION OF THE EFFECT OF PRESENTING A SEX EDUCATION COURSE TO HIGH SCHOOL STUDENTS WHO HAVE BEEN REMOVED FROM THE REGULAR CLASSROOM SITUATION BECAUSE OF SEVERE EMOTIONAL AND PHYSICAL PROBLEMS

Purpose: To discover whether a course in sex education presented to emotionally disturbed and physically disabled adolescents will increase their knowledge and understanding about sex and reduce their level of manifest anxiety.
Subjects: High school students in eleventh and twelfth grades who are on Home Instruction with New York City Board of Education.
Methods: Pretest, post-test studies after presenting a 12-week sex education course. Use of lecture-discussion method with audio-visual aids as lead-in to discussion.
Duration: February 1966-June 1967.
Investigator(s): Jean L. Bloom, M.Ed. (Ph.D. Candidate, New York University), Coordinator of School Programs, Federation of the Handicapped, 154 W. 14th St., New York, N. Y. 10011.
Publication: On file as a doctoral dissertation at New York University; possible article for Exceptional Children.

20-QM-4 METHODS OF TEACHING BRAILLE READING

Purpose: To determine and describe methods used in teaching Braille reading to blind children; to test which methods produce better Braille readers; to determine reading rate and comprehension of Braille readers and compare with norms for visual readers; to determine specific reading characteristics of good Braille readers; to determine the relation of certain individual characteristics of blind children, such as age at onset of blindness, visual residue, etc., with achievement in Braille reading.
Subjects: 50 fourth graders in residential schools, 50 fourth graders in public school facilities for blind children; 50 eighth graders in residential schools, and 50 eighth graders in public school facilities for blind children, in U.S.A.
Methods: Questionnaires and reading tests, and a workshop of practitioners in teaching Braille reading.
Duration: September 1964-February 1967.
Investigator(s): Berthold Lowenfeld, Ph.D., Research Professor, Frederic Burk Foundation for Education, San Francisco State College, 1600 Holloway Ave., San Francisco, Calif. 94132.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Publication of a book is planned.

20-QM-5 HARRIS COUNTY, TEXAS MOBILITY AND ORIENTATION INSTRUCTION FOR BLIND CHILDREN AND ADULTS

Purpose: To demonstrate validity and value of systematic teaching of orientation and mobility to blind children and adults to enable them to travel freely and independently.
Subjects: Blind children and adults of Harris County, Texas.
Methods: Trainees will be given physical and psychological examinations to determine ability to take training; preinstruction evaluations will be made of mode, independence, frequency, and effectiveness of travel. Intensive three-month training period, three to five hours a week, using basic techniques and touch, or Hoover, techniques with the cane. Pre-cane skills will be taught at elementary school level. Follow-up evaluations will be made at six months, one, two, and three years after training.
Investigator(s): James E. Kean, Director, Children's Center and Clinical Services; Jeanna Fultz, Mobility Instructor; Diane Cassady, Psychologist; Frank D. Hill, III, M.D., Pediatric Consultant; and Mary C. Fletcher, M.D., Pediatric Ophthalmologist Consultant, Houston-Harris County Lighthouse for the Blind, 3530 W. Dallas, P. O. Box 13435, Houston, Tex. 77019.
Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.
Publication: Report to be published.

20-QM-6 CORRECTION OF FUNCTIONAL MISARTICULATION UNDER AUTOMATED SELF-CORRECTION SYSTEM

Purpose: To develop, apply, and evaluate a system of programmed instruction for rehabilitation of functional misarticulation of children in the elementary school, with application being made through a completely automated system--the Automated Speech Correction Program.
Subjects: 100 children in Las Cruces, New Mexico public schools, ages 7 years 9 months to 12 years, who exhibited functional misarticulation, but were normal in intelligence, hearing, and emotional adjustment.

Methods: The programmed instruction met the criteria established for intrinsic programming, employing approximations leading to specified terminal behavior. Basic phonetic materials were generated by an IBM 1620 digital computer with the generating matrix programmed for probability of misarticulation, similarity of acoustical impression, degree of perceptual confusion, similarity of articulatory pattern, and frequency of use. A randomized complete block design was used, with five different elementary schools being the blocks and 20 children at each school being the subjects. Data were derived from the Templin Short Test of Sound Discrimination, the Templin-Darley Short Form Articulation Test, and specially developed test of auditory discrimination and articulation.
Findings: The ASCP produced changes in auditory discrimination of subjects at a P greater than .001, and in articulation pattern of subjects at P levels greater than .05 and .001, depending upon combination of treatment.
Duration: September 1964-August 1965.
Investigator(s): Edgar R. Garrett, Ph.D., Professor of Speech; Robert Sabin, B.S., Consultant; and Merrell E. Thompson, Ph.D., Department of Psychology, New Mexico State University, P.O. Box Y, University Park, New Mex.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Paper presented at National Convention of American Speech and Hearing Association, Chicago, Ill., November 1965; American Speech and Hearing Association: VII: 422, 1965; other publications planned.

20-QM-7 EVALUATION OF SENSORY-MOTOR ARTICULATION THERAPY

Purpose: To continue investigation of relative effectiveness of sensory-motor articulation therapy, controlling for effect of therapist's personality, on reduction of articulatory errors in third to sixth grade children.
Methods: In 1965-66 phase, three groups of children were given a Deep Test of Articulation at beginning and end of school year. One group was treated by sensory-motor methods in which 15 therapists received six weeks of training; second group was treated by additional methods in which 14 therapists had a one-week refresher course; and third group received no therapy. Data will be analyzed to determine if sensory-motor method of articulation therapy produced greater improvement in articulatory skills than maturation or traditional method of articulation therapy. In 1966-67 phase, traditional therapists of initial phase will, after intensive training in sensory-motor procedures, employ these methods with another group of children. Improvement in children's articulatory skills attained by therapists when using traditional procedures will be compared with improvement made by children when same therapists follow sensory-motor procedures.
Duration: 1965-1967.
Investigator(s): Eugene T. McDonald, Ed.D., Research Professor of Speech Pathology, and Lester F. Aungst, M.S., Research Assistant, Department of Special Education, Pennsylvania State University, University Park, Pa.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

20-QN-1 AN EVALUATION OF THE YOUTH AND WORK TRAINING PROGRAMS OF THE NEW YORK STATE DIVISION FOR YOUTH

Purpose: To evaluate relative effectiveness of the Youth and Work Training Programs utilizing an experimental-control design; specifically, (1) to identify the pertinent characteristics of the study population, including attitudes that might be relevant to the understanding of the problems related to the dropouts' educational and vocational adjustment; (2) to establish criteria to evaluate the effectiveness of specific types of program intervention on experimentals as compared to controls; (3) to establish a classification of the study population, and if indicated, to describe type of program intervention found most effective in relation to this classification or typology.
Subjects: School dropouts who had evidenced a lack of positive work attitudes and basic skills necessary to secure employment and who took part in Youth and Work Training Programs of the New York State Division for Youth.
Methods: Follow-up interviews, data collection from case records, and staff opinion survey.
Duration: 1963-1968.
Investigator(s): Roslyn G. McDonald, Deputy Director, Research and Planning, and Irwin J. Goldman, New York State Division for Youth, 270 Broadway, New York 7, N. Y. (Reported in the section "Current Projects" of the *International Bibliography on Crime and Delinquency*, May 1966.)
Cooperating group(s): Youth Research, Inc.; Ford Foundation.

SOCIAL SERVICES

20-RA-1 SURVEY OF ACTION AREA RESIDENTS: BALTIMORE, MARYLAND

Purpose: To test a series of assumptions about characteristics and problems of an anti-poverty program target population frequently cited in connection with meeting the needs of impoverished youth and adults, and to involve the potential beneficiaries in a realistic way in planning an urban anti-poverty program.
Subjects: 250 youths 14 to 19 years of age, and 250 adult heads of households residing in anti-poverty target area. Within study area, a sampling frame was developed based on degree of overcrowding, in order to preclude inadvertent inclusion of large numbers of those not considered likely potential beneficiaries of services to be offered; sampling points were randomly chosen; and block quotas were established based on number of occupied dwelling units.
Methods: Intensive home interviews were conducted, utilizing separate interview schedules for youth and for adults based on different series of assumptions pertaining to experiences with health, welfare and recreation services, perceptions of neighborhood problems, preferences regarding solutions, and attitudes.
Findings: Widespread dissatisfaction with conditions in their neighborhoods and with amount and quality of city services was expressed by both youth and adults. There was also a general lack of awareness of certain kinds of services, especially the less tangible ones, and many known services were felt to be inaccessible. Unlike adults, youth did appear to be conscious of importance of education and jobs, and were generally more optimistic than their elders. One major limitation on the effectiveness of programs for this group may well be the deficiencies in family life uncovered by the survey. However, there is evidence that these residents are not as mobile and transient as often supposed, increasing chances of success for both neighborhood-based and long-term programs that may be needed to deal with their problems.
Duration: August 1964-August 1965.
Investigator(s): Daniel R. Fascione, M.A., Director of Research, Health and Welfare Council of the Baltimore Area, Inc., 10 South St., Baltimore, Md. 21202.
Publication: *Survey of Action Area Residents: Baltimore, Maryland*, Health and Welfare Council of the Baltimore Area, Inc. - 64 pages.

20-RA-2 NEW ORLEANS JEWISH ADOLESCENT STUDY

Purpose: To determine attitudes and opinions of Jewish youth in grades 10 through 12 in New Orleans as a means of evaluating services presently offered, and to determine if other services are needed.
Subjects: Total population of Jewish children in grades 7 through 11 as of May 1965, and 107 Jewish boys and girls, comprising one-third of total in grades 10, 11, and 12 in June 1965.
Methods: Demographic study by means of telephone interviews conducted by volunteers; in-person interviews with sample of 107 conducted by paid interviewers.
Findings: Demographic data: group is primarily middle class, doing well

academically; 89 percent live with both parents and 92 percent have at least one sibling; almost one-third go to private schools; frequency of performing chores at home declines as age goes up; more than half belong to some school or nonschool social organization.
Duration: September 1963-January 1967.
Investigator(s): Viola W. Weiss, M.S.S.A., Director of Planning and Education, and John C. Rosen, M.A., Director, Jewish Children's Home Service, 1636 Toledano No. 305, New Orleans, La. 70115.
Cooperating group(s): New Orleans Jewish Federation.
Publication: Report on Phase I (demographic) available from Jewish Federation of New Orleans, 211 Camp St. Publication of Phase II not yet determined.

20-RD-1 SOCIAL GROUP WORK WITH THE CULTURALLY DEPRIVED

Purpose: To enable educationally disadvantaged girls to improve their academic and social performance in school.
Subjects: Second and third grade girls referred by school personnel as not achieving satisfactorily in academic work and having difficulty in relationships with peers and adults.
Methods: Social group work treatment with participation of parents in various ways; project to be carried on in schools and then eventually integrated into ongoing program of Camp Fire Girls; results to be evaluated at various stages of program.
Duration: September 1963-August 1967.
Investigator(s): Tetsu Sugi, M.S.W., Camp Fire Girls, Los Angeles Area Council, 304 S. Kingsley Dr.; and Edith Miller Tufts, Ph.D., Research Director, and Professor, School of Social Work, University of Southern California, Los Angeles, Calif.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-RD-2 PROJECT MIAMI: MOTIVATION INVOLVEMENT ATTACKS MASSIVE ISOLATION

Purpose: To modify observable behavior patterns of girls with maximum possibilities of delinquency and dropout problems with aim of picking up educational lags, enriching cultural and living experiences, providing support for personal and environmental problems, helping to establish realistic social values, and upgrading future aspirations.
Subjects: 50 girls, ages 13 to 16 who, according to school, police departments, courts, and other agencies, show poor educational, personal, and social adjustment.
Methods: Group work and a leadership training program.
Duration: July 1965-June 1966.
Investigator(s): Susan Love, A.C.S.W., Executive Director, Young Women's Christian Association of Miami (Dade County), 114 S.E. 4th St.; Richard S. Sterne, Ph.D., Research Director, Welfare Planning Council, 395 N.W. 1st St., Miami, Fla. 33136; and Mary L. Baker, Counselor, Shawnee High School, Louisville, Ky.
Cooperating group(s): Office of Juvenile Delinquency and Youth Development, U. S. Department of Health, Education, and Welfare.

20-RJ-1 EXTRAFAMILIAL ADOPTIONS

Purpose: To improve all phases of adoption procedures touching the lives of adopted children; to study specific emotional problems of children adopted outside of their own families.
Methods: Clinical investigation.
Investigator(s): Ralph I. Fried, M.D., Chairman, Committee on Adoptions, American Academy of Pediatrics, 1801 Hinman Ave., Evanston, Ill.

20-RJ-2 THE JEWISH FAMILY AND CHILDREN'S SERVICE ADOPTION STUDY

Purpose: To analyze characteristics, experiences, and attitudes of successful and unsuccessful applicants for a sectarian adoption service, in order to identify ways of strengthening the administration of the service and the prospective adoptive parents' understanding of the adoption process. Study was designed to complement an administrative evaluation of the adoption service that had recently been undertaken.
Subjects: From an analysis of agency records covering 164 applicants, three sub-samples were developed which yielded 16 interviews with successful applicants and 18 interviews with applicants who did not receive a placement from the agency.
Methods: First phase involved systematic analysis of agency case records on recent applicants for an adoptive child, in order to determine outcome of each case and characteristics of applicant couples. Second phase consisted of intensive home interviews of adoptive applicants, half of which were joint interviews with both husband and wife and half with wife alone.
Findings: The interviews reflected the complexities of an adoption service and underscored the difficulties of effectively administering one of such small scope. Applicant attitudes and expressions of satisfaction and dissatisfaction with adoption process were evaluated, and specific areas were identified for agency consideration of policy or administrative changes.
Duration: January 1964-September 1965.
Investigator(s): Daniel R. Fascione, M.A., Director of Research, Health and Welfare Council of the Baltimore Area, Inc., 10 South St., Baltimore, Md. 21202.
Cooperating group(s): The Jewish Family and Children's Service, Baltimore, Md. 21215.
Publication: Information available on request to: Mr. Milton Goldman, Executive Director, The Jewish Family and Children's Service, 5750 Park Heights Ave., Baltimore, Md. 21215.

20-RJ-3 PREDICTABILITY IN ADOPTION

Purpose: To identify salient characteristics of children needing adoptive parents as well as couples wanting to adopt them, and to relate these characteristics to various aspects of later functioning that are indicative of successful placements.
Subjects: About 200 adopted and 100 natural children of the Caucasian race whose parents volunteered to participate in the study.
Methods: A wide variety of information, including developmental assessment scales, parental attitude inventories, and ratings based on interviews with fathers and mothers, is being collected for the adopted children before placement as well as at 2, 4, 7, 10, and 13 years of age. More extensive observations of the children's behavior are planned when they are of school

age. Similar data are being gathered for natural children.
Duration: July 1962-July 1976.
Investigator(s): Byron W. Lindholm, Ph.D., Director, Delaware Family Study, Children's Bureau of Delaware, Inc., 1310 Delaware Ave., Wilmington, Del.
Cooperating group(s): Christiana Foundation, Wilmington; Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.
Publication: Findings will be published as they become available.

20-RJ-4 FOLLOW-UP STUDY OF CROSS-RACIAL ADOPTIONS

Purpose: To study adjustment of non-Caucasian children placed in adoptive homes with Caucasian parents.
Subjects: 15 children, five to 10 years old, who had been adopted when less than one year old.
Methods: Interviews with both parents, taken separately but on same schedule of approximately 150 questions; interviews with two neighbors of the parents and with teachers of subject child; structured observation of family in home for seven-hour period; psychological tests.
Findings: Adoptive families of minority children are much like adoptive families of white children in age, education, and economic status. In general, parents like children and had their own both before and after adoption of the minority child and other children which they adopted. Children generally are average students according to grades and teacher ratings, and have no marked behavior problems, as indicated by psychological tests and reported behavior. None of neighbors identify problems connected with race.
Duration: 1964-1967.
Investigator(s): Laurence K. Northwood, Ph.D., Associate Professor of Social Work, University of Washington; and Patricia Denny, Caseworker, Catholic Children's Services of Seattle, Seattle, Wash.
Cooperating group(s): The Menninger Foundation, Topeka, Kans.

20-RM-1 USE OF FOSTER FAMILY HOMES IN SOCIAL INTERVENTION

Purpose: To test hypothesis that foster family care is a useful intervention technique in the culture of poverty, and that placement in foster family care changes career and educational goals of educationally and culturally deprived young people.
Subjects: 26 Negro students from Prince Edward County, Virginia, who were in foster family care for one to two years from 1961 to 1963 while their schools were closed defying desegregation.
Methods: Research interviews with former foster parents, students who were in foster care, and natural parents of students.
Findings: Students were well integrated young people who adjusted easily to foster care and new school situations. There was no evidence that they were harmed by foster family placements. They felt that they benefited by the enriched school program and more diversified experiences. They were quickly reassimilated into their families who appeared to be the important influence on their life goals.
Duration: June 1964-June 1967.
Investigator(s): Frances P. Simsarian, D.S.W., Associate Professor, School of Social Work, Howard University, Washington, D. C.
Cooperating group(s): Washington School of Psychiatry; National Institute of Mental Health, Public Health Service, U. S. Department of Health,

Education, and Welfare.
Publication: Part of the study is forthcoming in Social Work.

20-RM-2 EMPIRICAL ASSESSMENT OF CHARACTERISTICS OF CHILDREN IN FOSTER PLACEMENT

Purpose: To study the behavioral characteristics of children in foster care and relationships existing between factors in the child's life experience and his characteristic behavior patterns.
Subjects: 69 children in foster care, approximately age 12.
Methods: Survey of case records of worker judgment regarding the characteristics of children conducted in accordance with a research schedule designed to assess over 48 behavioral characteristics.
Duration: 1965-1967.
Investigator(s): Edmund V. Mech, Ph.D., Professor, School of Social Service, Arizona State University, Tempe, Ariz.; Harriet Goldstein, M.S.W., Foster Care Supervisor; and Joseph L. Taylor, M.S.W., Executive Director, Association for Jewish Children, 1301 Spencer St., Philadelphia, Pa.
Cooperating group(s): Philadelphia Foundation.
Publication: Monograph or article in Child Welfare.

20-RM-3 PSYCHIATRIC CARE THROUGH SPECIAL FOSTER HOMES

Purpose: To train foster parents to care for emotionally disturbed children; to offer brief residential care to children to prepare them for foster homes.
Subjects: Emotionally disturbed children between the ages of 6 and 16 admitted to Merrifield, a residential treatment center.
Methods: Group meetings are held with foster parents, foster parents are seen for case work treatment, and children receive individual psychotherapy. Focus is on developing selection criteria for, and examining the process of, training foster parents in care of emotionally disturbed children. Project combines use of Merrifield house as a residential facility with use of special foster homes. Goal is to restore children to their own homes. Project also deals with problem of developing criteria to determine when a child can be helped by being separated from his family.
Duration: October 1962-not reported.
Investigator(s): Albert Krinsky, M.D.; Lisa Pollack Rablen, M.D.; and Bernard Rosenblatt, Ph.D., Merrifield Center, 158 Holden St., Worcester, Mass. (Reported by Sebastiano Santostefano, Ph.D., Director of Research, Worcester Youth Guidance Center, 275 Belmont St., Worcester, Mass. 01604.)
Cooperating group(s): Worcester Children's Friend Society; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-RV-1 A STUDY OF COUNSELING WITH FAMILIES OF "DISADVANTAGED" YOUTH

Purpose: To determine the differences between value systems of essentially "middle class" counselors and of families in an urban poverty pocket.
Subjects: Families of a low income, urban redevelopment area.
Methods: Teams of two, one male and one female counselor, have continuous supervision for long-range family counseling. Counselors are first and second year graduate students.
Findings: Values are extremely disparate. More "flexible," open and

accepting counselors are more able to communicate and be accepted as helpful by families.
Duration: September 1964-not reported.
Investigator(s): Billie C. Beatty, Ph.D., Associate Professor of Counseling, San Francisco State College, 1600 Holloway, San Francisco, Calif. 94132.
Cooperating group(s): Booker T. Washington Community Center.

20-RV-2 ORGANIZATION AND UTILIZATION OF PUBLIC ASSISTANCE PERSONNEL

Purpose: To study relationships of maternal and child health services to public welfare programs; specifically, to determine ways that Aid to Families with Dependent Children Program can facilitate delivery of maternal and child health services.
Subjects: Families receiving public assistance, including 300 families receiving AFDC in Cook County, Ill.
Methods: Data will be analyzed on such topics as mothers' physical and mental health, behavior problems of children, child care practices, and nutritional factors. Data will also be analyzed with respect to each child -- his birth (legitimacy) status, relationship to head of Aid to Dependent Families and Children family, major physical disabilities, and present health problems. Data will then be related first to history of help sought for health problems, medical service received, and remaining unmet needs for medical and health services. An attempt will then be made to determine relationship of receipt or failure to receive needed medical service to nature and volume of services (chiefly referrals) provided by public assistance agency under study.
Duration: April-September 1966.
Investigator(s): Edward E. Schwartz, Ph.D., George Herbert Jones Professor; William C. Sample, M.A., Assistant Professor; and Claire Anderson, M.A., Research Associate, School of Social Service Administration, University of Chicago, Chicago, Ill. 60637.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

20-RX-1 USE OF TRAINED LOCAL YOUTH AS COMMUNITY MENTAL HEALTH AIDES

Purpose: To test a new approach to the prevention and treatment of mental health problems of youth from disadvantaged backgrounds through utilization of trained local youth from similar backgrounds.
Subjects: 180 girls and boys, ages 11 to 16, from the Second Police Precinct, Washington, D. C.
Methods: Nine trained local youth serve as group leaders for two groups of children each, 10 in each group. A variety of therapeutic activities and discussions of the childrens' problems are carried out. Youth leaders are under direct supervision of a professional staff of psychologists, social workers, and psychiatrists.
Duration: September 1965-August 1969.
Investigator(s): Lonnie E. Mitchell, Ph.D., Director, Baker's Dozen Community Mental Health Center for Adolescents, 1511 4th St., N. W., Washington, D. C.
Cooperating group(s): Howard University; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Manual, Training for Community Mental Health Aides, Leaders for Child and Adolescent Therapeutic Activity Groups, Institute for Youth Studies, Howard University, Washington, D. C.

20-RZ-1 IDENTIFICATION AND DESCRIPTION OF EDUCATIONAL TECHNIQUES SUITABLE FOR PARENTS OF LOWER CLASS FAMILIES

Purpose: To develop educational techniques which would prove effective in training lower class mothers in psychological concepts and psychological mindedness, with special focus on understanding and managing the school dropout.
Subjects: Mother-child pairs of lower class families.
Methods: Group, psycho-educational meetings with parents and children; assessments of attitudes and psychological mindedness.
Duration: February 1965-1967.
Investigator(s): John F. Scott, Ph.D., Program Administrator, Worcester Youth Guidance Center, 275 Belmont St., Worcester, Mass. 01604. (Reported by Sebastiano Santostefano, Ph.D., Director of Research, Worcester Youth Guidance Center.)

HEALTH SERVICES

20-SA-1 FOLLOW-UP STUDY

Purpose: To evaluate the work done at the Children's Service Center in residence from January 1943 until December 1964.
Subjects: Children in residence who fall into the following categories: autistic, brain damaged, retarded, personality disorder, or adjustment reaction of childhood or adolescence.
Methods: Each case history is reviewed and pertinent information applied to questionnaire, which is then reviewed and checked by telephone, personal interview, or letter to the parents, or other sources to find out how the child has adjusted socially, academically, etc. The information from the replies received is then typed on index cards and filed.
Duration: October 1964-June 1967.
Investigator(s): Alice Doran, B.A., Research Assistant, Children's Service Center of Wyoming Valley, Inc., 335 S. Franklin St., Wilkes-Barre, Pa.
Publication: Report to be available from the Children's Service Center.

20-SA-2 HOW FAMILIES USE COMMUNITY SERVICES TO MEET THE HEALTH AND WELFARE NEEDS OF CHILDREN

Purpose: To develop a population sampling and interview procedure for determining extent to which community health and welfare services are meeting needs of families with children, and for identifying factors influencing effective utilization of community services by families with children; to demonstrate and evaluate usefulness of this procedure in the work of community planning groups in two contrasting types of communities.
Subjects: 600 families (300 in each of two communities) with children in one of three stages of development: infancy (approximate age of one year); school entrance (first grade, approximate age of six years), or puberty (ninth grade, approximate age of 14).
Methods: Sample frame constructed from birth certificates and school rosters and stratified by ecological area of residence; sample of families to be interviewed selected by random numbers, informant for interviews being mother of child (or other adult female responsible for care of child); data collected through interview instrument designed to elicit through both structured and open-ended questions pertinent facts concerning need for and utilization of community social services, with particular regard to children; questionnaire administered by trained and experienced caseworkers; evaluation made concerning use of this data collection analysis in the community planning process; and recommendations made concerning use of this or similar procedures.
Duration: September 1965-August 1966.
Investigator(s): Robert B. Reed, Ph.D., Proessor of Biostatistics, Harvard School of Public Health, Boston, Mass. (Reported by Reginald Robinson, Ph.D., Executive Director, Massachusetts Committee on Children and Youth, 9 Newbury St., Boston.)
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

20-SA-3 PATTERNS OF PHYSICIAN-USE FOR CHILDREN IN A SUBURBAN POPULATION

Purpose: To describe parental statements concerning use of physician services for children, extent to which emotional or behavioral problems are explicitly involved in these services, and extent to which other sources of help are utilized for these same kinds of problems; to examine relationship between these patterns and parent-respondent's conception of "good health" in children; and to examine relationship between these patterns and social characteristics of parent-respondent.
Subjects: A probability sample of households in a suburban county.
Methods: Survey methods of data collection and analysis.
Findings: A majority of parents use a general practitioner for their children. These parents do not differ in total family income from those who use pediatricians. Parents who do not have a regular family doctor for their children tend to be lower class, as measured by occupational prestige, education, and income.
Duration: August 1963-winter 1966.
Investigator(s): Ann C. Maney, Ph.D., National Institute of Mental Health, Mental Health Study Center, 2340 University Blvd. East, Adelphi, Md. 20783.
Cooperating group(s): National Opinion Research Center.
Publication: Journal articles.

20-SA-4 EVALUATION OF THE HEALTH SERVICES FOR DISADVANTAGED YOUTH PROJECT

Purpose: To evaluate efficacy of a program of health services that seeks to encourage positive orientations towards personal health among low income adolescents by providing them with a new form of medical service, which involves organizing examination and treatment services, in a hospital setting, to approximate the private doctor-patient relationship.
Subjects: Enrollees in the Neighborhood Youth Corps in New Jersey.
Methods: Students are given a self-administered questionnaire to determine attitudes and experiences they bring to the project, then examined, interviewed after examinations, and, where applicable, also after treatment has begun. This information is then supplemented by direct observation. Interviews are also conducted with participating medical personnel to discern form of organization and its consequences for the health attitudes of subjects.
Duration: August 1965-August 1967.
Investigator(s): Bernard Goldstein, Ph.D., Associate Research Specialist, and Joseph M. Conforti (Ph.D., Candidate), Research Associate, Urban Studies Center, Rutgers University, 137 Church St., New Brunswick, N. J.
Cooperating group(s): The New Jersey State Department of Health; Opinion Research Corporation of Princeton N. J.; Office of Economic Opportunity.

20-SA-5 QUALITY OF MEDICAL DATA ON BIRTH RECORD SUPPLEMENTS

Purpose: To study completeness and accuracy of data on the birth certificate and confidential medical supplement and the extent to which completeness and accuracy are related to hospital characteristics and procedures; to attempt to determine practical implications of errors; to prepare reports and recommendations for hospitals and vital statistics offices in procedural and administrative areas for improvement of medical and vital records.
Subjects: Live births occurring in Minnesota during 1966.
Methods: Registered births are sampled, and field investigators are sent to hospitals to abstract information from clinical records. Abstracts are

then compared with information originally recorded on vital records to form basis for study conclusions. Hospitals are pre-surveyed to determine characteristics and procedures.
Duration: February 1966-December 1968.
Investigator(s): Abraham B. Rosenfield, M.D., M.P.H., Director, Division of Special Services and Acting Chief, Section of Maternal and Child Health, and Robert W. Hiller, M.S., Chief, Section of Vital Statistics, Minnesota Department of Health, University Campus; and J. E. Bearman, Ph.D., School of Public Health, University of Minnesota, Minneapolis, Minn. 55440.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

20-SD-1 NATIONAL SPEECH AND HEARING SURVEY

Purpose: To estimate prevalence of speech and hearing disorders in school children; to analyze speech and hearing disorders in terms of age, grade, sex, and other related variables.
Subjects: Cluster sample of subjects in public and private schools in grades 1-12. Approximately 120,000 subjects are to be screened.
Methods: Screening methods for speech and language behavior; air conduction thresholds for hearing. Trained evaluators to be used in teams; use of mobile testing units being considered.
Duration: June 1965-July 1969.
Investigator(s): Forrest M. Hull, Ph.D., Associate Professor, Department of Hearing and Speech Science, Colorado State University, Fort Collins, Colo. 80521.
Publication: Results will probably be published through U. S. Office of Education or as monograph in a professional journal series.

20-SG-1 A STUDY OF PROTRUSIONAL LISPS TO IDENTIFY CHILDREN REQUIRING SPEECH THERAPY

Purpose: To develop a profile of statistically significant factors that, in a general sampling of a primary grade school population, will differentiate those children whose protrusional lisps will correct as they grow older from those who will need the help of a speech therapist to achieve normal speech.
Subjects: Kindergarten children who exhibit a protrusional lisp.
Methods: Use of a number of tests: articulation, motor proficiency, auditory acuity, auditory monitoring ability, social maturity, intelligence, psycholinguistic ability, health, and orthodontic examinations. No child is enrolled in therapy; at the close of a four-year period, subjects are divided into two groups: those who no longer lisp and those who retain their lisp.
Duration: September 1964-June 1969.
Investigator(s): Kathleen Pendergast, Supervisor of Speech and Hearing, Special Education Department, Seattle Public Schools, 815 4th Ave. N., Seattle, Wash. 98109.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

20-SG-2 REDIRECTION OF SCHOOL NURSING SERVICES IN CULTURALLY DEPRIVED NEIGHBORHOODS

Purpose: To determine if a planned program of personal contacts by the

school nurse with parents of kindergarten and first grade pupils, both at school and in the home, in culturally diverse neighborhoods, will increase parental action toward maintenance and promotion of the health of the school child and the prevention of illness.
Subjects: 2,000 pupils from three elementary schools; pupils in three other schools used as controls.
Methods: Non-nurse assistants working under direct supervision of school nurse are assigned selected routine functions ordinarily performed by qualified school nurses in experimental schools. Services of school nurse in experimental schools are being redirected to include routine home visits, parent education study groups, child supervision, and planned coordinated follow-up of health problems at home, at school, and in community. Time and activity studies by both nurse and nurse assistants are administered at selected intervals. Detailed health records are kept on 2,000 study pupils for 18 months.
Duration: 1966-1967
Investigator(s): Doris S. Bryan, R.N., Ph.D., Supervisor of Nursing Services, Department of Health Services, Oakland Public Schools, 1025 2nd Ave., Oakland, Calif. 94606.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

20-SJ-1 A CLINICAL RESEARCH PROGRAM FOR ORAL-FACIAL-COMMUNICATIVE DISORDERS

Purpose: To study the numerous aspects of oral-facial-communicative disorders, with particular reference to cleft lip and cleft palate.
Subjects: Patients with oral-facial-communicative disorders.
Methods: Program includes projects related to surgery, dentistry, orthodontia, prosthodontia, speech, hearing, psychology, social work, and pediatrics--all on the clinical aspects. The biological etiologies include work in chromosome analysis, teratology, and biochemistry.
Duration: October 1964-continuing.
Investigator(s): Herbert K. Cooper, Sr., D.D.S., Director; M. Mazaheri, D.D.S., Chief of Dental Services; Robert Millard, M.A., Director of Speech; and David Coursin, M.D., Director of Research, Lancaster Cleft Palate Clinic, 24 N. Lime St., Lancaster, Pa. 17602.
Cooperating group(s): National Institute of Dental Research, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Publication planned for appropriate journals.

20-SJ-2 CAUSAL RELATIONSHIPS BETWEEN TYPE II MALOCCLUSIONS AND SPEECH ANOMALIES

Purpose: To conduct a formal investigation of above problem that should result in: (1) a more comprehensive medical-dental service to children in Pennsylvania; (2) a more effective expenditure of available funds; and (3) a worthwhile contribution to research literature in communication disorders.
Subjects: 45 children with mixed dentition in grades three through five. All subjects must exhibit Type II malocclusions, have four to eight defective speech sounds, and an intelligibility rating of poor by a trained, professional listener using a rating scale.
Methods: Subjects are randomly assigned to three groups of 15 each. One group receives both orthodontic treatment and speech therapy; one group receives only speech therapy; and one group receives no treatment.
Duration: March 1966-June 1968.
Investigator(s): Daniel J. West, M.S., Speech Therapist, Schuylkill

County Public Schools, Pottsville, Pa. (Reported by Kathryn Dice Reier, Director, Bureau of Special Services for Pupils, Pennsylvania State Department of Public Instruction, Harrisburg, Pa.)
Cooperating group(s): Division of Dental Health, Department of Health, Commonwealth of Pennsylvania.
Publication: Publication planned in appropriate professional journals.

20-SM-1 MOBILE UNIT FOR CHILD HEALTH SUPERVISION

Purpose: To compare results, into school age if possible, of comprehensive well baby care and counseling from birth to three years of age in a group of normal firstborn infants with results in a similar group of infants who receive current well baby care provided in clinics of Washington, D. C.
Subjects: 30 to 50 infants in experimental group and a similar control group.
Methods: Mothers expecting first babies in the low income area in environs of Children's Hospital are randomly divided into two groups. The experimental group receives comprehensive care and counseling prenatally and postnatally for the infants via a self-propelled coach which goes to the homes. Group psychiatric counseling is provided for mothers. The control group is given appointments for a neighborhood clinic. The two groups are to be compared at regular intervals as to physical and mental health, social development, language skills, behavior problems, etc. All data are tabulated and scored for statistical analysis on IBM cards.
Duration: May 1965-1971.
Investigator(s): Margaret F. Gutelius, M.D., Director, Child Health Center of Children's Hospital, and Associate Professor of Pediatrics, George Washington University, Washington, D. C.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Publication in appropriate journals.

20-SM-2 PROGRAMMED INSTRUCTION IN PRENATAL AND INFANT CARE

Purpose: To determine value of programmed education in comparison to ordinary methods of instruction of high risk patients in value of adequate prenatal and infant care.
Methods: Subjects are pre- and post-tested, and compared with suitable control subjects exposed to usual "prenatal class" type of instruction.
Investigator(s): D. A. Cruise, M.D., Nebraska State Health Department, Lincoln; and Robert H. Messer, M.D., Assistant Professor of Obstetrics and Gynecology, College of Medicine, University of Nebraska, Omaha, Nebr.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

20-SM-3 PREVENTIVE AND THERAPEUTIC INFANT CARE IN PRIVATE OFFICES

Purpose: To investigate practicability of providing Health Department-financed well child supervision in offices of private physicians who provide sick care for same child and family; to investigate and evaluate quality of care given under the two conditions to determine differences between the two groups; and to evaluate impact of engaging in such a program by participating physicians in terms of their acceptance of such

a service and how participation may have changed their well child care. Methods: Study of the following: health status of child; mother's learning experience and her expressed needs and feelings; actions of physicians and nurses involved; utilization of services by patient as noted in medical record; use of public health nurse; and program administration and comparative costs.
Investigator(s): B. Otis Cobb, M.D., Alameda-Contra Costa Medical Association; and Henrik L. Blum, M.D., Health Officer, County of Contra Costa, Oakland, Calif. 94618; and John A. Knowles, M.D., School of Medicine, University of Arkansas, Little Rock, Ark.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

20-SM-4 STUDY OF PARENTAL CONCERNS IN WELL-CHILD SUPERVISION

Purpose: To identify needs and concerns of parents who bring their children to a child health conference.
Subjects: 198 mothers with first children under one year of age, presenting at one of several child health conferences in lower Michigan in Phase I; 51 of the same in Phase II.
Methods: Phase I, a structured attitude-measurement instrument in a card sort format, plus an objective questionnaire; in Phase II, same instruments plus unstructured, in-depth home interview.
Findings: The card sort technique has proven useful, readily acceptable and reliable in the automatic processing of data onto punched cards. Attitudes indicated are less strongly related to socio-economic variables than might be expected. Needs can be described in three categories: medical problems, child care practices, and role of motherhood.
Duration: October 1963-continuing.
Investigator(s): Winifred Connelly, R.N., M.P.H., Research Associate, School of Public Health, University of Michigan, Ann Arbor, Mich. (Reported by Donald C. Smith, M.D., Professor of Maternal and Child Health, School of Public Health, University of Michigan.)
Cooperating group(s): Ann Arbor Child Health Center; Washtenaw, Wayne County, and Central Michigan Health Departments; St. Joseph Mercy Hospital, Ann Arbor.
Publication: Publications in preparation.

20-SM-5 STUDY OF HOME CARE FOR PREMATURE INFANTS IN ARKANSAS

Purpose: To assess effectiveness of a home care program for premature infants.
Subjects: Approximately 200 premature infants born in two Arkansas counties.
Methods: Records of public health nurses visiting these infants in their homes were analyzed extensively.
Duration: Not reported-August 1965.
Investigator(s): Johan W. Eliot, M.D., M.P.H., Assistant Professor of Maternal and Child Health, School of Public Health, University of Michigan, Ann Arbor, Mich. (Reported by Donald C. Smith, M.D., Professor of Maternal and Child Health, School of Public Health, University of Michigan.)
Cooperating group(s): Division of Maternal and Child Health, Arkansas State Board of Health.
Publication: Publications in preparation.

20-SM-6 CONTINUITY AND FRAGMENTATION IN A PEDIATRIC OPD CLINIC

Purpose: To study the problems of continuity and fragmentation of care, and develop techniques and measures for the evaluation and comparison of the effectiveness of various approaches, with the objective of providing better pediatric clinic services.
Subjects: Children of low income families.
Methods: Demographic and health data are obtained on clinic population; present clinic organization, services, and functioning of personnel are studied, and patient's perception of his medical needs, and means of obtaining parent participation are explored.
Duration: December 1965-November 1966.
Investigator(s): Theodore J. DiBuone, M.D., Assistant Professor of Pediatrics and Coordinator, Pediatric Referral Center, and Howard L. Weinberger, M.D., Assistant Professor of Pediatrics and Associate Director, Pediatric OPD Clinic, Upstate Medical Center, State University of New York, Syracuse, N. Y. 13210.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

20-SN-1 ATTITUDES AND PRACTICES RELATING TO FAMILY PLANNING IN A LOWER CLASS URBAN COMMUNITY

Purpose: To investigate selected socio-economic and psycho-social correlates of contraceptive use, attitudes toward family planning, and birth rate in an urban population. Also, to examine use of prenatal facilities.
Subjects: 1,141 mothers, stratified for race and use of private medical care, otherwise randomly selected. 829 were Negro. Of these 281 were unmarried, providing a significant number of cases for special study.
Methods: Interviews were conducted by public health nurses who ordinarily work in the health district in which the mothers live. Data were collected on income, education, use of prenatal facilities, religious identification, attitudes toward change of socio-economic status, etc. Along with these data, information was obtained on past contraceptive use and plans for the future, so that it was feasible to formulate a scale regarding intensity of attitudes about family planning. The second round of interviews, 18 months later, specifically contained items regarding subsequent pregnancies and their outcome. Data are being processed using both descriptive survey techniques and multivariate statistics to describe significant features of the population and to predict attitudes toward family planning of homogeneous subgroups.
Findings: Estimation of mothers' attitudes may be reliably obtained via interview. These attitudes vary, as expected, with race, religion, and marital status. Within each homogeneous subgroup (e.g., single, Negro, non-Catholics) attitudes toward contraception and family planning may be significantly predicted from a combination of sociologic and economic factors.
Duration: 1963-1966.
Investigator(s): Gerald Wiener, Ph.D., Associate Professor; Paul White, Ph.D., Assistant Professor; and Toby Milton, M.A., Instructor, Department of Population and Family Health, School of Hygiene and Public Health, Johns Hopkins University, Baltimore; and Wilson Wing, M.D., Director, Eastern Health District, Baltimore City Health Department, Baltimore, Md. (Reported by Paul A. Harper, M.D., M.P.H., Professor of Maternal and Child Health, Department of Population and Family Health.)
Cooperating group(s): Western Health District, Baltimore City Health Department.

20-SN-2 MICHIGAN INTRAUTERINE CONTRACEPTIVE STUDY

Purpose: To measure the acceptability, effectiveness, and side effects of intrauterine devices as a method of birth control among the socially disadvantaged.
Subjects: Approximately 1,500 women who have registered as patients of two clinics in Detroit.
Methods: Clinic locations, medical techniques, staffing, fees are being developed to provide contraceptive services acceptable to all patients presenting themselves. Methods of publicizing the clinics are adapted to the most socially disadvantaged sectors of the population.
Findings: The intrauterine contraceptive devices are an acceptable and effective method of birth control among the socially disadvantaged.
Duration: July 1963-November 1966.
Investigator(s): Ralph Ten Have, M.D., M.P.H., Research Associate in Maternal and Child Health, School of Public Health, University of Michigan, Ann Arbor, Mich. (Reported by Donald C. Smith, M.D., Professor of Maternal and Child Health, School of Public Health, University of Michigan.)
Cooperating group(s): Planned Parenthood Federation of Detroit.
Publication: Proceedings of the Second International Conference on Intrauterine Contraception, New York, 1964, Excerpta Medica Foundation, Amsterdam; article in American Journal of Public Health; other articles to be published.

20-SN-3 WEST PAKISTAN RESEARCH AND EVALUATION CENTER

Purpose: To study population dynamics and family planning in selected populations in West Pakistan; to help the Commissioner of Family Planning evaluate operation of Family Planning Scheme under Third Five Year Plan.
Subjects: Women of child-bearing age and their families in a village of 12,000 people.
Methods: Interviews to obtain demographic data and knowledge of and attitudes toward family planning; census every 9 to 12 months and systems for registration of births; clinic records of contraceptive services, especially intrauterine devices, vasectomy, and oral contraceptives.
Duration: March 1960-1968.
Investigator(s): Rowland V. Rider, Sc.D., and Paul A. Harper, M.D., Professors, Department of Population and Family Health, School of Hygiene and Public Health, Johns Hopkins University, Baltimore, Md. 21205.
Cooperating group(s): Population Council; Ford Foundation; Rockefeller Foundation; National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Population Dynamics, Muramatsu and Harper (Eds.), Baltimore: The Johns Hopkins Press, 1965.

20-SS-1 DIAGNOSTIC CHECK POINT

Purpose: To acquire pertinent information on interdependent individual child, family and school systems by converting kindergarten year of school into a partnership venture between school and psychiatric services; and to feed back information in a continuous dialogue with principal, teachers, etc.
Subjects: Originally, 135 children in one school, to be expanded to four schools, with the eventual goal the total elementary school population of catchment area.
Methods: Psychological tests: Gesell School Readiness Battery, It Test,

and Mackie's Color Discrimination Test; registration interview; social case work; consultation.
Duration: April 1965-indefinite.
Investigator(s): Frank T. Rafferty, M.D., Associate Professor of Psychiatry, and Director, Division of Child Psychiatry, Psychiatric Institute; and James B. Mackie, Ph.D., Assistant Professor of Medical Psychology, University of Maryland, 645 W. Redwood St., Baltimore, Md. 21201.
Cooperating group(s): Baltimore City School System; Friends of Psychiatric Research; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: "The Diagnostic Check Point for Community Child Psychiatry," American Psychiatric Association Regional Research Conference; Epidemiology and Mental Health Planning, April 1966, Psychiatric Institute, University of Maryland. In press.

20-SS-2 THE NURSERY SCHOOL IN PREVENTIVE MENTAL HEALTH

Purpose: To study behavioral changes in children and families as related to mental health factors, such as basic trust, autonomy, initiative, cognitive and social development; to study family utilization of community resources and participation in community activities.
Subjects: A cross-cultural sample of 60 families composed of middle and lower income, Negro, white, and Oriental.
Methods: Utilization of a nursery school setting as a medium for developing in a unitary manner positive mental health factors in the families involved.
Duration: September 1965-September 1970.
Investigator(s): Mary B. Lane, Ed.D., and John Connelly, M.A., Professors of Education, San Francisco State College, 1600 Holloway, San Francisco, Calif. 94127.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

20-SS-3 STUDIES OF DECISION-MAKING IN PSYCHIATRY--PHASE 1

Purpose: To investigate the role of specific factors affecting diagnostic decision-making in psychiatry.
Subjects: 150 psychiatric case records of children ages three to 18, in a child guidance facility. 150 children in a comparable child facility to be used as a validating study.
Methods: Analysis of structure and content of psychiatric case records and of written decisions made by the clinician in regard to data collection; influence of certain variables such as age, symptom of the patient, number, sex, age and psychiatric history of the informants, degree of experience of the clinician, etc., correlated with preliminary decisions; inter-relationships between preliminary and later decisions elucidated. Each case record is transcribed into computer acceptable form by the psychiatric case history and event system, a generalized information processing system developed by the investigators. Subsequently, data in the records are subjected to quantitative and qualitative analysis.
Duration: November 1965-October 1967.
Investigator(s): Bernice T. Eiduson, Ph.D., Director of Research, Reiss-Davis Child Study Center, 9760 W. Pico Blvd., Los Angeles, Calif. 90035.
Cooperating group(s): San Fernando Valley Child Study Center; National

Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Behavioral Science 11:2:133-142, March 1966.

20-SS-4 BRIEF FAMILY THERAPY DEMONSTRATION PROJECT

Purpose: To demonstrate feasibility and effectiveness of a program of brief family therapy in a large metropolitan hospital serving predominantly families of low economic and social status; to elaborate and test criteria for selection of families for brief family therapy; and to evaluate the prophylactic potential of such an approach for younger family members.
Subjects: Late adolescents and adults as original patients, and their families.
Methods: Up to 15 sessions of problem-oriented therapy, utilizing such evaluative measures as the FIRO-B, the Hill Interaction Matrix, the Family Interaction Apperception Test, staff attitude questionnaires, and clinical appraisals.
Investigator(s): C. J. Sager, M.D., Chief, and T. L. Brayboy, M.D., Associate Chief, Family Treatment and Study Unit, New York Medical College-Metropolitan Hospital Medical Center, 1901 First Ave., New York, N. Y.
Cooperating group(s): Public Health Service, U. S. Department of Health, Education, and Welfare.

20-SS-5 STUDY OF SERVICES FOR EMOTIONALLY DISTURBED CHILDREN IN ALLEGHENY COUNTY, PENNSYLVANIA

Purpose: To compile data on extent of emotional disturbance among children in Allegheny County and on nature and quantity of existing services designed to meet the problem; to develop an overall community plan for provision of additional services needed, and for coordination of all services.
Subjects: All resources treating emotionally disturbed children by organizational and private practitioner located in Allegheny County and serving children between January and December 1965.
Methods: Estimate of prevalence on basis of previous studies and national prevalence estimates; mail survey of organizations to collect information on personnel, budget, facilities, type and quantity of service provided, number and characteristics of children served; mail survey of private practitioners to determine extent and nature of practice; review of material by professional panels; development of recommendations by ad hoc citizens' committee.
Duration: October 1965-June 1967.
Investigator(s): Mary B. Janavitz, M.A., Planning Director, and Paul A. Hummer, M.A., Research Associate, Health and Welfare Association of Allegheny County, 200 Ross St., Pittsburgh, Pa. (Reported by Camille Lambert, Jr., Ph.D., Research Director, Health and Welfare Association of Allegheny County.)
Cooperating group(s): Office of Mental Health, Pennsylvania State Department of Public Welfare; University of Pittsburgh; inpatient and outpatient treatment facilities for emotionally disturbed children.
Publication: Health and Welfare Association publication, available at cost, approximately June 1967.

20-SS-6 CHILDHOOD PREDICTORS OF THE LEVEL OF DEMAND FOR VETERANS ADMINISTRATION SERVICES

Purpose: To find childhood factors that predict extensive use of Veterans Administration facilities.
Subjects: A sample of Negro men of normal intelligence, born in St. Louis, and who attended St. Louis public schools.
Methods: School and service records of subjects are abstracted to obtain information on kinds and extent of service requested and childhood factors predicting these needs.
Duration: 1965-1968.
Investigator(s): Lee N. Robins, Ph.D., Research Associate Professor in Sociology, Department of Psychiatry, Medical School, Washington University; and Thomas D. Hartnett, M.D., Assistant Chief, Psychiatry and Neurology Service, Veterans Administration Hospital, 915 N. Grand Blvd., St. Louis, Mo. 63106.
Cooperating group(s): Veterans Administration.

20-SS-7 A MENTAL HEALTH STUDY IN COLLEGE PREPARATORY SCHOOLS

Purpose: To determine whether student "problem withdrawals" can be reduced by early detection and appropriate preventive and treatment measures.
Subjects: 400 ninth grade students predicted on a pretested rating scale to experience major difficulties in trying to stay in their respective schools.
Methods: Students are assigned by random assortment to experimental or control category and experimental students are singled out for psychiatric help. Names of control students are kept secret. All students will be followed for five years to compare problem withdrawals of experimentals and controls. In addition, overall problem withdrawal rates for each of the seven schools were recorded for three years prior to the study and are being recorded during the study to see whether the presence of a psychiatrist in a school appears to influence these rates.
Findings: An unanticipated finding, based on supplementary study of the social structure of each school and the way the psychiatric program in each school developed, is that definitions of the proper function of the psychiatrist in the school vary in patterned ways from one school to another.
Duration: February 1965-1970.
Investigator(s): Benjamin H. Balser, M.D., Director, Research and Training; Robert S. Mumford, M.D., and Abraham A. Chaplan, M.D., Assistant Attending Psychiatrists, Department of Psychiatry, St. Luke's Hospital, 421 W. 113th St., New York, N. Y.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Psychology in the Schools 3:1:6-16, January 1966; paper to be presented at meeting of American Psychiatric Association, May 1967.

20-SV-1 THE PSYCHOLOGICAL EFFECT OF BODILY ILLNESS IN SMALL CHILDREN

Purpose: To investigate immediate psychological effects of physical illness, not requiring hospital admission, upon behavior of preschool children; to study possible effects of age and sex of child and of severity of illness upon his reaction to illness; to determine whether behavior patterns of acute and convalescent phases of the illness are separate and distinct.

Subjects: 20 boys and 20 girls between the ages of two and four years, who suffer from an acute illness for which they are being nursed at home by their mothers.
Methods: Nature and severity of the children's illnesses will be determined by the pediatrician, who also gives continuous medical attention to the children. Daily observations of the behavior of the sick children will be made and recorded by their mothers who will follow an outline covering, e.g., changes in mood, motility, verbalization, activity pattern, interaction with familiar persons and objects, etc. The psychiatrist will make a home visit immediately after acute phase of sickness in order to collect and complete data regarding the child's reaction. Approximately half of sample will be investigated during a second illness to ascertain whether children's reaction to first illness was characteristic for them rather than a specific reaction to a specific illness. The Vineland Social Maturity Scale and Anna Freud's Concept of Developmental Lines will be used in order to assess children's pre-illness social and emotional maturity.
Findings: Most children show two major types of reaction: either withdrawing from environment, appearing seriously ill despite often mild infectious illnesses, or becoming clinging, demanding, wanting a surplus of attention from their mothers (implying regression in object relationships); regardless of severity of illness, a preschool child seems to react in a similar way during repeated illnesses at home; convalescent phase is almost always associated with transient whiny, demanding, impatient attitudes towards environment, especially the mother.
Duration: February 1965-continuing.
Investigator(s): Ake Mattsson, M.D., Instructor in Child Psychiatry, and Israel Weisberg, M.D., Assistant Professor of Pediatrics, Western Reserve University School of Medicine, Cleveland, Ohio 44106.
Publication: To be published in a pediatric and a psychiatric journal.

RESEARCH NOTES

BIBLIOGRAPHY ON DEAFNESS

The Alexander Graham Bell Association for the Deaf, 1537 - 35th Street, N. W., Washington, D. C. 20007, recently published its *Bibliography on Deafness*, a cumulative index of articles selected from the *Volta Review* and the *American Annals of the Deaf*. The book is available from the Association for $3.50 in paperbound edition and $10.00 for the casebound.

CENTER FOR STUDY OF UNEMPLOYED YOUTH

The Center for the Study of Unemployed Youth has been established as a part of the Graduate School of Social Work of New York University. It is concerned with training, consultation, curriculum development, and research relating to the employment problems of disadvantaged youth. Further information may be obtained from the Center, located at 853 Broadway, New York, N. Y. 10003.

CORRECTIONAL MANPOWER AND TRAINING

The Joint Commission on Correctional Manpower and Training, a private, non-profit organization, has begun a program of research and study of personnel practices and current and projected personnel needs in correctional rehabilitation. A major portion of the study will be devoted to education of manpower for effective work in corrections. Included in the study will be an evaluation of the effectiveness of present methods of recruiting, selecting, and utilizing personnel. The work of the Commission encompasses both the juvenile and adult correctional fields. Further information may be obtained by writing to the Commission at 1522 K Street, N. W., Washington, D. C. 20005. (*Child Welfare*, October 1966, pp. 464-466).

LAW ENFORCEMENT ASSISTANCE ACT

Under the Law Enforcement Assistance Act of 1965 (P.L. 89-197--LEAA), the Department of Justice is authorized to award federal funds for projects which "may create, experiment with, test or demonstrate new knowledge or techniques in crime prevention, crime detection, law enforcement, and the administration of criminal justice and corrections." For further information write to the Office of Law Enforcement Assistance, U. S. Department of Justice, Washington, D. C. 20530.

Sociological Abstracts, Leo P. Chall, 225 W. 86th St., New York, N. Y. 10024.

Through the Educational Research Information Center, better known as ERIC, reliable current research and research-related information will be made available to teachers, administrators, researchers, commercial organizations, and others. ERIC also includes twelve clearinghouses, or documentation centers, located at universities and other institutions throughout the country. Each clearinghouse will concentrate on a different subject-matter area. As of July 1966, ERIC had published two indexes-- Catalog of Selected Documents on the Disadvantaged: a Number and Author Index (OE-37001) and a Subject Index (OE-37002). These are available from the U. S. Government Printing Office, Washington, D. C. 20402, for $0.65 and $3.00, respectively. More complete information may be obtained by writing to the Director of ERIC, Office of Education, U. S. Department of Health, Education, and Welfare, Washington, D. C. 20202.

The Excerpta Medica Foundation, New York Academy of Medicine Building, 2 E. 103rd St., New York, N. Y. 10029, has established an abstracting service on pediatrics on a yearly subscription basis. In addition to abstracts, the Foundation can provide to subscribers, at cost, photocopies and translations of complete articles.

Harvard University Graduate School of Education now operates a Clearinghouse on Educational Differences. Its purpose is to serve as a center of information in the area of individual differences in education, with special attention on materials dealing with learning, cognition, child development, achievement and personality traits as they relate to education. The Clearinghouse has prepared a number of acquisitions lists and bibliographies, and also plans to publish a news letter. For information on their services, write to them at Harvard University, Larsen Hall, Appian Way, Cambridge, Mass. 02138.

The Human Relations Area Files have classified cultural data on primitive and non-primitive societies into 710 categories of human behavior. Complete sets of all files are available in 22 member institutions in the United States. For information, write to Dr. Clellan S. Ford, President, Human Relations Area Files, Yale University, New Haven, Conn. 06520.

The Minnesota Family Study Center can supply to interested scholars bibliographic information from the Inventory of Published Research in Marriage and Family Behavior. Requests for information should be addressed to the Director, Inventory of Published Research in Marriage and Family Behavior, Social Science Tower 1026, University of Minnesota, Minneapolis, Minn. 55455. (Journal of Marriage and the Family, May 1966, p. 142).

The Library of the National Society for Crippled Children and Adults has initiated a photoduplication service for persons engaged in rehabilitation research. It is available without charge to personnel in educational or research institutions and health or welfare agencies, public or private. This service hopes to provide the necessary professional literature not available in local libraries. Further information may be obtained by writing to the Librarian of the Society, 2023 W. Ogden Ave., Chicago, Ill. 60612. (Rehabilitation Literature, April 1966, p. 109).

The Science Information Exchange, Smithsonian Institution, 209 Madison National Bank Bldg., 1730 M St., N. W., Washington, D. C. 20036, provides to qualified investigators on request selected abstracts of current research supported by foundation or government grants. The Exchange covers such fields as medicine, nursing, public health, nutrition, psychology, education, anthropology, mental health, and intercultural relations.

The World Federation for Mental Health, 19 Manchester St., London W.1, England, operates a clearinghouse for research and study projects in the field of mental health.

> In addition to these journals and services, many professional journals in such fields as pediatrics and mental deficiency include a section of abstracts regularly or once a year. There are also a number of indexes and abstracting journals in the medical area which occasionally refer to materials in the area of child development.

THE CHILDREN'S BUREAU
AND ITS
CLEARINGHOUSE FOR RESEARCH IN CHILD LIFE . . . .

The Children's Bureau was established in 1912 to "investigate and report. . . . upon all matters pertaining to the welfare of children and child life among all classes of our people." From this beginning, the Bureau has extended its activities into such areas as developing standards of care for children and providing funds to States to improve conditions for children. More recently, the Bureau has established several new grants programs to support research in areas of maternal and child health and child welfare.

In keeping with the basic Act establishing the Bureau, the Clearinghouse for Research in Child Life was set up in 1948. Its function is to collect information about current research relating to children in order to make such information available for the use of investigators, administrators, program planners, and practitioners.

Investigators reporting a study to the Clearinghouse receive a free copy of the issue of *Research Relating to Children* in which their study appears. A free copy of each issue is also sent to directors of research centers and to libraries. In addition, the Clearinghouse maintains a mailing list of interested persons who receive announcements of new issues as they are published. Individuals may purchase copies from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

The Children's Bureau Clearinghouse routinely exchanges information with the Science Information Exchange of the Smithsonian Institution. This organization is very helpful in providing abstracts of research supported by federal funds and by many foundations.

The major source of information, however, is the individual research investigator, whose help is essential in obtaining the most complete and up-to-date coverage possible.

BEST COPY AVAILABLE

INSTRUCTIONS

Please report studies in progress (or recently completed) which:

center on children or their families in such areas as child growth and development, intelligence, personality, education, social adjustment, family life, physical and emotional disorders, etc.

concern service programs in the fields of child health, child welfare, or special education

Please *DO NOT* report:

studies already reported to the Clearinghouse

purely medical studies limited to morphology or physiology, the physical aspects of etiology, epidemiology or symptomatology of diseases or handicapping conditions, surgery, chemotherapy, antibiotics or physical therapy; biochemical or other laboratory studies; animal studies

educational studies of curriculum construction or materials, teaching methods, surveys of school facilities or needs, general school administration studies

studies already published in sources generally available in major libraries across the country

demonstration projects, unless there is a formal plan for evaluation

studies of test development, standardization, or validation, except for special groups of children such as blind or retarded

regularly collected material such as annual reports, work preparatory to writing handbooks; directories; research based on secondary sources

master's theses, unless they represent work beyond a doctorate, as in dentistry

CHILDREN'S BUREAU
CLEARINGHOUSE FOR RESEARCH IN CHILD LIFE
WASHINGTON, D C. 20201

If you or your colleagues are currently engaged in research on children or their families, we would greatly appreciate your cooperation in providing a short summary of your work for inclusion in the next issue of *Research Relating to Children.*

The Clearinghouse is the branch of the Children's Bureau which collects and disseminates information on current research relating to children and their families. Its purpose is to provide research investigators with information about other research in progress, to point up gaps in present research, and thereby to stimulate more effective research.

The instructions on the preceding page of this form will serve as a guide for your summary. You will, of course, receive a free copy of the issue in which your study appears.

If you know of others doing research which might be of interest to the Clearinghouse, please give name(s) and address(es) below:

____

____

Thank you for your cooperation.

Previous Issues of

RESEARCH RELATING TO CHILDREN

Single copies of the following issues are available without charge from the Clearinghouse for Research in Child Life, Children's Bureau, Welfare Administration, Department of Health, Education, and Welfare, Washington, D. C. 20201. (Dates indicate period during which studies were reported to us).

Bulletin II, Supplement 2 (November 1952-May 1954)
Bulletin II, Supplement 3 (April 1954-January 1955)
Bulletin II, Supplement 4 (February-November 1955)

The following issues are available for purchase directly from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402, at the prices indicated:

Bulletin 4 (May-September 1956) - 75 cents
Bulletin 9 (August 1958-February 1959) - $1.00
Bulletin 17 (February 1963-February 1964) - 75 cents
Bulletin 18 (March-December 1964) - $1.25
Bulletin 19 (January-September 1965) - $1.50

The following issues are OUT OF PRINT but are available in many libraries:

Bulletin I (December 1948-June 1949)
Bulletin I, Supplement 1 (July 1949-March 1950)
Bulletin I, Supplement 2 (April-July 1950)
Bulletin I, Supplement 3 (August-December 1950)
Bulletin I, Supplement 4 (January-April 1951)
Bulletin I, Supplement 5 (May-December 1951)

Bulletin II (January-October 1952)
Bulletin II, Supplement 1 (January 1952-March 1954)

Bulletin 3 (December 1955-April 1956)
Bulletin 5 (October 1956-February 1957)
Bulletin 6 (March-July 1957)
Bulletin 7 (August 1957-February 1958)
Bulletin 8 (March-July 1958)
Bulletin 10 (March-July 1959)
Bulletin 11 (August 1959-February 1960)
Bulletin 12 (February-July 1960)
Bulletin 13 (August 1960-January 1961)
Bulletin 14 (February-September 1961)
Bulletin 15 (October 1961-June 1962)
Bulletin 16 (July 1962-January 1963)

An investigator receives a free copy of the issue of Research Relating to Children in which his study appears. A free copy of each issue is also sent to directors of research centers and to libraries. In addition, the Clearinghouse maintains a mailing list of interested persons who receive announcements of new issues as they are published.

CLEARINGHOUSE FOR RESEARCH IN CHILD LIFE

For sale by the Superintendent of Documents, U.S. Government Printing Office
Washington, D.C., 20402 - Price $1.25

FOREWORD

This Bulletin, like previous issues, includes reports of research in progress or recently completed. With the exception of the long-term research, it does not report again studies included in Bulletins 3 through 20 even though they may still be continuing. This issue, therefore, does not reflect all research relating to children in a given period but only that which was first reported to the Clearinghouse June 1966 through April 1967.

The Clearinghouse has only such information about the studies as the abstracts provide. Publication references and plans are given by some of the investigators but the Clearinghouse does not maintain bibliographic information on published reports of the studies. The reader who wishes to obtain further details about any of the projects reported should check professional journals in the appropriate field or write directly to the investigator.

For the Clearinghouse, I wish to thank those who have submitted reports on their own projects and those who have told us of other studies, and to acknowledge the valuable assistance of the Science Information Exchange, and the foundations which provide us with information about their research grants.

Katherine B. Oettinger

Katherine B. Oettinger
Chief, Children's Bureau
SOCIAL AND REHABILITATION SERVICE

NOTE: Within the U.S. Department of Health, Education, and Welfare, the Welfare Administration has been superseded by the Social and Rehabilitation Service, and the Vocational Rehabilitation Administration is now the Rehabilitation Services Administration.

To Research Investigators:

This publication is only as complete as you are willing to make it. Page 171 is a form for letting us know of other investigators who are working in the field. Page 170 is a form for reporting your own current research. Please let us hear from you.

Clearinghouse for Research in Child Life

LONG-TERM RESEARCH

Note: The reports in this section
concern research programs which are
more or less continuous.

21-AA-1 GROWTH, DEVELOPMENT, AND ADAPTATION OF HUMAN INDIVIDUALS

Purpose: To gain greater understanding of many factors involved, prenatal and postnatal, as an individual is in the process of becoming the kind of a person he is as an adult.
Subjects: Approximately 100 middle class families in Denver, Colorado, including 210 offspring of whom over 50 are second generation followed in the institute. (80 percent of subjects entered since 1930 are still being followed.)
Methods: Each subject followed from birth at regular intervals studying: (1) pattern of changing structure by direct measurements, X-rays, and photographs; (2) development of personality traits, starting with family during prenatal period and carried on intensively with infant, child, and adult; (3) patterns of physiological development including nutrition, biochemical and physiological tests, and evaluation of healthiness.
Duration: 1927-continuing.
Investigator(s): Robert W. McCammon, M.D., Director, Child Research Council, University of Colorado, 4200 E. Ninth Ave., Denver, Colo. 80220.
Cooperating group(s): University of Colorado; Commonwealth Fund; McDonald Foundation; Nutrition Foundation; National Live Stock and Meat Board; Gerber Company; Lawrence Phipps Foundation; National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Appropriate medical or scientific journals every year. Publication lists available.

21-AA-2 **ANALYSIS AND EVALUATION OF DATA FROM THE LONGITUDINAL STUDY OF CHILD HEALTH AND DEVELOPMENT BASED UPON MULTI-DISCIPLINE AND PERIODIC OBSERVATIONS OF INDIVIDUAL CHILDREN FROM BIRTH TO 18 YEARS**

Initiation date: 1930.
Investigator(s): Research has been discontinued but the analyses of data and preparation of reports are being continued by individuals under the direction of Robert B. Reed, Ph.D., Professor of Biostatistics, Harvard School of Public Health, 55 Shattuck St., Boston, Mass. 02115.

21-AA-3 LONGITUDINAL STUDY OF CHILD GROWTH AND DEVELOPMENT

Purpose: Program consists of study of adult personality, adjustment and aging processes of individuals whose health, growth, personality development, and environment have been studied since birth. It included a study of the aging processes of their parents in relation to physical and biochemical measures made earlier. It will include studies of: parental child-rearing attitudes and practices of two generations in the same families; constancy of autonomic response patterns to stress from childhood to young adulthood and their relationship to psychosomatic disorders in adulthood; blood lipids in relationship to body composition and change in composition.
Investigator(s): Lester W. Sontag, M.D., Director, Fels Research Institute for the Study of Human Development, Antioch College, Yellow Springs, Ohio.
Cooperating group(s): Public Health Service, U. S. Department of Health, Education, and Welfare.

21-AA-4 LONGITUDINAL CROSS-CULTURAL STUDY OF HUMAN DEVELOPMENT

Purpose: To observe the long-term effects of environment upon growth and health, that is, the influence of environmental factors upon physical and mental development, and the elucidation of their mode of action and interaction with genetic endowment.
Subjects: Several hundred males followed from pre-puberty, all with four grandparents from the same limited geographical zone of southern Italy but now living in the markedly different cultures of Boston, Rome, and Palermo; other groups of 100 girls and several hundred boys in Florence, Italy and 200 girls in Boston.
Methods: Repeated medical, anthropometric and psychological examinations together with family interviews (with evaluation of child-rearing practices), nutrition, and socio-cultural data.
Findings: Reported in numerous articles in American and European journals. Current work under analysis includes cross-cultural study of moral values, studies of biological age and its estimation, estimation of socio-economic status across cultures, blood groups and temperament, and changing hemoglobin values in adolescent males. Work involving further and continuing data collection includes prediction of growth variables, cross-cultural study of creativity and its environmental determinants, a study of left-handed subjects in the relatively "permissive" and "intolerant" cultures of the United States and Italy, and an analysis of menstrual symptoms in both cultures.
Duration: 1956-1968.
Investigator(s): Harben Boutourline Young, M.D., Harvard Florence Research Project, Via Venezia 10, Florence, Italy.
Cooperating group(s): Grant Foundation; Wenner Gren Foundation; Olivetti Corporation; Universities of Florence, Rome, and Palermo.
Publication: Numerous journal articles; one book is planned, another possible.

21-AA-5 BIOLOGIC AND ENVIRONMENTAL FACTORS IN CHILD DEVELOPMENT

Purpose: To investigate the relationship of biologic, genetic, and environmental factors in the parents--including events during pregnancy, labor, and delivery--to normal and abnormal development of offspring. Expected byproducts of investigation are relationships of these factors to pregnancy wastage in the form of early fetal death, perinatal mortality, infant and childhood mortality, and estimates of incidence of different types of abnormalities. In addition, detailed growth curves for children from birth to six years of age will be derived on a longitudinal basis, and estimates of illnesses and injuries in infancy and the pre-school child will be derived.
Subjects: Members of the Kaiser Foundation Health Plan--a pre-paid medical care program--who reside in the San Francisco-East Bay area.
Methods: Study is of a prospective, longitudinal type for both mother and child. Observations are made on the gravidas in the Department of Obstetrics and Gynecology, and on the children in the Pediatric Department, and are supplemented by special interviews and laboratory examinations. Physicians' observations are systematized and made more uniform. Special efforts are made to obtain information on members of study who do not return to the plan for medical care.
Duration: July 1959-indefinite.
Investigator(s): Jacob Yerushalmy, Ph.D., Professor of Biostatistics, University of California, Berkeley; Alexander L. King, M.D., Director of Pediatrics; and Robert W. King, M.D., Consultant, Department of Obstetrics and Gynecology, Kaiser Foundation Hospital, Oakland, Calif. (Reported by C. H. Peckham, M.D., 3783 Piedmont Ave., Oakland, Calif. 94611.)
Cooperating group(s): Division of Biostatistics, School of Public Health, University of California; Permanente Medical Group; Kaiser Foundation Research Institute.
Publication: Yerushalmy, J., "Statistical Considerations and Evaluations of Epidemiological Evidence," in Tobacco and Health, Chas. C. Thomas, publisher, 1962. American Journal of Obstetrics and Gynecology 87:5:609-620, November 1, 1963; 88:4:505-518, February 15, 1964. Vox Sanguinis 8:376-377, May-June 1963; 8:549-556, September-October 1963; 9:502-504, 1964. Human Biology 36:2:86-103, May 1964. Obstetrics and Gynecology 24:5:707-715, November 1964. American Journal of Diseases of Children 109:43-57, January 1965.

21-AA-6 THE BERKELEY (CALIFORNIA) GROWTH STUDY

Purpose: A study of the mental and physical growth of approximately 50 normally healthy persons from birth in 1928-29 to the present (39 years).
Subjects: Full-term, healthy newborns, born in Berkeley, California hospitals of white, English-speaking parents, if parents were interested--a somewhat selected above-average group. 100 offspring of these subjects, age range from a few months to about 16 years, seen irregularly, but the same data (appropriate for age) are collected that were collected for their parents.
Methods: Tests of mental and motor development; pediatric examination; interviews at frequent intervals during growth beginning in first week of life. At all visits, inquiries made concerning current health and recent illnesses. Anthropometrics, body photographs, and skeletal X-rays taken at most ages. Socio-economic data available. Comparisons now being made on variety of collected data. Studies of physical aspects of children's growth include analyses comparing health histories with physical growth and with skeletal maturation. Some parent-child relations in susceptibility to illness could be studied. Emotional and other personality variables studied for consistency, and in various interrelations with maternal behavior in infancy, birth histories, socio-economic status, intellectual and physical growth.

Duration: 1928-continuing.
Investigator(s): Nancy Bayley, Ph.D., Institute of Human Development, University of California, 94720; and Dorothy H. Eichorn, Ph.D., Child Study Center, 2425 Atherton St., Berkeley, Calif. 94704.
Cooperating group(s): Institute of Human Development, University of California.
Publication: Studies in the Development of Young Children, University of California Press, 1940. Growth Diagnosis, University of Chicago Press, 1959. Child Development 12:167-173, 1941; 27:45-74, 1956. American Psychologist 10:805-818, 1955. Monograph, Society for Research in Child Development 28, 1963.

21-AA-7 MEDFORD, OREGON BOYS' GROWTH STUDY

Purpose: To construct cross-sectional, convergence, and longitudinal growth and acceleration curves for maturity indices, structural measures, strength tests and batteries, and motor ability elements; to relate various physical and motor growth factors to skeletal age, somatotype components, nutritional status, socio-personal adjustment, interests, and scholastic aptitude and achievement.
Subjects: Boys, seven to 18 years of age.
Methods: (1) Cross-sectional analyses for boys from 9 through 15 years of age; (2) convergence analyses, based on four-year sequences with each fourth year overlapping, for ages seven through 18 years; (3) longitudinal analyses from seven to 18 years; (4) inter-correlational and factor analyses of all traits for the different ages; (5) trace the development of all traits for boys who become athletes, honor roll students, school and other organization leaders, delinquents, and the like.
Duration: September 1956-May 1968.
Investigator(s): H. Harrison Clarke, Ed.D., Research Professor, School of Health, Physical Education and Recreation, University of Oregon, Eugene, Ore.
Cooperating group(s): Athletic Institute (Chicago, Ill.); Medford Public Schools; Curriculum Development Fund, Oregon State Department of Education; and Office of Scientific and Scholarly Affairs, University of Oregon.
Publication: Mimeographed report: "Initial Contributions and Implications of the Medford Boys' Growth Study, 1956 to 1965;" monographs; articles in professional journals.

21-AA-8 PATTERNS OF SOOTHING AND EXCITATION IN NEONATES

Purpose: To investigate the role of excitatory and inhibitory patterns in neonatal development through use of behavioral ratings and heart rate measurements. This research is part of a long-term study of regulatory principles and mechanisms which govern neonatal behavior (see Bulletin 5, Research Relating to Children).
Subjects: Normal, healthy, 2- to 5-day-old full-term babies born at Bronx Municipal Hospital Center.
Methods: Heart rate and behavioral ratings obtained for all experimental sessions. Each neonate tested at three sessions: test, re-test on reactions to a series of soothing stimuli, and one session of trials of excitatory stimuli. Soothing stimuli applied when neonates are aroused are a tone, rocking, sweetened pacifier inserted in babies' mouths, immersion of babies' feet in warm water, and a control period. Each stimulus condition applied three times. Excitatory stimuli applied after feeding when neonates are quiescent are a tone, cold disc applied to the abdomen, and rocking.

Findings: Data analyzed with respect to (1) relationship between heart rate and behavioral ratings; (2) individual differences in overall soothability and in most effective soothing stimuli; (3) test-re-test reliability on successive days; and (4) relationship between excitatory and inhibitory patterns.
Duration: January 1962-continuing.
Investigator(s): Sibylle Escalona, Ph.D., Professor of Psychology; Wagner H. Bridger, M.D., Assistant Professor of Psychiatry; Beverly M. Birns, Ph.D., and Marion Blank, Ph.D., Instructors in Psychology, Department of Psychiatry, Albert Einstein College of Medicine, Yeshiva University, New York, N. Y. 10061.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

21-AA-9 INSTITUTE FOR CHILD STUDY OF PHILADELPHIA

Purpose: To develop standards and norms of physical growth, specific for children of urban Philadelphia. Longitudinal study based on annual or semi-annual follow-up of more than 2,000 children registered at the Institute.
Methods: School Series: initially based on 600 school children in five schools (now 22 schools), ages 6 to 12, "normal" medically and dentally; data collected on national and ethnic background, socio-economic status of parents, medical and dental health history of child, height and weight of parents and siblings, anthropometric measurements and X-rays. American Negro Series: 150 Negro children with normal occlusion selected for study with a view to establishing tentative standards of facial growth. Pilot Study Series: extensive study of 75 children, 6 to 8 years of age, seen every three months for measurements, X-rays, dietetic histories, careful medical examination data, blood chemistry, oral pathology data, etc. Orthodontic Series: all children accepted by Orthodontic Clinic had lateral and postero-anterior head films taken and detailed measurements of head and face made. Orthodontic Treatment Series: a small pilot study of 15 white boys, ages 11 to 15, with a certain type of malocclusion accompanied by V-shaped, high-vaulted palate; 15 with identical orthodontic condition; 15 with normal occlusion--first group to receive free orthodontic care, second and third groups to receive free dental care but no orthodontic treatment. Cleft Palate Series: growth pattern of 250 children with cleft lip and/or palate. Cooley's Anemia Series: family-line investigation of 25 children for traits other than the disease such as faciodental growth dysplasia. Endocrine Series: evaluation of degree of growth deviation with follow-up to study effect of endocrine therapy upon growth pattern. Behavioral Series: 110 first, second, and third graders rated in terms of physical growth progress and simultaneously in terms of grades, emotional stability, and other aspects of classroom behavior to see if there is any real correlation.
Duration: 1947-1967.
Investigator(s): Wilton M. Krogman, Director, Philadelphia Center for Research in Child Growth; and F. E. Johnston, Ph.D., Assistant Professor of Anthropology, University of Pennsylvania, Philadelphia, Pa.
Cooperating group(s): Institute for Child Study of Philadelphia (sponsored by Graduate School of Medicine and Evans Institute of Dentistry of University of Pennsylvania and Children's Hospital of Philadelphia); Philadelphia Department of Public Health; Philadelphia Board of Public Education; Public Health Service, U. S. Department of Health, Education, and Welfare.

21-AA-10 GROWTH RESEARCH UNIT

Purpose: To gain insight into critical factors influencing growth patterns *of all* children by observing the growth and development of deviates, especially those with pathological diagnoses which have been medically documented.
Subjects: Children with congenital cardiac lesions, and children and adolescents with significant deviations of physical, neurological, and behavioral development.
Methods: Inspection, anthropometry, photography, X-ray of the left hand and wrist. Analysis of these basic data for current status and for growth trends.
Duration: 1929-1969.
Investigator(s): Leona M. Bayer, M.D., Co-chairman, Youth Clinic, Presbyterian Medical Center, San Francisco, and Adjunct Clinical Associate Professor of Medicine, Stanford University, Palo Alto, Calif.
Cooperating group(s): Institute of Medical Sciences; Service for Developmentally Handicapped Children.
Publication: *Journal of Clinical Endocrinology and Metabolism* 22:1127-1129, November 1962; *Journal of Pediatrics* 62:5:631-645, May 1963.

21-AA-11 LONGITUDINAL STUDY OF DENTOFACIAL, SKELETAL, PHYSICAL GROWTH AND NUTRITION OF CHILDREN

Purpose: To study the dentofacial growth of children, standards of nutrition, caries increment as related to nutrition, assessment and skeletal age as related to facial growth, variations in physique and its effect on dentofacial growth. Twins are also being studied to determine heritable traits.
Subjects: 400 children, including 40 pairs of twins, ages 3 to 18 years, who have been observed for periods of 3 to 10 years.
Methods: Cephalograms, hand, wrist, and calf X-rays, intra-oral X-rays, study casts, anthropometric measurements, photographs, oral examination, and one-week food diary. Children are examined every six months until 14 years of age.
Initiation date: 1950.
Investigator(s): Bhim S. Savara, D.M.D., M.S., Professor and Head, Child Study Clinic, University of Oregon Dental School, 611 S.W. Campus Dr., Portland, Ore. 97201.
Cooperating group(s): University of Oregon Dental School; Oregon State Board of Dental Examiners; Tektronix Foundation, Inc.; Medical Research Foundation of Oregon; National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: *Radiology*, April 1961; July 1962. *Journal of Dental Research*, July-August 1961; July-August 1962. *Human Biology*, February and September 1962.

21-AA-12 RADIOGRAPHIC ATLASES OF SKELETAL DEVELOPMENT

Purpose: To develop radiographic standards of skeletal development for use as reference standards for children.
Subjects: 4,483 Cleveland children; 134 Boston children; and a sample of Detroit children.
Methods: Series of films of hand, elbow, shoulder, hip, knee, and foot of healthy children are used to identify the modal (moderate) rate of bone development. Revisions or initial standards are prepared as needed to provide standards of reference.

Duration: 1948-1966.
Investigator(s): S. Idell Pyle, Ph.D., Research Associate, Department of Anatomy, Western Reserve University, Cleveland, Ohio; and William Walter Greulich, Ph.D., National Institute of Child Health and Human Development, Bethesda, Md. 20014.
Cooperating group(s): Bolton Study (Cleveland); Department of Maternal and Child Health, Harvard University School of Public Health.
Publication: Current standards: Radiographic Atlas of Skeletal Development of Elbow and Shoulder; Radiographic Atlas of Skeletal Development of Hip. The latest standard for the hand was published in 1959; foot in 1962; and knee in 1955.

21-AA-13 COLLABORATIVE STUDIES IN CEREBRAL PALSY AND OTHER NEUROLOGICAL AND SENSORY DISORDERS OF INFANCY AND CHILDHOOD

Purpose: To investigate factors and conditions affecting parents: (1) conditions of pregnancy itself, such as infections, trauma, bleeding, drugs, and progress of labor; (2) environmental factors influencing mother, such as social and economic conditions, emotional stress, and medical care; (3) biological factors in parents such as age, parity, medical and reproductive history, and immunologic characteristics; (4) genetic background of parents. To investigate in the offspring: disorders of the nervous system of all products of conception at time of delivery or appearing during infancy or early childhood, including cerebral palsy, mental subnormality, behavioral disorders, etc. A detailed investigation of the independent variables will be directed toward the re-evaluation of the effect of factors already suspected, the elucidation of the mechanism through which these factors are operative, and the discovery of factors neither presently known nor suspected.
Subjects: Approximately 8,000 live births per year from 15 collaborating institutions for five years. Offspring followed until school age.
Methods: Analysis of pooled information collected in a uniform way in a number of medical centers throughout the country from women studied during pregnancy and from their offspring followed throughout infancy and early childhood. Intensive study of limited number of cases; less intensive study of as many damaged children and abnormal pregnancies as possible.
Initiation date: 1956.
Investigator(s): Richard L. Masland, M.D., Coordinator of Project, National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare, Washington, D. C. Collaborating institutions: Children's Hospital, San Francisco, Calif.; Yale University School of Medicine, New Haven, Conn.; Charity Hospital, New Orleans, La.; Johns Hopkins University School of Medicine, Baltimore, Md.; Boston Lying-In Hospital and Children's Medical Center, Boston, Mass.; University of Minnesota Medical School, Minneapolis, Minn.; Columbia-Presbyterian Medical Center and New York Medical College, New York, N. Y.; University of Buffalo, Buffalo, N. Y.; University of Oregon Medical School, Portland, Ore.; Children's Hospital of Philadelphia and Pennsylvania Hospital, Philadelphia, Pa.; Brown University, Providence, R. I.; University of Tennessee Medical School, Memphis, Tenn.; Medical College of Virginia, Richmond, Va.
Publication: Johns Hopkins Magazine, June 1959; Summary of Progress in Collaborative Perinatal Research (A Nationwide Mother-Child Study), Public Health Service Research Profile No. 9, PHSP No. 1161, 1964.

21-AA-14 **METHODS IN CHARACTER DEVELOPMENT**

Purpose: To develop more effective methods in character development in cooperation with character training agencies.
Subjects: Children and families in about 30 participating church schools and other groups widely spread in the United States.
Methods: Experimental use of curriculum by participants. Reports of experimental efforts analyzed and curriculum revised on basis of findings. Methods of character education then developed and reported. Emphasis is on character growth in children.
Findings: Anticipate development of instructions for writing character building curricula. These will include types of homes, children, and classes for character development and descriptions of age-level potentials for children.
Initiation date: 1936.
Investigator(s): Ernest M. Ligon, Ph.D., Director, Character Research Project, Union College and University, Schenectady, N. Y.
Cooperating group(s): Lilly Endowment, Inc.
Publication: Published in Union College Studies in Character Research. Also Dimensions of Character, Macmillan, 1956.

GROWTH AND DEVELOPMENT

General

21-BA-1 PERINATAL STRESS AND PREMATURITY

Purpose: To compare subsequent psychological, neurological, and adaptive development through the first six years of life with documented biochemical alterations obtained during first week of life on two groups of prematurely born infants.
Subjects: Approximately 200 prematures born at University of Arkansas Medical Center during the past six years and studied in the premature nursery.
Methods: Subjects were divided into two groups, one fed beginning at six hours of age, and the other withheld from all feedings until 72 hours of age. Biochemical data were obtained on the infants during the first 72 hours of life (see reference below). Follow-up evaluations include a pediatric, psychological, speech and hearing, and neurological examination, including an electroencephalogram. These are done as close as possible to the second, third, fourth, and sixth years of age, respectively.
Duration: February 1966-January 1970.
Investigator(s): John H. Bornhofen, M.D., Assistant Professor of Pediatrics, University of Arkansas Medical Center, Little Rock, Ark. 72201.
Cooperating group(s): Arkansas Children's Hearing and Speech Center, Arkansas State Department of Health; National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Journal of Pediatrics 63:3:361-385, September 1963.

21-BA-2 STUDIES ON VISION AND LEARNING IN THE NEWBORN

Purpose: Two lines of work have been followed: to investigate visual fixation; to show how sucking varies with the nature of the stimulus put in the child's mouth and with the feeding experience the child has had.
Subjects: About 120 newborn, term babies.
Methods: A variety of methods are being used, including a pressure transducer to show both suction (negative pressure) and expression. Measures are also made of heart rate and activity. Changes in these measures are examined for the first four days of life in breast-fed and bottle-fed babies, in nutritive and non-nutritive sucking, and, most recently, when the sucking signals are used to trigger a pump which delivers milk to the child.
Findings: Breast-fed babies suck more slowly than bottle-fed babies; the nature of the stimulus put in the mouth controls the sucking rate; and the characteristics of nutritive and non-nutritive feeding are different.
Duration: 1965-1968.
Investigator(s): Dugal Campbell, Ph.D., Associate Professor, and Judith Allan, M.A., Research Assistant, Department of Psychology, Queen's University, Kingston, Ontario, Canada.
Cooperating group(s): Department of Paediatrics, Queen's University, Kingston, Ontario; Association for Aid to Crippled Children; Ontario Mental Health Foundation.
Publication: Published in Ph.D. thesis form.

21-BA-3 **AN INVESTIGATION OF THE PERCEPTUAL-MOTOR AND AFFECTIVE SEQUELAE OF PERINATAL ANOXIA AS VIEWED WITHIN THE CONTEXT OF PIAGET'S DEVELOPMENTAL PSYCHOLOGY**

Purpose: To test hypothesis that a child possessed of less than normally efficient sensory and motor systems, as presumably would be the case for an anoxic infant, will arrive at a deviant construction of reality. This would be correlated with aberrant affective relationships, particularly within the context of the early mother-child interaction. Hypothesis follows Piaget's contention that reality is constructed out of child's actions vis-à-vis his environment and his perceptions of the consequences of such action.
Subjects: 10 anoxic and 10 non-anoxic full-term infants who have not been mechanically traumatized. Groups are composed of five male and five female subjects.
Methods: Child's interaction with his environment is explored within context of the genesis of visually directed prehension. All infants are tested at one month of age and at monthly intervals thereafter through seven months. At each testing session infant is placed in supine position, and a red plastic ring is suspended above his head. Infant's manner of approach to the ring is recorded on film and subsequently analyzed in terms of Piaget's description of the sensory motor period of development. Following the red ring test, the infant's reactions to such interpersonal situations as the disappearance of the examiner's versus the mother's face, the experimenter's versus the mother's smile, and the experimenter's versus the mother's vocalizations are noted.
Duration: June 1966-February 1967.
Investigator(s): Donald S. Leventhal, Ph.D., Associate in Medical Psychology, Duke University Medical Center, Durham, N. C. 27706.
Cooperating group(s): Council on Research and the Educational Improvement Program, Duke University; Ford Foundation.

21-BA-4 SOME SEX DIFFERENCES IN THE BEHAVIOR OF NEWBORN INFANTS

Purpose: To determine behavior differences with regard to method of feeding and sex.
Subjects: Breast-fed and bottle-fed boys and girls.
Methods: Infants are compared with regard to differences in reflex activity, hand-face contacting, and capacity for maintaining a given level of alertness or sleep before and after feeding.
Findings: Preliminary sample showed that behavior differs with regard to method of feeding and also with regard to sex. Boys seem to be more vigorous in terms of hand-face contact, but girls are more successful in contacting the snout area with the hand and apparently can maintain the state of alert attentiveness for longer periods of time in first four days of life.
Duration: June 1964-September 1966.
Investigator(s): Justin D. Call, M.D., Department of Psychiatry; and Tom Trott; Catherine Wechsler; and Ross Frank, Medical Students, University of California Medical Center, Los Angeles, Calif. 90024.
Publication: Preliminary report, UCLA Medical Faculty Society, February 1965.

21-BA-5 CHILDHOOD HEALTH, ACADEMIC AND SOCIAL CHARACTERISTICS AS INDICATORS OF FITNESS FOR MILITARY SERVICE

Purpose: Inasmuch as one in three young men examined by Selective Service is currently being rejected for physical, psychological, or mental (trainability) reasons, the study aims to find good predictors of a poor future health status, including successful adult functioning, from childhood evidence, and to suggest from these findings areas in the school health program to which more (or less) attention might be devoted.
Subjects: Representative group of about 5,000 boys drawn from eighth and ninth graders in the public schools of New York City during the period 1953-56.
Methods: A random sampling of 17 schools terminating in grade eight or nine was taken (with three strata, using ethnic proportions to define them) and entire registers of boys over a three-year period centering about 1954-55 (grade eight or nine) copied. Cumulative record folders were then traced to the senior high schools. A team of abstractors using a printed form abstracted all relevant information on academic, psychological, and health characteristics noted in records prior to grade 10. Names of these boys were submitted to the New York City Selective Service System to obtain their draft classification status. Data were coded, punched on IBM cards, and tables produced by computer.
Duration: July 1965-June 1967.
Investigator(s): Paul M. Densen, Sc.D., Deputy Commissioner, New York City Health Department; and Doris B. Ullman, M.S., Medical and Health Research Association of New York City, Inc., 125 Worth St., New York, N. Y. 10013.
Cooperating group(s): New York City Board of Education; New York City Selective Service System headquarters; Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: A final report will be submitted to the Public Health Service in June 1967. Portions will probably be published in the *Journal of the American Public Health Association* within the next year.

21-BA-6 ADOLESCENT IMMATURITIES

Purpose: To integrate the developmental tempo in the physical, mental, emotional, sexual, and social components of the total being towards effective maturation.
Subjects: Adolescent clinic patients.
Methods: Longitudinal studies are being made in each of these developmental phases of maturation in order to determine the individual deviations and evolve a clinical method for controlling maturities in all aspects of life at the same relative level to achieve optimal development for optimal functioning for optimal maturation.
Duration: 1950-1968.
Investigator(s): I. Newton Kugelmass, M.D., Ph.D., Consultant, Departments of Health and Hospitals, 1060 Park Ave., New York, N. Y. 10028.
Cooperating group(s): Adolescent clinics in New York City and suburban institutions.
Publication: *Complete Child Care in Body and Mind*. New York: Twayne Publishers, Inc.; *Biochemistry of Blood in Health and Disease*. Springfield, Ill.: Charles C. Thomas; others.

Physical

21-CA-1 A SEARCH FOR LATERAL DOMINANCE IN THE NEWBORN

Purpose: To determine if there is evidence of lateral dominance in the newborn that may be one indication of a degree of central nervous system maturation that would be an important variable to evaluate in observing and interpreting the infant's early experiences with the external environment.
Subjects: Infants in a newborn nursery.
Methods: Infants are examined for direction of lateral head rotation, relative frequency of hand-mouth (snout-peri-snout) contact, and intensity of rooting reflex.
Findings: Right lateral rotation and hand-face contact appear to be predominant, with no appreciable differences between the two sexes.
Duration: September 1965-indefinite.
Investigator(s): Coy E. Swanson, M.D., Chief, Children's Service, Sacramento County Hospital Mental Health Services, Sacramento; and Justin D. Call, M.D., Department of Psychiatry, University of California Medical Center, Los Angeles, Calif. 90024.
Publication: Data and results available from either investigator.

21-CA-2 ON THE DEVELOPMENT OF HUNGER AS A SPECIFIC STATE IN THE NEWBORN INFANT

Purpose: To determine whether or not certain behaviors vary in accordance with the infant's having been fed or not or in accordance with the infant's level of sleep or attentiveness.
Subjects: Newborn infants.
Methods: Rooting reflex, hand-mouth reflex, and sucking response, together with hand-face contacting and state changes, are being studied.
Findings: Preliminary data suggest that feeding does influence these behaviors significantly and independently of the state changes.
Duration: Not reported.
Investigator(s): Justin D. Call, M.D., Department of Psychiatry; and Tom Trott; Catherine Wechsler; and Ross Frank, Medical Students, University of California Medical Center, Los Angeles, Calif. 90024.

21-CC-1 DO-IT-YOURSELF VISION SCREENING PROJECT AMONG THREE-AND-ONE-HALF-YEAR-OLD CHILDREN

Purpose: To determine if parents can accurately screen their own three-and-one-half-year-old children at home when provided with a simple screening device, and to determine if a sufficient number of mothers are willing to carry out the screening to justify such a do-it-yourself program on a continuing basis.
Subjects: 1,000 parents of three-and-one-half-year-old children based on birth certificate information.
Methods: A screening kit was developed which is sent with instructions for the screening and a questionnaire to determine if parents had any difficulty, what the results were, and how they felt about being given the opportunity to screen their own child. Of the 1,000 children 300 will be re-checked by a trained nurse to learn how many apparent vision problems

were missed by the parents who indicated their child had no vision problem. The nurses' findings will have to be confirmed by a professional eye examination.
Findings: The instructions had to be revised and simplified. The average returns among three-and-one-half-year-olds has averaged 57 percent with the help of telephone calls to those not returning the results after four weeks. Parents generally feel three-and-one-half is too young. Consequently, the same material was mailed to parents of children between four and four-and-one-half, which resulted in a 51 percent response in 30 days without any phone calls. The number of vision problems identified during the first three months is too small for evaluation.
Duration: July 1966-June 1968.
Investigator(s): John A. Bacharach, M.P.H., Director, Eau Claire City County Health Department, 414 E. Grand Ave., Eau Claire, Wis. 43701.
Cooperating group(s): Local Lions Club; Public Health Service, U. S. Department of Health, Education, and Welfare.

21-CC-2 A STUDY OF EVOKED POTENTIALS TO AUDITORY STIMULI IN HANDICAPPED CHILDREN

Purpose: To study specific characteristics of evoked potentials to auditory stimuli in normal children, and to apply this information in determining auditory thresholds of deaf, hard of hearing, blind, mentally retarded, and brain-damaged children; also, to concurrently study the function of the auditory nervous system in an effort to contribute information on auditory theory and pathology.
Subjects: Normal and handicapped children, ages six months to six years.
Methods: Electrodes attached to the scalp pick up evoked electrical potentials to auditory stimuli. Potentials are amplified and then extricated from random brain noise through use of a summing computer. Thus, the "average response" can be plotted in the absence of unrelated "brain noise."
Findings: Procedure is reasonably successful with normal hearing subjects.
Duration: January 1966-December 1968.
Investigator(s): Paul Skinner, Ph.D., Associate Professor, Speech Department, University of Arizona, Tucson, Ariz. 85721.
Cooperating group(s): Easter Seal Research Foundation; Tektronix Research Foundation; National Science Foundation.

21-CC-3 EVOKED AUDITORY RESPONSES IN CHILDREN

Purpose: To assess the use of a summing computer as a method of objectively measuring auditory sensitivity in children and in others who are unwilling and unable to give voluntary responses.
Subjects: 105 children, ages 3 days to 11 years; 128 adults.
Methods: Evoked response measures from the intact scalp were fed into a summing computer. The stimuli were bursts of tones fed into the ear by earphones. The ongoing activity of the plan was averaged out, and the average evoked response was recorded. Stimulus intensity was lowered until no responses could be seen, representing the evoked response threshold to auditory stimulus.
Findings: Evoked response measures are easily obtained in older children and in adults. They tend to be most obscure in children below age two, but can be elicited in approximately 80 percent of the cases. This technique is an important adjunct to conventional audiometric techniques.
Duration: January 1965-July 1966. (Formal termination, but project will continue for at least four years).

Investigator(s): Geary A. McCandless, Ph.D., Assistant Professor and Head, Section of Audiology and Speech Pathology, University of Colorado School of Medicine, Medical Center, 4200 E. Ninth Ave., Denver, Colo. 80220.
Cooperating group(s): National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Journal of Speech and Hearing Research, in press.

21-CC-4 BODY IMAGE IN PERCEPTUALLY HANDICAPPED CHILDREN

Purpose: To study changes, if any, in body image of perceptually handicapped children who have undergone perceptual re-training.
Subjects: 50 children, ages 5 to 11, who have been found deficient in visual and auditory perceptual functioning.
Methods: Each child will be tested for perceptual deficits by Frostig and Illinois Test for Psycholinguistic Abilities. DAP and Rorschach will also be administered. Perceptual ages will be scored. Barrier scores by the method of Fisher and Cleveland will be obtained from Rorschach records. DAP will be scored for changes.
Findings: In a pilot study, children with perceptual handicaps showed deviations in their barrier scores prior to re-training. Re-testing is now in progress.
Duration: Fall 1965-Fall 1966.
Investigator(s): Irvin A. Kraft, M.D., Associate Professor of Psychiatry and Pediatrics, Baylor University College of Medicine, and Medical Director, Texas Institute of Child Psychiatry, Houston, Tex. 77025.

21-CC-5 A STUDY OF THE INCIDENCE OF VISUAL PERCEPTUAL DISORDERS IN HIGH-ACHIEVING CHILDREN

Purpose: To study the incidence of visual perceptual disorders in high-achieving children.
Subjects: 70 children in a private school in the high first and middle second grades, who are rated as high-achieving readers.
Methods: Each child in the first and second grades is rated by the head of the lower school as to his achievement level in reading. Subjects are tested with the Marianne Frostig Test for Visual Perceptual Development (1963 standardization) and their perceptual ages are derived. These scores are then compared with early classroom adjustment and achievement level.
Findings: Even in some high-achieving children there appear to be certain areas of perceptual development which are not consistent with the child's earliest educational feats. Some children were discovered who displayed deficits in perception while still achieving above their age level. These results lead to the possibility that some children have learned to compensate for visual perceptual deficits, and have overcome what is normally an educational "handicap."
Duration: December 1965-June 1966.
Investigator(s): Irvin A. Kraft, M.D., Associate Professor of Psychiatry and Pediatrics, Baylor University College of Medicine, and Medical Director, Texas Institute of Child Psychiatry; John Crow, M.D. Candidate, Baylor University College of Medicine; and Lois Buck, B.A., Graduate Student in Special Education, University of Houston, Houston, Tex. 77025.

21-CC-6 ASSESSMENT OF VISUAL PERCEPTUAL LIMITATIONS IN YOUNG CHILDREN

Purpose: To test hypothesis that children deficient in their visual perception of forms have atypical exploratory movements of the eyes during observation of forms.
Methods: Visual perceptual test items involving forms will be graded in complexity. This will involve developing items that vary in figure, and ground, line, and form complexity. Child's eye movements will be recorded while child is observing these materials. Attempts will be made to identify the pattern of eye movements that accompany accurate versus inaccurate observation of the sets of perceptual materials presented. Data will also be analyzed to test if certain eye movements are necessary for perception of forms at different levels of complexity.
Duration: 1966-1969.
Investigator(s): Peter F. Briggs, Ph.D., Department of Physical Medicine and Rehabilitation, University of Minnesota Medical Center, Minneapolis, Minn. 55455. (Reported by Frederic J. Kottke, M.D., Professor and Head, Department of Physical Medicine and Rehabilitation, University of Minnesota Medical Center.)

21-CC-7 A STUDY OF VISUAL PERCEPTIONS AS RELATED TO CULTURAL DEPRIVATION

Purpose: To investigate the role of perceptions in pre-school children as related to cultural deprivation; to try to determine the type of program most effective for remedying perceptual difficulties.
Subjects: Three-, four-, and five-year-old children in regular nursery school, and children of the same age who are in the program for the disadvantaged, the latter group consisting of children from different cultures, including the Indian (Zuni, Navajo, and Laguna).
Methods: The Frostig Visual Perception Test is administered in small groups to the disadvantaged and to those in the regular nursery.
Findings: The perceptions of the child in the program for the disadvantaged differ from those of the child in the regular nursery school.
Duration: January 1967-1970.
Investigator(s): Dr. David Dennis, Director of Research, and Adelaide Glaser, Head, Department of Home Economics, and Director, Child Development Center, Western New Mexico University, Silver City, N. M. 88061.

21-CC-8 LATERALITY OF SENSORY AND MOTOR FUNCTIONS IN MAN

Purpose: To investigate several aspects of laterality in man; to determine the mechanism(s) subserving lateral organization; and to integrate these findings toward a theory of laterality that might be applicable to developmental problems in children. Particular emphasis will be addressed to the determinants of handedness and its relationship to speech-brain laterality.
Subjects: Normals, both children and adults, without evidence of brain pathology; also identical twins.
Methods: Test procedures involve application of new techniques of simultaneous stimulation in vision, audition, and somesthesis. Disparate messages are presented in pairs simultaneously at very rapid rates in each modality. Response variables are based upon recall or recognition of these messages. Visual experiments involve both monocular and visual field stimulation in which crossed and uncrossed pathways are put into competition. Manual laterality is determined by application of performance tests and analyzed by multivariate analysis.

Duration: February 1966-January 1969.
Investigator(s): Paul Satz, Ph.D., Assistant Professor, Department of Clinical Psychology, University of Florida, Gainesville, Fla. 32601.
Cooperating group(s): Florida Council for Research and Training in Mental Health; Center for Neurobiological Sciences, and Department of Neurosurgery, University of Florida; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Journal of Neurology, Neurosurgery and Psychiatry, and Neuropsychologia, in press.

21-CC-9 LANGUAGE AND HEARING OF EIGHT-YEAR-OLD CHILDREN

Purpose: To develop an instrument to measure speech, language, and hearing in eight-year-old children; to compare eight-year-old performance with three-year-old performance measures obtained on the same children; to compare eight-year-old measures of speech, language, and hearing with medical history including pregnancy and delivery data, and with periodic medical and psychological examination data.
Subjects: Eight-year-old children previously tested in the areas of speech, language, and hearing at age three.
Methods: A tentative instrument is first evaluated by a panel of consultants. Pre-testing follows. Eventually, findings will be compared at three and eight years.
Duration: 1965-1970.
Investigator(s): Frank M. Lassman, Ph.D., Department of Physical Medicine and Rehabilitation, University of Minnesota Medical Center, Minneapolis, Minn. 55455. (Reported by Frederic J. Kottke, M.D., Professor and Head, Department of Physical Medicine and Rehabilitation, University of Minnesota Medical Center.)

21-CC-10 PRE-READING: IMPROVEMENT OF VISUAL-MOTOR SKILLS

Purpose: To evaluate the use of an arbitrarily determined sequence of learning activities for improving visual-motor skills of kindergarten subjects.
Subjects: Kindergarten pupils with I.Q. of 80 to 120, C.A. of 60 to 74 months, no evidence of hearing impairments or visual inefficiencies according to school records, ability to discriminate primary colors, freedom from gross organicity, and ability to speak English fluently.
Methods: Subjects were divided into a control group of 27 and an experimental group of 28 and given the Visual-Motor Test and the Betts Word-Form Test. The control group received the regular kindergarten program, while the experimental group received the regular kindergarten program plus differentiated teaching of visual-motor skills. Post-testing included the re-administration of the Visual-Motor Test and the Betts Word-Form Test. Performance of both groups was statistically evaluated by an analysis of covariance in which adjustment was made for initial differences in Visual-Motor Test I, Betts Word-Form Test I, and mental age.
Findings: The ability of kindergarten pupils to reproduce selected geometric figures is amenable to training; word discrimination ability, in turn, is improved by training in the reproduction of selected geometric figures.
Duration: 1967.
Investigator(s): Mary H. Bosworth, Ed.D. Candidate, Reading Research Laboratory, School of Education, University of Miami, Coral Gables, Fla. 33124. (Reported by Emmett A. Betts, Ph.D., Research Professor, School of Education, University of Miami.)
Publication: To be published by Winter Haven Lions Research Foundation, 1967.

BEST COPY AVAILABLE

21-CC-11 ANALYTIC STUDIES OF VISUAL PERCEPTION

Purpose: To investigate (1) the magnitude of the Poggendorff illusion as a function of age; (2) the effect of stimulus distance and age on shape matching; (3) monocular and binocular size matching as a function of distance at various age levels; and (4) the relation between age and the magnitude of the Ponzo illusion.
Subjects: Children and adults, ranging in age from 5 to 88, some of normal intelligence and others mentally defective but with normal vision.
Findings: (1) The magnitude of the Poggendorff illusion decreases with age from 5 to approximately 10 years, after which it remains stable into old age, and the illusion is greater among feeble-minded observers independent of chronological age; (2) at three feet, shape constancy was inversely related to age, while at 15 feet, constancy was minimal at all ages; (3) loss of binocular cues is critical only under conditions where size constancy is incomplete or marginal; and (4) the Ponzo illusion increases rapidly up to about age 13, after which it remains stable through age 50, and, for older subjects tested, the magnitude of the illusion decreased markedly.
Duration: 1963-1969.
Investigator(s): Herschel W. Leibowitz, Ph.D., Professor of Psychology, The Pennsylvania State University, University Park, Pa. 16802.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Child Development and American Journal of Psychology, in press, 1967; Journal of Experimental Psychology, June 1967.

21-CC-12 VISUAL-MOTOR SKILLS: RESPONSE CHARACTERISTICS AND PRE-READING BEHAVIOR

Purpose: To study assumed facets of visual-motor skills and the relationship between achievement in these skills and a measure of visual-perception reading readiness.
Subjects: 58 kindergarten pupils of normal intelligence.
Methods: A test of finger agnosia, the Lorge-Thorndike Intelligence Test, Level 1, Form A, and the Word-Form Test of the Betts Ready-to-Read Tests, V-2, were administered individually, with considerations for test interaction and practice effects, and data were analyzed.
Findings: The relationship between kindergarten subjects' concepts of geometric forms and their ability to copy them was not significant; the subjects' scores for copying geometric forms ranged from no response distortions to inability to reproduce the form. Their highest achievement was with the vertical cross and the lowest, with the divided rectangle; additional findings.
Duration: 1967.
Investigator(s): Katherine DiMeo, Ph.D. Candidate, Reading Research Laboratory, School of Education, University of Miami, Coral Gables, Fla. 33124. (Reported by Emmett A. Betts, Ph.D., Research Professor, School of Education, University of Miami.)
Publication: To be published by Winter Haven Lions Research Foundation, 1967.

21-CC-13 RELATIONSHIP BETWEEN INTELLIGENCE AND THE VISUAL EVOKED RESPONSE

Purpose: To evaluate the relationship between intelligence and cortical responses evoked by visual stimuli; to see how this relationship varies as a function of sex and stimulus intensity.

Subjects: Two experimental groups of 10- to 11-year-old children matched for sex: an intellectually superior group (I.Q.'s of 125 to 140 on WISC scale), and an intellectually retarded group (I.Q.'s of 60 to 75 on WISC scale), all without known organic deterioration.
Methods: Children are evaluated neurologically and psychologically. "Averaged" evoked response to a stimulus, a precise measure of cerebral electrical activity, is taken. Electrical changes at the cortex and other areas of the brain initiated by a stimulus such as a pulse of light, a shock, or a click are minute and in most cases are lost in the background activity of the EEG tracings. New electronic computers enable researchers to sum these minute responses so that they emerge from the background "noise" of the brain as an identifiable pattern.
Duration: 1966-1967.
Investigator(s): Lee Rhodes (Ph.D. Candidate), Clinical Psychology Trainee; Edward C. Beck, Ph.D., Director, Neuropsychology Laboratory; and Robert E. Dustman, Ph.D., Research Associate, Veterans Administration Hospital, Salt Lake City, Utah 84113.
Publication: Final report planned.

21-CC-14 VISUAL AND SOMATOSENSORY EVOKED RESPONSES OF MONGOLOID AND NORMAL CHILDREN

Purpose: To compare the evoked potentials of mongoloid, undifferentiated mental defective, and normal children, for consistent differences in wave form, latency, and amplitude, and to study their somatosensory and visual responses.
Subjects: 25 mongoloid younsters, ages 9 to 15; 15 undifferentiated mentally deficient youngsters, ages 10 to 16; and a control group of 15 normal youngsters. Both experimental groups were selected from a day school program for mentally handicapped children; the control group was selected from the public schools.
Methods: Each subject is seated in a padded chair in a darkened room as free from extraneous stimuli as possible. Scalp electrodes are attached and ear-ground reference leads used. The electrical brain activity of the subjects is amplified, recorded, and stored on a tape recorder. The flash evoked responses from the four brain areas are averaged by computer and plotted graphically for quantification and statistical evaluation. The plotted evoked responses are measured and analyzed to determine if the groups can be differentiated on the basis of Visual Evoked Responses (EVP) wave latencies and amplitudes or EVP configuration.
Investigator(s): Hugh B. Bigum (Ph.D. Candidate), Counseling Psychology Trainee; Edward C. Beck, Ph.D., Director, Neuropsychology Laboratory; and Robert E. Dustman, Ph.D., Research Associate, Veterans Administration Hospital, Salt Lake City, Utah 84113.
Publication: Final report planned.

21-CC-15 SENSORY STIMULATION, CONDITIONING, AND AROUSAL IN INFANCY

Purpose: To discover modality differences in conditioned stimuli when conditioning autonomic (e.g., pupillary response to light) and somatic (e.g., eyeblink) responses in infants; to relate current neurological theories to behavioral measures of sensory capabilities and reflexive capacities of infants, and to determine effects of various "states" or arousal on these variables as well as on overt behaviors such as crying.
Subjects: Normal infants, four to eight weeks of age, sampled from residence nurseries and private homes.

Methods: Using as Conditioned Stimulus (CS) sound, time, and time plus sound, and varying in addition the CS-UCS onset-interval, pupillary dilation or constriction is elicited by a light UCS. Infrared film in a 16mm motion picture camera allows continuous recording of the pupillary response. Nine test trials (absence of the UCS) randomly intermixed with conditioning trials reveal the presence of the CR. Projected negative images of subject's eye allow measurement which is electronically converted to original pupil diameter. Auditory, visual, temperature, and proprioceptive stimuli in combinations are presented to infants. Various physiological and behavioral measures of arousal level are taken to discover greatest quieting effects.
Findings: Infants condition to time or time plus sound as a CS but not to sound with the pupillary response. Different inter-stimulus intervals have no effect on this finding. Infants with eyeblink response do condition to sound but not to time as the CS.
Duration: February 1966-February 1968.
Investigator(s): Yvonne Brackbill, Ph.D., Professor of Psychology, and Larry M. Lintz, Ph.D. Candidate, U. S. Public Health Service Trainee, Department of Psychology, University of Denver, Denver, Colo. 80210.
Cooperating group(s): National Science Foundation.
Publication: *Journal of Experimental Child Psychology* 4:276-279, 1966; *Perceptual and Motor Skills* and *Psychonomic Science*, in press, 1967.

21-CD-1 EEG SLEEP PATTERNS OF THE TWO-YEAR-OLD

Purpose: To evaluate extent and nature of sleep disturbances in the infant.
Subjects: 16 two-year-old infants.
Methods: Subjects are studied for four consecutive nights using the electroencephalogram and electrooculogram. These records will be scored for four stages of sleep and for the dream stage (1-REM). Data will then be tabulated for each subject to give a picture of individual infant sleep patterns and analyzed across subjects to display patterns typical of the infant two-year-old.
Duration: Not reported-June 1967.
Investigator(s): R. Dean Coddington, M.D., Associate Professor of Psychiatry, and William C. Kohler, M.D. Candidate, J. Hillis Miller Health Center, University of Florida, Gainesville, Fla. 32601.

21-CG-1 AN INVESTIGATION OF MOTOR SKILLS IN CHILDREN WITH LANGUAGE DISORDERS

Purpose: To determine specific types of motor problems associated with language disordered children.
Subjects: Language disordered children, ages four to nine, who demonstrate no medically recognized orthopedic problems.
Methods: Administration of extensive language and motor batteries to determine specific language and motor disorders or delayed developmental patterns.
Findings: General findings indicate fairly consistent difficulties in balance, agility, body posture, and ballistic movements in pilot group studies.
Duration: September 1965-January 1968.
Investigator(s): Jean R. Boudreaux, Ph.D., Associate Professor, Speech Department, University of Arizona, Tucson, Ariz. 85721. (Reported by David L. Patrick, Coordinator of Research, University of Arizona.)

21-CH-1 EFFECTS OF REWARD AND PUNISHMENT ON STUTTERING IN CHILDREN

Purpose: To study hesitation behavior in children as a function of verbal reward and punishment. Specifically, to test hypotheses that (1) more hesitation occurs under the condition of punishment than reward, and (2) effects of punishment are greater in younger than older children, and in boys than girls.
Subjects: 160 third and sixth grade children from three schools.
Methods: Subjects were screened for normal articulation, fluency, and hearing, and evaluated for satisfactory emotional adjustment via teacher report and school records. Twenty boys and twenty girls at each grade level were assigned randomly to each of two treatment groups (80 percent reward/20 percent punishment and vice versa). Pre-recorded tri-syllabic nonsense words of English CVCVCV combinations and stress pattern were presented free-field at a comfortable listening level. Reward (good, right, mm-hmm) or punishment (no, wrong, huh-uh) was delivered after each pronunciation by live voice in a factual manner on a pre-determined basis. Subject responses were tape recorded. Graphic level recordings of control and experimental items are being analyzed for latency and utterance duration. Relevant statistical analyses will be performed.
Duration: July 1965-June 1966.
Investigator(s): Paul J. Jensen, Ph.D., Research Assistant Professor, Communication Sciences Laboratory, Department of Speech, University of Florida, Gainesville, Fla. 32601.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

21-CH-2 A STUDY OF VOICING IN THE STOPS FOUND IN THE PRE-LINGUISTIC BABBLINGS OF INFANTS

Purpose: To study the acquisition of the phonological system in the vocalizations of infants with/normal hearing.
Subjects: Three males and three females, ages 10 and 12 months, from American English-speaking families.
Methods: Mother and child were brought to a laboratory, and the mother was instructed to interact verbally with the child in her usual manner. She was cautioned not to talk while the child was vocalizing. One or two 25-minute recording sessions were made for each visit to the laboratory, and tape recordings were analyzed. Wide-band spectrograms were made and Voice Onset Time measurements were taken directly from the spectrograms.
Findings: Something approaching the middle category on the VOT continuum is the first to emerge in infant vocalizations. Also, it appears that a child may learn to produce stops with long voicing lead before he learns to produce stops with long voicing lag.
Duration: Not reported.
Investigator(s): Malcolm S. Preston, Psychologist, Haskins Laboratories, 305 E. 43rd St., New York, N. Y. 10017; and Neurocommunications Laboratory, School of Medicine, Johns Hopkins University, Baltimore, Md. (Reported by Franklin S. Cooper, President, Haskins Laboratories.)
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.

Intellectual

21-DA-1 A STUDY OF SELECTED COGNITIVE AND AFFECTIVE VARIABLES FUNCTIONING IN TWO SUB-GROUPS OF LOWER ECONOMIC CLASS FIFTH AND SIXTH GRADE PUPILS IN A NON-METROPOLITAN AREA

Purpose: To investigate possible differences between upper and lower economic class pupils on variables of intelligence, achievement, school attitudes, self-concept, sociometric status, and teacher preference for student; to investigate possible differences on specified variables between pupils from two sub-groups of the lower economic class.
Subjects: 393 fifth and sixth grade pupils from 20 classrooms in three school districts in southern Illinois.
Methods: Data were gathered from school records, interviews with school personnel, and administration of standardized and non-standardized tests and scales. Data were analyzed by analysis of variance (covariance for the achievement variables) to determine if significant differences existed among the three economic groups when studied as a total population, as a female sub-population, as a male sub-population, as a Caucasian sub-population, and as a Negro sub-population.
Findings: Although differences on the variables were found between sub-groups of the lower economic class, none was significant. Between lower and upper economic class students significant differences were obtained, but only on the intelligence variable was a consistent pattern attained--vocabulary achievement was significant when controlled for intelligence; arithmetic and reading were non-significant.
Duration: February 1965-May 1966.
Investigator(s): Burton Crosswait, Ph.D., Assistant Professor, Southeastern State College, Durant, Okla. 74701.
Publication: Doctoral dissertation available on microfilm from University of Michigan, Ann Arbor, Michigan, or by inter-library loan from Southern Illinois University, Carbondale, Illinois. Publication planned in near future.

21-DA-2 METHOD FOR ASSESSING INFANT ENVIRONMENTAL STIMULATION

Purpose: To establish a methodology for observing and recording environmental stimulation and the behavior of nine- and twelve-month-old infants, and to observe a group of infants of this age for an estimate of sex and sibling order differences within each group. This research will lead to a description of the range and variability of environmental stimulation in the average home, thus permitting later comparisons with homes varying in socio-economic level, number of other children in the home, etc.
Subjects: Nine- and twelve-month-old infants.
Methods: On the basis of observations of nine- and twelve-month-old infants in their own homes, a checklist of caretaker and infant behaviors devised by Rheingold (1960) will be modified. To establish interrater reliability, both principal investigator and research assistant will observe a small group of infants and record caretaking and infant behaviors. Each will then separately collect data on nine- and twelve-month-old infants, each group composed of equal numbers of male, female, first and second born infants.
Duration: Not reported-December 1966.

Investigator(s): Marilyn T. Erickson, Assistant Professor of Psychology, University of North Carolina, Chapel Hill, N. C.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

21-DA-3 ENVIRONMENTAL STIMULATION AND INTELLECTUAL DEVELOPMENT OF MEXICAN-AMERICAN CHILDREN: AN EXPLORATORY PROJECT

Purpose: To identify environmental variables which are related to the development of intellectual and linguistic skills in Mexican-American children.
Subjects: 80 six-year-old Mexican-American children who indicate high and low potential for school success.
Methods: Home environments of these children were investigated through home interviews and observations. A descriptive analysis of the interview protocols provided an outline of recurring patterns of behavior and attitudes among families of the contrasting groups of children, and the kinds of environmental experiences available to these children were delineated. Interview data were also quantified through use of rating scales which were used in judging 33 characteristics of the environments. Environmental data for the two groups were compared for similarities and differences, and the hypothesis of no difference between environments of the two groups was tested.
Duration: February-September 1966.
Investigator(s): Ronald W. Henderson (Ed.D. Candidate), Assistant Professor of Education, University of Oregon, Eugene, Ore. (Reported by David L. Patrick, Ph.D., Coordinator of Research, University of Arizona, Tucson, Ariz. 85721.)
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Final report to Office of Education; publication in periodicals also planned.

21-DA-4 CHILDREN'S ESTIMATES OF RELATIVE FREQUENCIES

Purpose: To discover how children assess certain regularities in the environment and how they utilize information to modify opinions concerning state of the environment.
Subjects: 6- and 11-year-old children.
Methods: Children are investigated with respect to accuracy in making estimates of relative frequencies of events in a situation in which mathematics may not be used. An attempt is made to determine the precise relationship between real and estimated relative frequencies, and certain factors which are thought to distort children's estimates are examined. Also, they are given sample data to test ability to draw inferences concerning population values in an attempt to discover the manner in which children at various ages deal with partial information concerning a larger set of events, ways in which children modify previous opinions on the basis of additional data, and how children's feelings of confidence concerning their judgments are affected by various characteristics of the data.
Duration: June 1966-June 1967.
Investigator(s): Herbert P. Ginsburg, Ph.D., Assistant Professor, Department of Child Development and Family Relationships, New York State College of Home Economics, Cornell University, Ithaca, N. Y. 14850.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

21-DB-1 DEVELOPMENT OF COGNITIVE COMPONENTS IN CHILD DRAWINGS

Purpose: To investigate the relative efficacy of daily practice in drawing familiar forms and copying unfamiliar forms, and of visual stimulation through handling picture books and photographs depicting familiar and unfamiliar objects in increasing the ability to draw representatively.
Subjects: Approximately 120 children between 5 and 16 years of age, living in Peru at an elevation of about 14,000 feet. Children have no schooling, no exposure to pictorial forms, and have very few objects with which to play.
Methods: A program of perceptual and drawing tests has been devised with which to study the development of perceptual processes and object concepts as portrayed in drawings. It is expected that considerable light may be thrown on how rapidly children can learn to translate newly acquired object concepts into pictorial form, and the roles of practice and visual experience in this development.
Duration: Not reported.
Investigator(s): Dale B. Harris, Ph.D., Professor and Head, Department of Psychology, The Pennsylvania State University, University Park, Pa. 16802.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

21-DB-2 DEVELOPMENTAL ASPECTS OF INTELLECTIVE ABILITIES

Purpose: To study growth of abilities of children in elementary and secondary school.
Subjects: Elementary, secondary school, and college age children.
Methods: Development of aptitude battery, and factor analysis of results of 30 tests of cognitive ability.
Findings: There is increasing differentiation and clarification of abilities with age, with a qualitative difference in sex patterns.
Duration: June 1966-June 1969.
Investigator(s): Philip S. Very, Ph.D., Assistant Professor of Psychology, University of Rhode Island, Kingston, R. I. 02881.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Genetic Psychology Monographs, Spring 1967 and later issues.

21-DB-3 ASSESSMENT AND DEVELOPMENT OF COGNITIVE SKILLS IN YOUNG CHILDREN

Purpose: To investigate ways in which key cognitive skills develop in young children and methods for advancing these skills; to develop a set of observational and instructional materials for use in kindergarten and pre-kindergarten classes, and to develop techniques for familiarizing teachers with concepts and procedures used in assessing and fostering intellectual growth; to give assistance to New York City in utilization of these techniques.
Subjects: Approximately 288 New York City school children, ages four to six, including upper-middle class white children and lower class Negro children.
Methods: During individual testing sessions, each child will be tested with tasks specifically designed to measure cognitive development in areas of classification, time concepts, understanding of change, and selected language correlates.
Duration: April 1966-December 1968.

Investigator(s): Richard S. Melton, Ph.D., Research Psychologist, Educational Testing Service, Princeton, N. J. 08540. (Reported by Frances M. Aversa, Research Assistant, Educational Testing Service.)
Cooperating group(s): Carnegie Corporation.
Publication: Educational Testing Service research bulletins and appropriate journals.

21-DB-4 STUDIES OF COGNITIVE, MOTOR, AND MOTIVATIONAL FACTORS IN REHABILITATION OF CHILDREN AND ADULTS

Purpose: To develop test scales that present stimulus materials through selected sensory receptors; to provide estimates of cognitive capacity through the use of learning tasks; to correlate the ease with which children are trained to be independent and dependent in completing tasks with the gross clinical patterns of independence and dependency in the ward and clinic.
Methods: Selection of existing tasks which minimize the complexity of the motor response; "probing" through the use of training, a new approach to formal assessment required most frequently in cases of very low ability or in grossly handicapped children; focusing on the results of training regimes established for each child and noting the rate of acquisition of the responses involving dependency and competence.
Duration: 1965-1968.
Investigator(s): Peter F. Briggs, Ph.D., and Auke Tellegen, Ph.D., Department of Physical Medicine and Rehabilitation, University of Minnesota Medical Center, Minneapolis, Minn. 55455. (Reported by Frederic J. Kottke, M.D., Professor and Head, Department of Physical Medicine and Rehabilitation.)

21-DB-5 STUDY OF EARLY COGNITIVE DEVELOPMENT IN CULTURALLY DISADVANTAGED CHILDREN

Purpose: To study the intellectual and linguistic development of disadvantaged children.
Subjects: Children ages 3 to 12 from culturally deprived and middle class families.
Methods: Experimental procedures are utilized to study the role of language, stimulus complexity, and training procedures in conceptual learning.
Findings: Disadvantaged children are capable, when properly instructed, to solve concept problems as effectively as middle class children. Training in discrimination and induction improves performance, while training in labelling has no effect on concept attainment.
Duration: July 1964-July 1968.
Investigator(s): Leon Eisenberg, M.D., Professor of Child Psychiatry, and Sonia F. Osler, Ph.D., Associate Professor of Medical Psychology and Pediatrics, School of Medicine, Johns Hopkins University, Baltimore, Md. 21205.
Cooperating group(s): Grant Foundation.
Publication: *Child Development*, one article in press, another submitted.

21-DC-1 FLICKER DISCRIMINATION AND GENERALIZATION BY TODDLERS

Purpose: To study generalization behavior in pre-verbal children as a function of prior operant discrimination training; to test assumption that the more a subject learns about the properties of a stimulus dimension, the more his behavior will be controlled by stimuli belonging to that dimension.
Subjects: Children ages 15 to 30 months.
Methods: Degree of acquired familiarity with visual flicker stimuli is manipulated by nature of discrimination training given to three separate groups of subjects: (1) discrimination training between a 15 cps light flash and another flickering stimulus, (2) training between the presence and absence of the 15 cps stimulus, and (3) no explicit discrimination training. The 15 cps light is continuously presented and reinforced, but there is no occasion for this stimulus to be compared against other stimuli. To determine effect of such training, a subsequent task involving presentation of a number of flickering stimuli together with the previously experienced 15 cps stimulus is given to all subjects. Light is occasionally reinforced to keep children continually engaged.
Duration: Not reported-May 1967.
Investigator(s): Paul Weisberg, Assistant Professor of Psychology Brown University, Providence, R. I. 02912.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Article has been submitted to *Journal of the Experimental Analysis of Behavior*.

21-DC-2 THE EFFECT OF TEACHING CHILDREN TO GUIDE THEIR OWN DEVELOPMENT

Purpose: To determine the effect of extending the program of teaching the dynamics of behavior to include applications by the pupil to the guiding of his own development.
Subjects: Fifth grade pupils in Council schools.
Methods: Teaching units dealing with applications of the knowledge of dynamics of behavior previously learned to the pupil's own development and its guidance were prepared and are now being taught. Measurements of pupil learning and growth in ability to learn on his own are being collected. Experimental and control groups are employed.
Duration: January 1966-indefinite.
Investigator(s): Karen Pritchett, Ph.D., Research Associate, Educational Research Council of Greater Cleveland, Rockefeller Bldg., Cleveland, Ohio 44113. (Reported by Ralph H. Ojemann, Ph.D., Director, Child-Educational Psychology and Preventive Psychiatry Division, Educational Research Council of Greater Cleveland.)
Cooperating group(s): The Grant Foundation.

21-DC-3 THE DEVELOPMENT OF CONCEPTS OF THE CONSERVATION OF LENGTH, NUMBER, AMOUNT, AND VOLUME THROUGH USE OF GUIDED LEARNING PROGRAMS

Purpose: To test effects of a guided learning program for teaching young children to conserve length, number, amount, and volume.
Subjects: Random samples of children, ages four to six.
Methods: A guided learning program is being developed which is designed to build on the child's present concepts of conservation and carefully sequenced to include learning tasks that lead toward the conservation of volume. The children will be given pre-, intermediate, and post-tests to assess their growth in the concepts.

Duration: April 1967-indefinite.
Investigator(s): Karen Pritchett, Ph.D., Research Associate, and Ralph H. Ojemann, Ph.D., Director, Child-Educational Psychology and Preventive Psychiatry Division, Educational Research Council of Greater Cleveland, Rockefeller Bldg., Cleveland, Ohio 44113.
Cooperating group(s): The Grant Foundation.

21-DC-4 VERBAL LEARNING IN CHILDREN

Purpose: To study associative behavior and verbal learning in children of different ages with a view to testing notions derived from an interference interpretation of learning.
Subjects: 80 second and 80 fifth grade children from middle and upper-middle class homes.
Methods: Subjects are given standard paired-associate training on seven-item lists consisting of single-letter stimuli and single-letter responses. An attempt is made to equate sub-groups for level of learning prior to testing for retention. Sub-groups vary with respect to associative strength of connection between the stimulus and response terms as measured on both adult and child norms.
Findings: The younger group learned significantly more slowly but retained significantly better than the older group. There was a trend for the highly associated lists to be better retained than the less highly associated lists (not significant). However, in a subsequent study in which level of learning was controlled by an experimental technique for equating the number of reinforcements given to all items, the differences due to grade level disappeared, and the effect of meaningfulness was replicated.
Duration: September 1964-August 1967.
Investigator(s): Geoffrey Keppel, Ph.D., Assistant Professor of Psychology and Assistant Research Psychologist, and Harriett Amster, Ph.D., Associate Research Psychologist, Institute of Human Learning, University of California, Berkeley, Calif.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Psychonomic Monograph Supplements 1:9:211-238, 1966. Other articles planned.

21-DC-5 LEARNING DISABILITIES IN CHILDREN: SIBLING STUDIES

Purpose: To discover whether the characteristics of academically handicapped children can be more precisely identified and described; to further clarify the causes of learning disabilities; and to explore those aspects of learning disabilities that appear to be familial.
Subjects: 304 elementary and junior high school age children: 76 educationally handicapped, with 76 siblings and 140 parents, and 76 academically successful, with 76 siblings and 137 parents.
Methods: Children are given educational, psychological, and medical evaluations. Parents are interviewed and given reading tests. Educationally handicapped children are compared with their same sex siblings and with matched same sex children who are academically successful, and their siblings; and parents of the educationally handicapped children are compared with the parents of the academically successful children on a number of items.
Duration: September 1966-not reported.

Investigator(s): Freya W. Owen, Ph.D., Coordinator, Educationally and Mentally Handicapped Department, Palo Alto Unified School District, 25 Churchill Ave., Palo Alto 94306; Pauline A. Adams, Ph.D., Psychologist, Stanford Convalescent Home, 1020 San Mateo Dr., Menlo Park; and Thomas Forrest, M.D., Pediatric Neurologist, Institute for Childhood Aphasia, School of Medicine, Stanford University, Palo Alto, Calif. 94304.
Publication: Publication planned.

21-DC-6 A MULTI-DIMENSIONAL STUDY OF LEARNING DISORDERS IN CHILDREN WITH NORMAL INTELLIGENCE, WITHOUT GROSS NEUROLOGIC DEFECTS, AND WITHOUT SERIOUS PRIMARY EMOTIONAL DISTURBANCE

Purpose: To determine causes for learning disorders and their interaction.
Methods: The social influences studied are parental attitude, parental interaction, and source of parental anxiety or focus of parental concern. Medical data will include detailed history of birth, development, and serious illness, and careful neurological examination. Psychological assessments will attempt to study every known sensory, perceptional, and motor response system that codes and delivers information for cognitive development. Social-personal behavior is to be rated by psychologists, teachers, and parents and the ratings compared. The test battery now consists of 42 tests, and the data from the tests are being interpreted under a system of blind analysis as psychometric technicians supply the data. If specific problems can be found, management and prescriptive teaching will be employed, the results of which will be determined through active follow-up of the children seen in this program.
Duration: 1967-indefinite.
Investigator(s): J. Philip Ambuel, M.D., Professor of Pediatrics, Ohio State University, and Medical Director, Outpatient Department, Children's Hospital; David Sabatino, Ph.D., Instructor in Psychology, Ohio State University, Columbus 43210; and Curtis Brown, M.S.W., Children's Hospital, Columbus, Ohio 43205.

21-DC-7 A COMPARISON OF VISUAL AND TACTUAL DISCRIMINATION LEARNING OF RETARDED AND SCHIZOPHRENIC CHILDREN

Purpose: To determine the course of learning by schizophrenic children as a function of the sense modality used in obtaining information from the environment.
Subjects: 45 children, educable mentally retarded, educationally retarded with mild emotional or behavioral disturbance, and severely emotionally disturbed. Retarded children were used as a control for mental age.
Methods: Children were assigned randomly to two experimental groups and given the object discrimination problem and the oddity problem. The visual-to-tactual group was given each problem first with visual stimuli followed by presentation of the problem with tactual stimuli. The tactual-to-visual group received the tactual and visual stimuli in reverse order. All of the children received both presentations of the object discrimination problem before the two presentations of the oddity problem. The apparatus used was a modification of the Wisconsin General Test Apparatus.
Findings: Data yielded support for the notion that schizophrenic children make more efficient use of touch than of vision in orienting to their environment since tactual experience provided them with a broader base for transfer than visual experience. The schizophrenic children resembled normal groups in the use they made of information gathered from the environment and in ability to maximize the probability of reward.

Duration: Not reported.
Investigator(s): Suzanne D. Hill, Ph.D., Assistant Professor of Psychology, Louisiana State University in New Orleans, Lakefront, New Orleans, La. 70122; and Lester W. Barnett, Jr., Auburn University, Auburn, Ala. 36830.
Publication: Submitted to *Journal of Experimental Child Psychology*.

21-DC-8 RELATIONSHIP BETWEEN LEARNING CONCEPTS AND STUDENT ACHIEVEMENT

Purpose: To investigate developmental aspects of conceptual behavior in a rigorously controlled laboratory situation, and to investigate the relationship of concept learning in this laboratory situation to achievement in curricular areas of the junior high school.
Subjects: 120 students, 20 males and 20 females each from grades seven, eight, and nine.
Methods: Figural-dimensionalized stimulus material is used in two types of experiments. In the first type, responses to problems are analyzed to determine the effects of grade level, sex, and exemplars and non-exemplars of concepts on information processing and concept attainment. Responses to additional problems are analyzed to determine effect of the same variables upon concept attainment tasks *in toto*. Second type of experiment consists of a factor analysis of sub-scores from first type of experiment, time-to-criterion scores from total concept attainment problems, and sub-scores from four tests of curricular achievement: numerical, verbal, social studies, and science. Alpha factor analysis and incomplete image analysis are used for data reduction. Normal varimax and oblique rotation procedures are used to achieve both orthogonal and oblique simple structure.
Findings: It appears that more liberal generalizations of research results from the tightly controlled experimental settings to conventional learning situations are justified.
Duration: December 1965-September 1966.
Investigator(s): Glenn E. Tagatz, Ph.D., Associate Professor, and Dean L. Meinke, Assistant Professor, Department of Education/Psychology, Indiana State University, Terre Haute, Ind. 47809; and Elmer A. Lemke, Ph.D., Associate Professor, Illinois State University, Normal, Ill. 61761.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

21-DC-9 AROUSAL OF INFANTS IN LEARNING AND DEVELOPMENT

Purpose: To identify individual characteristics in infant behavior which may be used to determine optimal stimulus conditions for evoking and reinforcing infant responses; specifically, to test hypothesis that response acquisition will be more efficient under optimal stimulus match conditions than under non-match conditions.
Subjects: Infants, one to seven months old.
Methods: Observation of visual fixation responses, autonomic responses, and movement to determine reliable patterns of individual infants. Using these patterns, discrimination learning tasks are developed in which some situations present stimuli that match the infant's response patterns and others do not.
Duration: Phase I: July 1965-January 1967.
Investigator(s): Frances Degen Horowitz, Ph.D., Associate Professor, Department of Human Development, and Research Associate, Bureau of Child Research, University of Kansas, Lawrence, Kan. 66044.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.

21-DC-10 AN INVESTIGATION OF PERCEPTUAL AND STORAGE MECHANISMS IN CHILDREN WITH LEARNING DISORDERS AND EMOTIONAL PROBLEMS

Purpose: To extend knowledge of mechanisms underlying dichotic listening performance (DLP) through study of performance of normal children. Two previous investigations have indicated that DLP involves both perceptual and short-term storage processes that might be expected to increase in efficiency with the advance of normal childhood development. Also, to discover if either or both of these perceptual and storage functions might be impaired in children with learning disorders and emotional problems.
Subjects: 120 normal children, 19 learning disordered children, and 20 emotionally disturbed children, all ages 5 to 10.
Methods: The 120 normal children were tested for dichotic listening performance; 19 children with learning defects were compared on DLP with 19 normal children matched for age, sex, and approximate intelligence; and 20 children with emotional disturbance were similarly compared with another 20 matched normal children.
Findings: Short-term memory function is a powerful source of variation in DLP, as also is age in childhood. Ear-asymmetry is a weaker source of variation. Short-term memory function is affected when brain pathology or cerebral surgery has produced learning impairment in man. Study suggests that children with learning disorders are impaired, compared to controls, on both perceptual and storage aspects of performance, whereas emotionally disturbed children differed little from controls on either aspect of performance.
Duration: May 1965-April 1966.
Investigator(s): James Inglis, Ph.D., Professor of Psychology, Health Sciences Center, Temple University, Philadelphia, Pa. 19129; and Robert F. Briggs, M.D., Assistant Professor of Psychiatry, Queen's University, Kingston, Ontario, Canada.
Cooperating group(s): Ontario Mental Health Foundation.
Publication: Proceedings of the Seventh International Congress of Gerontology. Vienna: Vienna Academy of Medicine, 1966; paper presented at annual meeting of the Canadian Psychological Association, Montreal, June 1966; paper to be presented at annual meeting of the Canadian Psychological Association, Ottawa, June 1967; Human Development, in press, 1967; others.

21-DD-1 IRREVERSIBLE MATURITY INDICATORS IN MENTAL TEST ITEMS

Purpose: To study the behavioral tasks as performed by a large number of children in mental or developmental test situations to discover what they reveal about stages in development as set forth by Piaget.
Subjects: 3,583 protocols, ages 3 months to 13 years. These included longitudinal records for 737 children and individual records for 2,109 children.
Methods: Records on success or failure on items from six different mental tests were obtained. An array of maturationally dependent items was obtained by working out (by computer) the probability of failure on an item if another easier item had been failed, or of failing an item if another easier item had been passed. Only items for which P_1=o when P_2=100 or P_1=100 when P_2=o were included in the study. Piaget's developmental stages for object concept, spatial field, and intelligence were analyzed and compared with these probability findings to discover the degree of agreement of the two approaches to maturational development. A ranked order of difficulty was worked out for each item according to age.
Findings: The mental test item relationships confirm Piaget's object

concept and spatial field theories, but indicate weakness and narrowness in his concept of intelligence. As analyzed in these data, his categories appear to be arbitrary and too limited in scope.
Duration: September 1965-March 1967.
Investigator(s): Rachel S. Ball, Ph.D., Professor Emeritus, Department of Psychology, Arizona State University, Tempe, Ariz. 85281.
Cooperating group(s): The Merrill-Palmer Institute, Detroit, Mich.; Kent State University, Kent, Ohio; National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: A duplicated bound report is being prepared for the National Institute of Child Health and Human Development, and a limited number of additional copies will be available.

21-DD-2 INVESTIGATION OF THE DIAGNOSTIC SENSITIVITY OF THE KTK PERFORMANCE SCALE IN REVEALING HIDDEN DEVELOPMENTAL POTENTIAL IN APPARENTLY RETARDED, BRAIN-DAMAGED, AND EMOTIONALLY DISTURBED CHILDREN

Purpose: To find out whether performance tests are less vulnerable to the ravages of emotional and organic pathology. Reliance on too verbal tests may set the aim for rehabilitation too low.
Subjects: At least 30 9.6- to 10.5-year-old boys and girls in Finland diagnosed as emotionally disturbed, convulsive, brain-damaged, retarded, bilingual (speaking neither language adequately), those with reading-spelling impairment, and a normal group. Groups were supplemented with another normal group from rural and isolated areas.
Methods: The KTK Performance Scale, Draw-A-Person, and a vocabulary test were given individually to each child.
Duration: January 1966-June 1967.
Investigator(s): Anna S. Elonen, Ph.D., Professor of Psychology, Children's Psychiatric Hospital, University of Michigan, Ann Arbor, Mich. 48104.
Cooperating group(s): Foundations' Fund for Research in Psychiatry.
Publication: To be published as a monograph by Acta Academiae Pedagogical Jyväskyläensis. Can be obtained from the library of the University of Jyväskyla, Jyväskyla, Finland.

21-DD-3 ABOVE AVERAGE I.Q. SCORES AND FUTURE SCHOOL ACHIEVEMENT

Purpose: To study the relationship between group and individual I.Q. scores of children of above average intellectual capabilities; to determine which, if any, of the I.Q. test scores is a significant, more accurate predictor of future scholastic achievement; to ascertain whether there is justification for eliminating individually administered tests of intelligence in programs for the selection of pupils of above average intellectual ability.
Subjects: 60 children of above average intellectual capabilities.
Methods: School achievement test results of approximately 10 6th, 7th, 8th, 9th, and 12th grade students, half of them male and half female, who were tested two to three years before on the Lorge-Thorndike Group Intelligence Test, the Stanford-Binet (L-M), WISC or WAIS Individual Tests of Intelligence, will be statistically analyzed by means of product-moment correlations to determine whether there are statistically significant differences between the accuracy of the I.Q. tests in predicting future school achievement. Possibly, such variables as grade level, sex, and time interval may also be analyzed to determine their effects on the dependent variable of school achievement.

Findings: With respect to students of above average intellectual development, it would appear that the numerical value of a student's I.Q. score is not as valid or significant in measuring his "immediate" school achievement, or for selecting a student for inclusion in an accelerated or enrichment program, as is the relative standing of the individual I.Q. score in the group of students involved. Percentile or standard score appears to be a much more valid and valuable measure as a selection device or predictor of school achievement. It may be speculated that a school system limited in resources, time, and personnel might validly use the results of group I.Q. tests for the selection and identification of students of above average intellectual development, provided the scores are reported in such a way that the individual student's standing in his or her particular group class level or sex is taken into consideration.
Duration: September 1962-January 1967.
Investigator(s): Bert Friedman, Ph.D., School Psychologist, Ballston Spa Elementary School, 70 Malta Ave., Ballston Spa, N. Y.
Cooperating group(s): New York State Department of Education.
Publication: Annual reports may be requested from principal investigator or New York State Department of Education, Albany, N. Y.

21-DE-1 AGE, SEX, AND TYPE OF MEMORY INFORMATION IN CONCEPT LEARNING

Purpose: To explore effect on concept learning of (1) different amounts of available information; (2) variation in type of previous information, i.e., correct, incorrect, and both correct and incorrect responses; (3) sex; and (4) age.
Subjects: 135 male and 135 female volunteers, ages 10 to 18.
Methods: Subjects are divided into three age groups and randomly assigned within each group to experimental conditions. Design is a 3X3X3X2 factorial which includes three levels of instance availability, viz., zero, one, or two of the previously presented instances will be available for subjects' visual inspection on any trial; three conditions of type of available instances, i.e., correctly sorted instances only, incorrectly sorted only, and both correctly and incorrectly sorted; three age groups, labeled X, Y, and Z, and sex. Subjects are asked to categorize 64 stimuli each with a different geometric pattern, into four categories. Each card contains one, two, three, or four identical figures in one or four colors. Form is the relevant dimension. A sorting tray with four double slots, labeled either A, B, C, or D, is in front of the subject. When the required level of availability is reached, the earliest of all exposed instances is removed.
Duration: January 1962-February 1967.
Investigator(s): Vladimir Pishkin, Ph.D., Associate Professor of Medical Psychology, Department of Psychiatry, Neurology, and Behavioral Sciences, Oklahoma University Medical School, Oklahoma City, and Chief Research Psychologist; and A. Wolfgang, Ph.D., Research Associate in Psychology, Behavioral Science Laboratories, Veterans Administration Hospital, 921 N.E. 13th St., Oklahoma City, Okla. 73104.
Cooperating group(s): U. S. Veterans Administration.

21-DE-2 HOW CHILDREN CONCEPTUALLY ORGANIZE MUSICAL SOUNDS

Purpose: To test the relevance of one aspect of Piaget's theory of concept development, namely, that of the principle of conservation, to musical growth and development.
Subjects: Two groups of 80 children each, stratified by age and sex.

Methods: Musical tasks are administered to the first group in a preliminary testing. Refined versions of these tasks are then administered to the second group. This group is pre-tested for conservation of tone and rhythm and then randomly assigned to experimental training procedures designed to identify the relationship between decentration and conservation and to separate tonal memory from conservation. Following training procedures, post-tests for conservation of tone and rhythm will be administered. Data will occur in terms of right or wrong answers which will be analyzed as proportions of the total group and by complex cross-classification procedures. The protocol of each subject will be analyzed according to Piaget's methodology.
Duration: February 1966-January 1968.
Investigator(s): Dr. Marilyn Pflederer, Associate Professor of Music Education, and Lee B. Sechrest, Ph.D., Associate Professor of Psychology, Northwestern University, Evanston, Ill. 60201.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

21-DE-3 MEDIATION AND TRANSFER IN CONCEPT FORMATION

Purpose: To identify, via experimental techniques such as transfer designs, those processes of a conceptual nature involved in children's discrimination learning.
Subjects: Nursery school, kindergarten, and third grade pupils; West African children and adults also used in other studies.
Methods: Initial experimentation used standard discrimination learning techniques, including reversal and non-reversal shift designs and optional shift designs. Further studies used transfer designs. Additionally, pilot work was performed utilizing paired-associate learning of conceptually ordered materials.
Findings: (1) Optional shift behavior is influenced by both mediational ability and perceptual factors in the youngest age groups; (2) different transfer functions are indicated for nursery school and kindergarten children as opposed to third graders; (3) evidence has been found for strategies of "contingent" or "non-contingent" learning of discriminations which are independent of stimulus dimensions and hence, do not reflect mediation in the classically understood sense.
Duration: September 1965-August 1966.
Investigator(s): Joseph A. Glick, Ph.D., Assistant Professor of Psychology, Yale University, New Haven, Conn. 06510.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Articles in press and in preparation.

21-DF-1 ASSESSING AND DEVELOPING THE CREATIVE THINKING ABILITIES OF PRE-SCHOOL CHILDREN

Purpose: To improve present methods and devise new ones for assessing the creative thinking abilities of pre-school children; to describe psychometrically the creative development process from ages three to six; and to determine what factors inhibit and facilitate.
Subjects: 250 children, ages three to six.
Methods: Longitudinal, experimental, psychometric case study.
Duration: September 1966-continuing.
Investigator(s): E. Paul Torrance, Ph.D., Chairman, Department of Educational Psychology, University of Georgia, Athens, Ga. 30601.

Cooperating group(s): Research and Development Center in Continuous Educational Stimulation, University of Georgia.
Publication: Journal articles, books, and monographs planned.

21-DG-1 ON THE LEARNING OF SPEECHLIKE VOCABULARIES: AN EXPERIMENTAL STUDY WITH CHILDREN

Purpose: To determine whether perception of a speechlike continuum exists.
Subjects: 24 fifth grade children.
Methods: Subjects will have satisfactorily completed a number of screening tests of vision, hearing, speech, and intelligence. They are asked to identify certain acoustic stimuli that will constitute a number of ensembles. Eight different stimuli comprise an ensemble. Physical characteristics of stimuli are manipulated in several ways: general structure of elements in a given ensemble are arranged to be more or less like speech, and information in ensembles is coded primarily into one, two, or three physical parameters (frequency, intensity, and time).
Duration: Not reported.
Investigator(s): Kenneth W. Burk, Ph.D., and John H. Gilbert, Graduate Student, Speech and Hearing Clinic, Purdue University, Lafayette, Ind.
Cooperating group(s): Purdue University Research Foundation.

21-DG-2 RELATIONSHIPS BETWEEN PERCEPTION AND READING

Purpose: To investigate at three different age levels the relationships between perception (i.e., size constancy, shape constancy, spatial orientation, and speed of processing information) and reading achievement as assessed by the comprehension section of the California Reading Test and the Gates Diagnostic Reading Test.
Subjects: Approximately 80 elementary school children, 40 girls and 40 boys, ages 7, 9, and 11.
Methods: Size constancy will be measured in terms of extent to which judgments of the size of a disc approximate actual size of the disc despite variation in distance of disc from subject. Shape constancy will be defined as extent to which judgments of the shape of a circle viewed obliquely correspond to actual shape of the circle. Spatial orientation will be defined as extent to which, under varying amounts of body tilt, judgments of verticality, as indicated by adjustments of the position of a rod in a two dimensional space, approximate the objective vertical. Speed of processing information will be measured in terms of ability to select from a prepared list words and phrases matching stimuli flashed on a screen and followed by interfering stimuli (i.e., nonsense syllables). Correlation coefficients will be computed at each age level for each of the possible pairs of variables under study.
Duration: September 1965-August 1967.
Investigator(s): John R. Bergan, College of Education, University of Arizona, Tucson, Ariz.; Robert W. Ridgway, and Dale P. Scannell, Professors of Education, University of Kansas, Lawrence, Kans. 66045.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

21-DH-1 A LONGITUDINAL STUDY TO ESTABLISH NEUROLOGICAL AND LINGUISTIC DIFFERENTIAL CRITERIA FOR NON-VERBAL CHILDREN

Purpose: To attempt to establish differential criteria for the following groups of non-verbal children: aphasic, autistic, mentally retarded, and hearing impaired.
Subjects: Children in age range from three to eight referred to Institute for Childhood Aphasia for diagnosis and/or training.
Methods: Examination of clinical histories (medical, developmental, etc.), neurological examination, including electroencephalographic, psychodiagnostic, and linguistic. Factor and cluster analyses of 30-40 entries for each child.
Findings: Preliminary findings indicate that differences will be found for some or all groups.
Duration: September 1965-August 1968.
Investigator(s): Jon Eisenson, Ph.D., Professor of Speech Pathology and Audiology and Director, Institute for Childhood Aphasia, and Thomas Forrest, M.D., Pediatric Neurologist, Institute for Childhood Aphasia, School of Medicine, Stanford University, Palo Alto, Calif. 94304.
Publication: Results will probably be submitted to neurological and pediatric journals.

21-DH-2 TOWARD AN OBJECTIVE MEASURE OF STRUCTURAL COMPLEXITY OF CHILDREN'S LANGUAGE

Purpose: To explore indices of language development; to establish a basis for a standardized instrument for objectively measuring structural complexity of children's language.
Subjects: 80 pupils in grades four, six, and eight in High Point, N. C. public schools. Mean I.Q. for grade four was 113; for grade six, 117; for grade eight, 109.
Methods: Children were asked to re-write a narrative composed of simple declarative sentences by combining short sentences to make longer sentences. In this way, they could demonstrate their ability to combine kernel structures to form sentences of greater structural complexity. Each child's writing was segmented into minimal terminable syntactic units. Mean number of words per clause, mean number of clauses per T-unit, and mean number of words per T-unit were computed. Statistical analysis of variance was executed to test mean differences at various grade levels for significance at the .01 level.
Findings: Mean words per clause increased from 6.41 for grade four to 7.11 for grade six to 8.17 for grade eight (F ratio, 22.78). Mean clauses per T-unit increased from 1.14 to 1.30 to 1.45 for the three grades (F ratio, 23.23). Mean words per T-unit increased from 7.37 to 9.27 to 12.01 (F ratio, 39.20). Increments on each of the three measures are significant at the .01 level. Analysis based on techniques of transformational-generative grammar indicates that clause length and number of clauses per T-unit reflect syntactic complexity; since T-unit length is accounted for by a combination of these two factors (mean clause length x mean clauses per T-unit x mean T-unit length), it appears that T-unit length alone is a satisfactory measure of structural complexity. The apparent success of this method indicates feasibility of designing a standardized instrument for measuring structural complexity.
Duration: November 1965-October 1966.
Investigator(s): Roy C. O'Donnell, Ph.D., Associate Professor, Department of English Education, Florida State University, Tallahassee, Fla. 32306.
Cooperating group(s): Research Council, University of North Carolina at Greensboro.
Publication: Plans indefinite.

21-DH-3 STUDIES OF THE ROLE OF SPEECH IN THE PROBLEM-SOLVING OF ADVANTAGED AND DISADVANTAGED YOUNG CHILDREN

Purpose: To explore the interrelation between development of conceptual abilities and language; to examine how disadvantaged youngsters use their basic vocabulary in problem-solving, i.e., are they less likely to spontaneously introduce the words into problem-solving and, when they use the words, will they be less likely to facilitate problem-solving.
Subjects: Pre-school and primary grade children.
Methods: A delayed-reaction situation was employed in which children had to remember the serial order of common objects. Performance was observed both when the children were prompted to name the objects and when they were not. Performance was observed in two senses: memory, and the use of names of objects to be remembered during the delay period. Also, a study is being developed which will utilize a more complex problem-solving situation, namely, one involving making reversal and non-reversal shifts.
Findings: Six-year-old middle class children were more likely to spontaneously use common names to memorize the series than five-year-old middle class children and five- and six-year-old poor children. Naming tended to facilitate memory performance on easier problems (two pictures) and to interfere on harder problems (three pictures).
Duration: June 1965-September 1967.
Investigator(s): Gerald Gratch, Ph.D., Associate Professor, Department of Psychology, University of Houston, Houston, Tex. 77004.
Cooperating group(s): Head Start Project, U. S. Office of Economic Opportunity; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Paper available from Dr. Gratch; journal article planned.

21-DH-4 ACQUISITION OF JAPANESE AS A NATIVE LANGUAGE

Purpose: To follow the development of competence in a language historically unrelated to English, so as to evaluate the hypothesis that initial stages of language acquisition reflect children's inborn capacities for language.
Subjects: Two children, now three years old, both of whom live in Tokyo, Japan.
Methods: Children are visited twice a month in their homes. Everything said is tape recorded. Emergence of selected grammatical forms can be traced, *ex post facto*.
Findings: Japanese- and English-speaking children construct sentences on same basic principles, none of which is exemplified in the respective adult speech.
Duration: September 1965-indefinite.
Investigator(s): David McNeill, Ph.D., Associate Professor, Department of Psychology, University of Michigan, Ann Arbor, Mich. 48104.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: In *The Genesis of Language*, F. Smith and G. A. Miller (Eds.). Cambridge: MIT Press, 1966. In *Psycholinguistic papers*, J. Lyons and R. J. Wabes (Eds.). Edinburgh: The University of Edinburgh Press, 1966.

21-DH-5 COMPARATIVE STUDY OF LANGUAGE DEVELOPMENT AND SOCIALIZATION

Purpose: To examine language development in languages other than English, the development of the social aspects of language use and adult attitudes and practices regarding these, and the effects on child language development of these varying practices; also, to train a team of students who will do field work as part of a comparative project.

Subjects: Families selected for sociological properties in a number of societies and ethnic groups in the United States.

Methods: Observation of family-child and peer-child interaction, questionnaires, testing of language development.

Duration: July 1966-1968.

Investigator(s): Susan M. Ervin-Tripp, Ph.D., Associate Professor of Speech, and Dan I. Slobin, Ph.D., Assistant Professor of Psychology, University of California, Berkeley, Calif. 94720.

Publication: Field manual for use of other field workers; joint volume of comparative findings; individual dissertations and other individual publications planned.

21-DH-6 THE EFFECT OF BILINGUALISM AS MEASURED BY 17 HOLTZMAN INKBLOT TEST VARIABLES

Purpose: To study the effect of degrees of bilingualism upon the responses to culture free stimulus material (inkblots) as measured by 17 computer-scored variables; to test the hypotheses that cultural background produces personality differences which can be measured by HIT variables, and that requiring a person to respond in his less proficient language will produce measurably different scores than those secured by responses in the other language.

Subjects: 120 students from grades 7 through 12 who are generally considered to be bilingual.

Methods: Subjects are divided into three groups according to linguistic proficiency, which is determined by a combination of questionnaire self-ratings by the students and ratings by teachers. Students are also divided into three groups according to the strength of cultural background influences. Holtzman Inkblot Tests are group-administered to students in one language, followed in one week by administration in the other language. Testing is in three school grade groups (7-8, 9-10, 11-12), half of which take the test first in each language, utilizing Forms A and B of the Holtzman Inkblot Test to accomplish this counter-balanced testing procedure.

Duration: Not reported.

Investigator(s): Donald R. Gorham, Ph.D., Coordinator of Research, and Louise W. Green, B.S., Research Assistant, Psychology Research Laboratory, Veterans Administration Hospital, Perry Point, Md.; and Mary Tamm (Ph.D. Candidate, University of Mexico), Guidance Counselor, American School, Mexico City, Mexico.

21-DH-7 THE BILINGUALISM DOMINANCE CONFIGURATION

Purpose: To conduct a methodological-conceptual inquiry designed to lead to better means of describing and quantifying bilingualism.

Subjects: Adolescents in New York City who speak Spanish and English.

Methods: Combination of observation, self-report, experimental, and test methods.

Duration: September 1966-August 1968.

Investigator(s): Joshua A. Fishman, Ph.D., Professor of Psychology and Sociology, Yeshiva University, New York, N. Y. 10019.

Personality

21-EA-1 EPIDEMIOLOGY OF CHILDHOOD DEVELOPMENTAL BEHAVIOR

Purpose: To accumulate data on the behavior of normal children which will be used as norms with which to compare the behavior of emotionally disturbed and brain-damaged children.
Subjects: 240 normal children, ages 6 to 12.
Methods: Children are given various tests designed to measure activity levels, fine and gross motor movements, the Orogranulorytic Migratory Rate, and the Finger Sweat Print to measure stress. Parents are given the LaPousse-Monk Behavioral Inventory.
Duration: March-May 1967.
Investigator(s): Irvin A. Kraft, M.D., Associate Professor of Psychiatry and Pediatrics, Baylor University College of Medicine, and Medical Director, Texas Institute of Child Psychiatry, Houston, Tex. 77025.
Publication: Publication planned upon completion.

21-EA-2 STIMULUS CHOICE BEHAVIOR OF CHILDREN

Purpose: To determine some of the stimulus properties which children prefer in free choice situations.
Subjects: Second, third, and fourth grade children.
Methods: A six choice apparatus was utilized in which the depression of a button activated a stimulus. A child could activate from one to six different stimuli depending on the experimental condition.
Findings: The preferred response strategies that a child brings to the experimental situation have an important influence on the observed behavior. Children also exhibited interesting sequences of selecting stimuli of differing complexities. Some information regarding stimulus alternation behavior was obtained.
Duration: January 1966-July 1967.
Investigator(s): F. Michael Rabinowitz, Ph.D., Assistant Professor, Department of Psychology, University of Washington, Seattle, Wash. 98105.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: American Psychologist 21:650, 1966. A paper has been submitted to Child Development. Papers are now being prepared for submission to Psychological Bulletin and Journal of Comparative and Physiological Psychology.

21-EB-1 SELF-CONCEPT, DEPENDENCY, AND DELINQUENCY

Purpose: To develop a measure of self-concept which meets the criterion of symbolic interactionism as a theory; to use that measure as an indicator of delinquency vulnerability; and to relate self-concept to dependency upon mother as a major source of social control over sons. The assumption is that boys who are over-dependent on mothers for self-definitions are less controllable by secondary others and consequently more likely to misbehave in extra-familial situations.
Subjects: 620 lower class boys, of whom 150 are Negro. Also included is a sample of 150 middle class white boys. All subjects range in age from 13 to 18.

Methods: Self-concept is measured by semantic differential scales covering concepts such as "I Am," "My Mother Thinks I Am," etc. The instrument is scored on four factors: evaluation, interpersonal qualities, potency, and activity. Mothers are interviewed with a schedule covering items related to control of sons in areas such as work, school, friends, activities, and friendship choices, and each mother completes the Shaeffer-Bell Scale.
Duration: September 1966-June 1968.
Investigator(s): Michael Schwartz, Ph.D., Associate Professor of Sociology, and Sheldon Stryker, Ph.D., Professor of Sociology, Indiana University, Bloomington, Ind. 47401.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Monograph is planned.

21-EB-2 EGOCENTRICITY IN CHILDREN AND SCHIZOPHRENICS

Purpose: To examine the relationship of children and schizophrenics of different developmental levels on their perspective-taking ability.
Subjects: 20 eight-year-old children and 20 schizophrenics.
Methods: One measure of developmental level and three measures of perspective-taking are given to subjects. Measure of developmental level is derived from the Rorschach test (Friedman, 1952). Perspective-taking situations are varied in content (impersonal and social) and in complexity. Two of the measures of perspective-taking require subjects to sit in front of a three-dimensional model (one model with impersonal content, one model with social content) and to choose the snapshot of the model that best represents the view that a small doll is supposedly seeing from different positions around the model (Piaget, 1956). The third perspective-taking measure requires subject to make up a story to a three-dimensional situation and then to re-tell the story from the point of view of each actor in the story (Feffer, 1959).
Duration: January-September 1966.
Investigator(s): Thomas Wolff, Department of Psychology, University of Rochester, Rochester; and Howard Friedman, Ph.D., Chief, Psychology Service, Veterans Administration Hospital, and Associate Professor of Psychiatry, State University of New York, Upstate Medical Center, Syracuse, N. Y.
Cooperating group(s): Veterans Administration.

21-EB-3 SELF-RATINGS ON INTELLIGENCE IN WHITE AND NEGRO CHILDREN

Purpose: To investigate differences in self-concept between Negro and white children as measured by self-ratings on intelligence.
Subjects: Similar groups of Negro and white children.
Methods: Self-concept measures were obtained through the use of the California Test of Mental Maturity, the Elementary-Short Form, and the Gibby Intelligence Rating Schedule (IRS). Reality-Discrepancy, Self-Discrepancy, and Ideal-Discrepancy scores were obtained.
Findings: Similar groups of Negro and white children differed significantly on measures of Reality- and Self-Discrepancies, but not on Ideal-Discrepancy; the magnitude and direction of these differences are dependent on the sex and I.Q. level of the children, as well as upon the specific measures being used.
Duration: September 1965-June 1966.
Investigator(s): Robert G. Gibby, Ph.D., Chief Clinical Psychologist, Veterans Administration Hospital, and Robert E. Gabler, B.S., Richmond, Va.

21-EC-1 PSYCHOLOGICAL PROCESSES IN MORAL DEVELOPMENT

Purpose: To separate effects of discipline from those of identification and other processes by which the parents' own moral orientation may influence the child.
Subjects: Approximately 200 seventh graders who are either "only" children or the older of two, and both of their parents.
Methods: Data on different aspects of subjects' moral orientation (guilt, moral judgments, moral values), parental discipline, and identification are obtained from children and from each parent. Child data are obtained in a closely monitored group setting; parents are interviewed individually.
Duration: June 1966-May 1970.
Investigator(s): Martin L. Hoffman, Ph.D., Professor of Psychology, University of Michigan, Ann Arbor, Mich. 48104.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Journal articles planned.

21-EC-2 THE EFFECT OF LEARNING TO CONSIDER ALTERNATIVES AND LONG-TERM CONSEQUENCES ON THE DEVELOPMENT OF VALUES

Purpose: To develop and test a program for teaching the child the method of working out daily situations by considering several alternative courses of action, examining the probable consequences (both short- and long-term) of each, and using such data in making a decision as to what course of action to follow.
Subjects: Pupils in grades three to five in selected Council schools.
Methods: A series of teaching units entitled "Learning to Decide" was prepared for use at the third, fourth, and fifth grade levels. These materials consider various ways of handling daily social situations and provide a number of specific situations in which the child is encouraged to list a variety of alternative methods for meeting the situation and the probable short-term and long-term consequences of each. He is then encouraged to make a decision using these data.
Duration: April 1966-indefinite.
Investigator(s): Ralph H. Ojemann, Ph.D., Director, Child-Educational Psychology and Preventive Psychiatry Division, Educational Research Council of Greater Cleveland, Rockefeller Bldg., Cleveland, Ohio 44113.
Cooperating group(s): The Grant Foundation.

21-EC-3 STORE PREFERENCES OF CHILDREN

Purpose: In an earlier exploratory study of children's consumer behavior, it was indicated that they, like adults, have favorite stores. The purpose of this study is to ascertain the elements of store preference among children and the factors that influence its development.
Subjects: 100 children, grades one through four.
Methods: Depth interviews guided by previous findings.
Duration: January 1967-September 1968.
Investigator(s): James U. McNeal, Ph.D., Head, Department of Marketing, Texas A. & M. University, College Station, Tex.
Publication: Probably in *Journal of Marketing Research*.

21-ED-1 DISORGANIZATION: PERSONAL AND SOCIAL

Purpose: To establish a systematic theory of personal and social disorganization, and to indicate how such a theory may be applied to the range of social problems.
Subjects: Adolescents.
Methods: Utilization of the sociological theory of personality growth and development. This theory is a step toward the systematic development of analytical insights and intellectual skills in dealing with the effect of social disorder on the individual in relation to various problems such as adolescent tensions, delinquency, crime, sexual disorders, alcoholism, mobility, the personal vices, mental pathologies, and suicide. Study illustrates the relationship between basic social disorder and individual symptoms.
Duration: 1963-1966.
Investigator(s): Herbert A. Bloch, Ph.D., Director, Division of Graduate Studies, Brooklyn College, Brooklyn, N. Y. 11210. (Reported by NCCD. See Note, p. 73.)

21-EE-1 STUDIES ON THE HYPERACTIVE CHILD

Purpose: To investigate effects of dextroamphetamine on behavior and intellectual functioning; to investigate the attentional deficit of the hyperactive child and to see how this is affected by (a) methylphenidate, and (b) varying the intensity and quality of auditory stimulation; to study the effect of methylphenidate on the behavior and cognitive functions of the hyperactive child, and to conduct follow-up studies on the group of 120 hyperactive children.
Subjects: 120 hyperactive children of normal intelligence, ages 5 to 12 years (psychotic, cerebral palsied, epileptic children excluded).
Methods: All investigations of the use of drugs are carried out by double-blind uncrossed designs. Control groups are used for all aspects of the study, and results analyzed statistically.
Findings: (1) Although about one-third of the hyperactive children had abnormalities of prenatal or perinatal period, this was non-significant when compared to a control group (direct hospital inspection of data). (2) Dextroamphetamine reduces hyperactivity and distractability and has a slight effect in improving tests of cognitive and motor functions.
Duration: 1961-indefinite.
Investigator(s): Gabrielle Weiss, M.D., Lecturer in Psychiatry, McGill University, and Psychiatrist, Montreal Children's Hospital, and Virginia I. Douglas, Ph.D., Associate Professor of Psychology, McGill University, and Senior Psychologist, Montreal Children's Hospital, 2300 Tupper St., Montreal, Quebec, Canada.
Cooperating group(s): Dominion Provincial Mental Health Grant; Ciba Pharmaceuticals; Department of National Health and Welfare of Canada.
Publication: Canadian Psychiatric Association Journal 9:2:120-130; Journal of the American Academy of Child Psychiatry 5:2, April 1966.

21-EF-1 ANXIETY IN HIGH SCHOOL STUDENTS AS A FUNCTION OF IMPULSIVENESS AND REACTIVE CURIOSITY

Purpose: To investigate the relationship between reactive curiosity (stimulus variation seeking) behavior, impulsiveness, and anxiety. This is part of a larger project intended to make explicit whatever stable relationships can be demonstrated between measurable personality variables.

Subjects: Approximately 500 high school students.
Methods: Correlation techniques are employed to evaluate the relationship between impulsiveness and reactive curiosity, and an analysis of variance approach is used to test the hypothesis that level of anxiety will differ, depending on the possible combinations of high versus low impulsiveness and reactive curiosity.
Duration: March 1967-1968.
Investigator(s): Willy A. Kouw, Ph.D., Assistant Professor, and Ernest Barratt, Ph.D., Research Professor, Department of Neurology and Psychiatry, University of Texas Medical Branch, Galveston, Tex. 77550.
Publication: Articles planned in psychological journals.

21-EF-2 THE DEVELOPMENT OF FEAR OF FAILURE IN THE CHILD

Purpose: To see what kinds of reinforcement patterns and what kinds of accent on independence training lead to a high score on the Hostile Press measure of fear of failure.
Subjects: 50 ninth grade males used in one study; 60 male college freshmen in another.
Methods: In the study with ninth graders a questionnaire was sent to the parents. College freshmen were interviewed. In both cases the Hostile Press measure (a modified TAT) was administered to the students approximately a week before the second part of the study. Questionnaire and interview were both designed to find out at what time parents began to put pressure on the children to perform independently (find their way around town, dress themselves, etc.), and what parents did in terms of reinforcement when the child came up to their standards and when he did not.
Findings: In both studies early accent on independence led to high Hostile Press. If parents were neutral when the child did as well as expected and punishing when he did not, the child tended to develop high Hostile Press. If he was rewarded when he came up to standard and the parents were neutral when he did not, he tended to be low in Hostile Press.
Duration: 1959-continuing.
Investigator(s): Richard C. Teevan, Ph.D., Professor of Psychology, Bucknell University, Lewisburg, Pa. 17837.
Cooperating group(s): Office of Naval Research.
Publication: Technical Reports; book to be published by Van Nostrand, Spring 1968.

21-EG-1 A STUDY TO EXPLORE NEW METHODS OF IDENTIFYING AND MEASURING MUSICAL TALENT

Purpose: To measure musical talent as a function of personality and cognitive variables assumed to operate within the individual, his attitudes and expectancies which may be considered to be motivational or inhibiting, the manner in which other persons act towards or regard him, as well as sex role, all interacting within a socio-cultural context.
Subjects: Samples are drawn from approximately 1,500 students graduating from high school in 1963.
Methods: 300 measures and data-gathering instruments were administered over a six-year period. Criteria are nine categories of musical performance such as membership in high school band or chorus, composing, arranging, and others. Predictor variables are scores on measures postulated to represent aspects of the theoretical categories of the research model. Multiple linear regression techniques were used to select efficient combinations of predictors representing the theoretical categories in the various analyses.

Duration: Not reported-May 1966.
Investigator(s): Wendell L. Osborn, Research Associate, and J. Carson McGuire, Ph.D., Professor, Department of Educational Psychology, University of Texas, Austin, Tex. 78712.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

21-EG-2 STANDARDIZED INTERVIEW NORMS ON ELEMENTARY SCHOOL CHILDREN

Purpose: To further develop and investigate the value of promising standardized interview techniques, which have been proven successful with adults, for use with school age children and adolescents; to make a beginning in obtaining normative material to see if neurotic and normal children differ in the same manner as has been reported for neurotic and normal adults.
Subjects: Normal children in grades 1, 3, 6, 7, 9, and 12, and a group of children from the University's clinic for emotionally disturbed children.
Methods: Interview consists of five five-minute periods in which the first is a period of free verbal exchange between subject and interviewer, the second, a silence period, referred to as the stress period, the third, a free response period, the fourth, a stress period in which the interviewer interrupts the subject 12 times or, if this is not possible within five minutes, as often as he can, extending the period to ten minutes if necessary, and the fifth, a free response period. A number of facets of the subject's behavior are scored: amount of speech and silence during each of the periods, number of times he overrides the interruptions of the interviewer, and his speed.
Duration: September 1965-August 1967.
Investigator(s): Michael Dinoff, Ph.D., Associate Professor of Psychology, and Director, Psychological Clinic, University of Alabama, Box 6142, University, Ala. 35486.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Psychological Reports 20:1:119-123, February 1967; two papers presented at Southeastern Psychological Association Conference.

Social

21-FA-1 OBJECTIVE MEASUREMENT OF SOCIALIZATION IN CHILDREN

Purpose: To determine periods and rates at which young children become verbally socialized.
Subjects: About 200 children, ages two and one-half to six and one-half.
Methods: Subjects are asked to respond to a set of standard items broadly representative of both the values of the culture, *per se*, and of the entire range of social desirability.
Duration: July 1965-May 1967.
Investigator(s): James A. Walsh, Ph.D., Associate Professor of Psychology, Iowa State University, Ames, Iowa.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Psychological Reports 20:1:295-304, February 1967.

21-FB-1 THE ATTITUDES OF CINCINNATI JUNIOR HIGH SCHOOL PUPILS TOWARD CINCINNATI POLICE OFFICERS

Purpose: To determine the attitudes of Cincinnati junior high school pupils toward the police officers of that city.

Subjects: Approximately 200 students in one Cincinnati junior high school; 971 students in four junior high schools in the city.

Methods: Initial group of 200 was utilized in constructing an "Attitude-Toward-Police" Scale by standard Thurstone methods. The second group of 971 was then measured by the ATP Scale. Each pupil furnishes information on age, sex, grade, etc., in addition to a scale score. As far as subjects know, all measuring is done anonymously. Scores are analyzed to determine whether significant differences in attitude exist with respect to age, race, sex, school achievement, grade level, church attendance, and socio-economic level (as measured by parent occupation and home ownership).

Findings: Twelve-year-olds have more favorable attitudes toward police than do children ages 14 to 16; thirteen-year-olds have more favorable attitudes than fifteen- or sixteen-year-olds; girls have more favorable attitudes than do boys of their race; whites have more favorable attitudes than do Negroes of their sex; pupils in high ability school groups at any grade level have more favorable attitudes than do pupils in low ability groups; boys who attend church regularly have more favorable attitudes than do boys who do not attend regularly; no conclusive evidence of significant effect of socio-economic level.

Duration: Ongoing.

Investigator(s): Dr. Robert Portune, Teachers College, University of Cincinnati, Cincinnati, Ohio 45221. (Reported by NCCD. See Note, p. 73.)

Cooperating group(s): Cincinnati Board of Education; Cincinnati Police Division.

21-FC-1 RELATION OF SMOKING BEHAVIOR TO SOCIAL STRUCTURE OF STUDENT BODY, HIGH SCHOOL STUDENTS

Purpose: To learn how differentials in onset of smoking, amount smoked, and attitudes to smoking associate with the "crowd" or "group" in high school with which individual students identify.

Subjects: About 200 sophomores, juniors, and seniors in one public and one parochial high school in Milwaukee.

Methods: Main instrument is a pre-coded and self-administered questionnaire, taking 20 to 30 minutes, used with randomly selected homeroom classes in two high schools.

Findings: Preliminary analysis indicates that "crowd" affiliation is an effective predictor of the individual's smoking behavior.

Duration: November 1966-November 1967.

Investigator(s): Edward Wellin, Ph.D., Professor of Anthropology and Social Welfare, University of Wisconsin, Milwaukee, Wis. 53201.

Publication: Paper to be presented at scholarly or professional meeting in Fall 1967 or Spring 1968.

21-FD-1 PARENT PERCEPTION AND SOCIAL ADJUSTMENT AMONG ELEMENTARY AND HIGH SCHOOL STUDENTS

Purpose: To measure parent identification by school age children prior to development of recognized psychiatric disturbances; to test hypothesis that children who revealed inappropriate parent identification would be

rated by fellow students and teachers as more aggressive or withdrawn rather than socially integrative significantly more often than those children who showed normal parent identification.
Subjects: 250 boys and 250 girls, 50 each in 4th, 6th, 8th, 10th, and 12th grades.
Methods: A 140-item parent perception questionnaire was administered to each child. A sociometric scale of 10 items was administered to students in classroom context. These items were categorized as socially integrative, withdrawn, or aggressive. Teachers also rated each student in a forced choice technique on a 10-item rating scale. The student and teacher ratings were combined to categorize the students into one of the three major categories. Students were categorized on the parent perception questionnaire into three groups--one-half standard deviation below the mean; from one-half standard deviation below to one-half above; and above one-half standard deviation. This gave a three by three table from which a chi-square analysis was done. Data for the boys and girls were analyzed separately, and a significant chi-square beyond .001 was obtained for both males and females.
Duration: Winter 1965-indefinite.
Investigator(s): Kenneth R. Piety, Ph.D., Assistant Chief, Psychology Service, Veterans Administration Hospital, Murfreesboro, Tenn. 37130.
Cooperating group(s): Tennessee Public Schools.
Publication: Paper to be published; information available from investigator.

21-FD-2 IDENTIFICATION OF MALE ADOLESCENTS

Purpose: To study identification in adolescent males in order to compare schizophrenic diagnosed sample with delinquents and normals.
Subjects: Three sub-samples of adolescent males, matched for I.Q. and socio-economic status: Western State Hospital adolescent patients diagnosed as schizophrenic, young male offenders admitted to Cascadia Juvenile Diagnostic Center, and samples drawn from a local high school.
Methods: A specially designed version of the Osgood Semantic Differential is administered to each subject. Sub-samples are matched for I.Q. and socio-economic status.
Duration: January 1964-June 1967.
Investigator(s): John B. Marks, Ph.D., Director, Mental Health Research Institute, P.O. Box 907, Ft. Steilacoom, Wash. 98332.
Cooperating group(s): Cascadia Juvenile Diagnostic Center and Mt. Tahoma High School.

21-FE-1 DEVELOPMENTAL STUDY OF VERBAL COMMUNICATION

Purpose: To obtain comparative descriptions of performance in a two-person communication task over the age range of 2 to 18 years; to develop an analysis of factors involved in the growth of communication skills and abilities.
Subjects: Pre-school, school, and college students.
Methods: Subjects are given various forms of a two-person communication task in which one subject describes low-encodable stimuli (such as novel geometric forms) to another subject. Adequacy of the message is assessed through listener accuracy and a number of linguistic measures.
Findings: The experimental paradigm yields orderly, reliable developmental data; communication abilities develop slowly, perhaps not reaching asymptote until the middle teens; and a number of specific variables which seem to mature at different rates have been isolated.

Duration: January 1966-January 1969.
Investigator(s): Sam Glucksberg, Ph.D., and Robert M. Krauss, Ph.D., Assistant Professors of Psychology, Princeton University, Princeton, N. J. 08540.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Journal of Experimental Child Psychology 3:333-342, 1966; three additional papers in preparation.

21-FE-2 DEVELOPMENT OF NORMAL HUMAN COMMUNICATION SKILLS

Purpose: To study systematically the development of communication skills in children; to standardize and validate test items used in the current testing; and to construct an evaluation manual that can be used clinically for objective and standardized assessment of speech and language levels.
Subjects: 750 normal children between the ages of 3 months and 96 months. Distribution is 50 children, 25 males and 25 females, obtained at designated age intervals.
Methods: Speech and language items from an Experimental Language Manual are administered to each child and responses recorded on score sheets. Tape recordings are made of the vocalizations of each child. Analysis of response to test items is separated into two main areas: verbal comprehension and verbal communication. Articulation and intelligibility ratings and a detailed analysis of linguistic complexity will be carried out.
Duration: October 1965-October 1968.
Investigator(s): Herold S. Lillywhite, Ph.D., Professor of Speech Pathology and Director, Speech and Hearing Department, Crippled Children's Division, University of Oregon Medical School, Portland, Ore. 97201. (Reported by C. Donald Nelson, Crippled Children's Division.)
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: A developmental standardized evaluation manual that can be used clinically for objective assessment of speech and language levels will be published, together with a complete test kit. Preliminary findings of certain aspects of the test may be published as journal articles.

SPECIAL GROUPS OF CHILDREN

Physically Handicapped

21-GA-1 A SURVEY OF CHILDHOOD ASTHMA

Purpose: To study the epidemiology of asthma.
Subjects: 2,700 children resident in Aberdeen at a given date and born between 1950 and 1955.
Methods: Medical questionnaires are issued and filled in by all parents or guardians. From these, all possibly asthmatic children are listed, and the child and parents or guardian are interviewed. Child is physically examined and respiratory function testing is carried out. Medical data will be correlated with the sociological information gathered from the survey.
Duration: April 1964-1968.
Investigator(s): R. G. Mitchell, M.D., Professor of Child Health; Blanche M. Dawson, M.B., Research Fellow in Child Health; and Raymond Illsley, Professor of Sociology, University of Aberdeen, Foresterhill, Aberdeen, Scotland.
Cooperating group(s): Association for the Aid of Crippled Children, New York.

21-GA-2 NATIONAL SURVEY OF THE FACILITIES FOR FURTHER EDUCATION, TRAINING, AND EMPLOYMENT OF SCHOOL LEAVERS WITH SEVERE OR MULTIPLE HANDICAPS

Purpose: To survey the nationwide facilities for school leavers with severe or multiple handicaps.
Subjects: All pupils with severe or multiple handicaps who are now spending their final year at school and young people with severe or multiple handicaps who left school two years ago.
Methods: A questionnaire will be devised for completion by teachers aiming to elicit their views of the nature of the child's handicap in relation to his potentiality for further training and eventual employment. On the basis of the replies, the research team will formulate an operational definition for selecting the subjects, and their "fate" will be followed through to investigate how far plans made are being translated into practice. The retrospective study will trace back how far arrangements, recommended as suitable three years ago, were found to be practicable.
Duration: January 1967-December 1970.
Investigator(s): Stanley Gooch, B.A., Senior Research Officer, National Bureau for Co-operation in Child Care, Adam House, 1 Fitzroy Square, London, W.1., England. (Reported by M. L. Kellmer Pringle, Ph.D., Director, National Bureau for Co-operation in Child Care.)
Cooperating group(s): All schools for pupils with severe or multiple handicaps; Ministry of Labour and Youth Employment Officers, Department of Education and Science; Ministry of Health.
Publication: Probably in Studies in Child Development (British).

21-GA-3 NATIONAL STUDY OF PHYSICAL, SENSORY, AND MULTIPLE HANDICAPS IN A NATIONAL COHORT OF CHILDREN

Purpose: To make a detailed and comprehensive study on a national scale of a representative sample of seven-year-olds who have physical handicaps, defects of the special senses, and those who are multiply handicapped; to compare the perinatal history of the handicapped groups with that of the main sample of children, using suitable statistical techniques which allow for the collateral effect of socio-economic and environmental (post-natal) variables; and to select a sub-sample of handicapped children for subsequent more intensive and individual study, either on a national or on a regional basis.
Subjects: Those children from the National Child Development Study (1958 cohort) who are, at the age of seven, suffering from physical, sensory, or multiple handicaps.
Methods: Analysis of the comprehensive medical, educational, and sociological data available on all the children at the age of seven, as well as the data from the perinatal survey.
Duration: January 1967-January 1968.
Investigator(s): E. Alberman, M.D., D.C.H., Research Medical Officer, National Bureau for Co-operation in Child Care, Adam House, 1 Fitzroy Square, London, W.1., England. (Reported by M. L. Kellmer Pringle, Ph.D., Director, National Bureau for Co-operation in Child Care.)
Cooperating group(s): National Fund for Research Into Crippling Diseases.

21-GC-1 MEASUREMENT OF BEHAVIORAL AND INTELLECTUAL PROBLEMS IN CHILDREN WITH SEIZURES

Purpose: To study the finer central nervous system disorders in children with epilepsy and the interaction of environmental and organic factors.
Subjects: Children referred for evaluation of seizure disorders to the Seizure Clinic, Johns Hopkins Hospital.
Methods: Children will have a routine psychometric, neurologic, and sociological evaluation carried out on a standardized protocol based on that currently in use by the Johns Hopkins Child Growth and Development Clinic. This evaluation can then be used against normal and other chronic disease controls already investigated by the Child Growth and Development Study. Two hundred children should be identified within the first year and will be followed for a period of two years, to observe the evolution of any behavioral or psychological problems and to establish control over this evolutionary process.
Duration: July 1966-June 1969.
Investigator(s): Samuel Livingston, M.D., Project Director, Seizure Clinic, and Dennis Whitehouse, M.D., Assistant Professor of Pediatrics, Project Coordinator, Seizure Clinic and Pediatric Coordinator, Child Growth and Development Study, Johns Hopkins Hospital, Baltimore, Md. 21205.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-GC-2 AN INVESTIGATION OF NEUROLOGICAL, PSYCHOLOGICAL, AND SOCIAL FACTORS RELATED TO EMPLOYABILITY OF PERSONS WITH EPILEPSY

Purpose: To study employment problems of persons with epilepsy in order to isolate some of the significant variables determining "employability" or "employment readiness," and ultimately, vocational success or failure.

Subjects: An adult employed and an adult unemployed group; also a prevocational group of junior or senior year high school students or persons graduated within the previous six-month period ranging in age from 17 to 19.
Methods: Data were obtained on: convulsive disorder, psychological status, occupational status, attitudes, employee information, and vocational action or motivation. Psychological battery included WAIS, Bender, Bender-Recall, Minnesota Percepto-Diagnostic, Halstead-Reitan Neuropsychological Battery, CPI, EPPS, Jenkins Interest Test, Work Values, Manifest Anxiety Scale, and Employment History Interview. Neurological evaluation consisted of clinical neurological examination, seizure history, and EEG.
Findings: Significant differences between employed and unemployed adult epileptics on a substantial number of measures that relate to employability suggest a continuum of employability from very poor employability prognosis to very good prognosis. Social adaptabilities appear to be as important as seizure control and perhaps even more important in the final outcome.
Duration: January 1964-December 1966.
Investigator(s): R. D. Dennerll, Ph.D., Executive Director, Michigan Epilepsy Center, 10 Peterboro, Detroit, Michigan 48201. (Reported by Melvin L. Schwartz, Ph.D., Chief of Neuropsychology, Michigan Epilepsy Center.)
Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.
Publication: Epilepsia (in press).

21-GC-3 PSYCHOLOGICAL IMPLICATIONS OF CYSTIC FIBROSIS AND OTHER CHRONIC DISEASES OF CHILDHOOD

Purpose: To determine the nature of psychological problems and the unmet needs of cystic fibrotic children and their parents; to discover ways in which psychiatrists, other physicians, and rehabilitation agencies could help in the overall management of patients with this disorder.
Subjects: Six girls and five boys, ages 4-1/2 to 19, attending the Cystic Fibrosis Clinic of Winnipeg Children's Hospital, and their parents.
Methods: Psychiatric assessment was made on basis of detailed individual interviews with patient and parents. Interview technique varied with age of child and his verbal capacity. With younger children, play equipment was used to facilitate communication. Child's psychological conflicts were explored through a study of his fantasies in relation to play material, dreams, wishes, earliest memories, and drawings. Interviews with parents were child-centered, and special attention was paid to developmental milestones of the child. Emphasis was then placed on parents' marital relationships, parental attitudes in regard to child's illness, influence of child's illness on family situations, and overall adjustment of parents to each other, the child, fellow workers, neighbors, and relatives. In addition, each child was assessed by a psychologist, using three batteries of tests.
Findings: Data indicate that these children are of average or superior intelligence and that the illness causes major psychological problems both for the patient and the family group. Among the children, problems were predominantly depressive in nature. There was a high incidence of psychiatric illness among the parents which may be related to the child's illness, and which seems to have a marked destructive effect on the family unit.
Duration: Not reported-June 1967.
Investigator(s): Robert H. Lawler, M.D., Chief of Psychiatry, Winnipeg Children's Hospital, and Assistant Professor, Department of Psychiatry, University of Manitoba, Winnipeg, Manitoba, Canada.
Cooperating group(s): Department of National Health and Welfare of Canada.
Publication: The Canadian Medical Association Journal 94:1043-1046, May 14, 1966.

21-GC-4 THE EFFECTS OF CEREBRAL LESIONS IN CHILDREN ON PSYCHOLOGICAL TEST PERFORMANCE

Purpose: To discover relationships between psychological test data and known cerebral lesions; to illustrate the pattern of abilities and deficits in the child classified as having minimal brain dysfunction; and to provide normative data on a large number of abilities over the 5- to 14-year-old range.

Subjects: Children with neurological evidence of brain lesions and children with learning or perceptual problems.

Methods: Extensive neuropsychological test battery, utilizing many of the Reitan tests, is administered by test technicians. Included in the battery are tests of motor, sensory, verbal, performance, and reasoning skills. Results are punched on IBM cards and a profile printed out in standard scores by computer. Program takes into account mean and standard deviation for each of the 106 sub-test scores for each chronological age. Diagnosis of the presence and/or type of brain lesion is made on the basis of profile only.

Findings: Unique patterns of abilities and deficits have been associated with various neurological lesions and with symptoms such as seizures, hyperactivity, and dyslexia.

Duration: March 1965-1975.

Investigator(s): Robert M. Knights, Ph.D., Assistant Professor of Psychology, University of Western Ontario, London, Ontario, Canada.

Cooperating group(s): Ontario Mental Health Foundation; Children's Psychiatric Research Institute.

Publication: Research Bulletin Nos. 12 and 20, Department of Psychology, University of Western Ontario; articles planned in various psychological journals.

21-GC-5 EARLY EGO DEVELOPMENT OF CHILDREN BLIND FROM BIRTH

Purpose: To study the unique adaptive problems of infants blind from birth in the areas of human attachments, object concept, relationship to inanimate objects, gross motor development, language, and development of the sense of self.

Subjects: 12 to 15 babies.

Methods: Twice monthly home visits for observations. Film samples are recorded and analyzed for each sector of development.

Findings: In the area of prehension, there is strong evidence that grasping mode follows the biological timetable, but adaptive hand behavior, in the absence of vision, follows a unique pattern. There is no equivalence of sound for vision in constructing an object concept during first three quarters of first year. Sound does not confer substantiality to the object. An infant blind from birth does not search for or reach for an object on sound cue alone until last quarter of first year, at which time the schema of prehension and hearing are coordinated.

Duration: February 1960-June 1969.

Investigator(s): Selma Fraiberg, M.S.W., Associate Professor of Child Psychoanalysis; Ralph Gibson, Ph.D., Associate Professor of Psychology; and Marguerite Smith, Ph.D., Research Associate, Children's Psychiatric Hospital, School of Medicine, University of Michigan, Ann Arbor, Mich. 48104.

Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.

Publication: *Psychoanalytic Study of the Child*, 1967. Object concept material to be reported in 1970.

21-GC-6 MINIMAL BRAIN DYSFUNCTIONS--NEUROLOGIC SUB-CATEGORIES

Purpose: To study the intellectual, learning, physiologic, and behavioral characteristics of children diagnosed as having minimal brain dysfunction.
Subjects: 72 children with minimal brain dysfunction--24 each of hyperactive, hypoactive, and "isoactive" children. Each group is divided into three neurological groups--positive, equivocal, and negative; 24 normal children and eight children with school phobias matched as controls.
Methods: Conditioning techniques, a motor impulsivity test, and an orienting test consisting of 10 tones--9 alike and one different; during orienting test, continuous records are obtained of electrocortical activity, heart rate, skin resistance, respiration, and muscle action potentials.
Findings: The children with minimal brain dysfunction appear to be remarkably unreactive in skin resistance and, relative to normals, slow in conditioning. The unreactivity in galvanic responses may not be closely related to levels of arousal as measured by the EEG or heart rate.
Duration: June 1966-September 1969.
Investigator(s): John E. Peters, M.D., and Roscoe A. Dykman, Ph.D., Professors; Bart H. Danford, Ph.D., Assistant Professor; and Sam Clements, Ph.D., Associate Professor, Department of Psychiatry, University of Arkansas Medical Center, Little Rock, Ark. 72201.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Archives of General Psychiatry 16:281-285, 1967; manuscript also submitted to Conditional Reflex.

21-GC-7 CHILD AMPUTEES: DISABILITY OUTCOMES AND ANTECEDENTS

Purpose: To explore associations between various antecedent factors and differences in social and physical outcomes in amputees who have undergone treatment.
Subjects: Former patients of the Area Child Amputee Center, Grand Rapids, Michigan.
Methods: Sample will be surveyed 1 to 20 years after treatment. Patterns of self-care, use of health facilities, and roles of the disabled will be described. Characteristics of the patients, their social environments, treatment experiences, and organization and delivery of their care will be investigated through existing records and new reports.
Duration: Not reported.
Investigator(s): Donald C. Smith, M.D., Professor; Harold Decker, M.D., Assistant Professor; G. E. Ned Sharples, Assistant Professor; and Edward A. Duffy, Research Associate, Maternal and Child Health, Department of Health Development, University of Michigan, Ann Arbor, Mich. 48104.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-GE-1 A STUDY TO DETERMINE THOSE FACTORS WHICH MAY INTERFERE WITH EFFECTIVE HOME TREATMENT OF CHILDREN WHO HAVE RHEUMATOID ARTHRITIS, WITH IMPLICATIONS FOR IMPROVING THE INSTRUCTION AND GUIDANCE AVAILABLE TO THEIR PARENTS

Purpose: To determine how effectively parents of a selected group of children with rheumatoid arthritis have been able to carry out the treatment and appropriate home care which had been advised for their children.

Subjects: 13 children who have been treated for rheumatoid arthritis at the Children's Rheumatism Clinic at the University of Minnesota Hospitals.
Methods: Patients were thoroughly evaluated medically and functionally and an estimate made of the types of activities which should be carried out by the patient and by the patient's family in the home. An interview was conducted in the patient's home, and a brief questionnaire was mailed to the public health nurses who had visited or were currently visiting any of the children, to determine their understanding and knowledge of the effectiveness of the home treatment prescribed.
Findings: Clinic appointments were regularly kept; parents were generally satisfied with the type of instruction given and with opportunities to discuss problems with the clinical physician. Physical home environments seemed satisfactory, and continuing guidance of parents seemed indicated on a home care basis.
Duration: 1965-1966.
Investigator(s): M. Murphy, Ph.D., Professor and Director, Public Health Nursing, School of Public Health, University of Minnesota, Minneapolis, Minn. 55455.

21-GF-1 APPLICABILITY OF THE PRINCIPLES OF DYNAMIC GROUP PSYCHOTHERAPY TO THE TREATMENT OF THE ADJUSTMENT PROBLEMS OF PARENTS OF CHILDREN WITH CEREBRAL PALSY

Purpose: To evaluate effects of dynamic group psychotherapy on adjustment problems of parents of children with cerebral palsy; to test assumption that ways in which parents adjust to their child's handicap will be a function of their own psychodynamics.
Subjects: 28 applicants from total population of parents on service list of a county United Cerebral Palsy agency.
Methods: Applicants were screened to evaluate their need for and ability to utilize group therapy. Three series of weekly two-hour group therapy sessions were conducted and tape-recorded. Evaluation will focus on utilization by parents of an opportunity for self-exploration.
Findings: Meaningful utilization of the group therapy vehicle developed in ways significant in clarifying relationships between the personal psychodynamics of parents and their mode of adjustment to the physical handicap in their child.
Duration: 1963-1967.
Investigator(s): Verda Heisler, Ph.D., Clinical Psychologist in Private Practice, Westview Psychology Offices, 3636 First Ave., San Diego, Calif. 92103.
Cooperating group(s): United Cerebral Palsy of San Diego County; United Cerebral Palsy Research and Educational Foundation, Inc.
Publication: Book in preparation.

21-GG-1 PLANNING FOR A PROSPECTIVE STUDY OF HANDICAPPED CHILDREN AND ALL OTHER MEMBERS OF THE PRIMARY FAMILY UNIT

Purpose: To develop a research design and a multi-disciplinary team for a prospective study of multiply handicapped children and all members of the primary family unit.
Subjects: Handicapped children and members of the family seen at the University of Illinois Research and Educational Hospitals and the Illinois Division of Services for Crippled Children.
Methods: The design will be replicated simultaneously with multi-comparison groups of handicapped children and their families. The

primary disciplines are pediatrics, psychiatry, psychology, sociology, and education.
Duration: August 1966-July 1967.
Investigator(s): Aubrey L. Ruess, Ph.D., Project Director; Edward F. Lis, M.D., Co-Project Director; and I. M. Rosenthal, M.D., Research Pediatrician, Division of Services for Crippled Children, University of Illinois, 840 S. Wood St., Chicago, Ill.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

Mentally Retarded

21-HC-1 DEVELOPMENT OF BASIC MOTOR ABILITY TESTS FOR RETARDATES: TOWARDS A BASIS FOR SKILL TRAINING

Purpose: To develop a prototype battery of basic abilities tests for retardates by modifying existing tests of psychomotor and physical proficiency abilities; to develop "ability profiles," and explore use of such profiles in predicting trainability and performance on meaningful retardate tasks.
Subjects: 30 male retardates, ages 6 to 25, and 11 female retardates, ages 8 to 24; median age for both sexes was 13; 18 of the subjects lived at Jewish Foundation for Retarded Children, and 23 were cared for there during the day.
Methods: Three psychomotor and eight physical proficiency tests were adapted to retardate limitations. They were tests of static strength, explosive strength, extent flexibility, gross body equilibrium, dynamic flexibility, manual dexterity, reaction time, and arm-hand steadiness. Retardates were tested in groups of three, getting two scores on each test, in a fixed time period. If the subject did not respond in the time allowed, he was considered "untestable" for that trial. As an adjunct to the testing, basic subject information was collected on height, age, past I.Q. scores, housing status, sex, and American Association on Mental Deficiency etiological classification.
Findings: Retardate motor abilities may be assessed by modifying existing tests of basic motor abilities, and administering them to retardate populations; retardate performance on different tests may differentially relate to a variety of retardate characteristics such as age, sex, I.Q., housing, and etiology; and retardate "ability profiles" may be developed as predictors of task trainability and performance.
Duration: July 1966-January 1967.
Investigator(s): Edwin H. Elkin, Ph.D., Research Scientist, American Institutes for Research, 8555 - 16th St., Silver Spring, Md. 20910; and Erwin Friedman, Ph.D., Director, Jewish Foundation for Retarded Children, Inc., 6200 - 2nd St., N. W., Washington, D. C. 20011.
Publication: American Institutes for Research monograph, February 1967.

21-HC-2 THE PERCEPTION BY RETARDATES AND NORMALS OF THE NUMEROSITY OF TACHISTOSCOPICALLY PRESENTED DOT PATTERNS

Purpose: To determine the "channel capacity" of different groups of subjects (i.e., that point where more than 10 percent errors are made in correct perception of number of dots exposed for one second) on a dot perception task; also, to measure effect of varying length of presentation.

Subjects: Educable retardates, equal M.A. (nine-year-old) normals, equal C.A. (14-year-old) normals, and college students.
Methods: Dots are presented on a screen for one second. Number of dots range from 3 to 10, in random order. In one experiment, half the dots are "grouped," half are "ungrouped." In another experiment, not only number of dots, but length of presentation time will be varied.
Findings: Retardates and equal M.A. normals have a channel capacity on this task of about four or five dots, while equal C.A. normals and college students are at about six dots. Grouping of dots has no reliable effect.
Duration: January 1966-November 1967.
Investigator(s): Herman H. Spitz, Ph.D., Director of Research; David L. Hoats, M.A., and Edward A. Holden, Jr., M.A., Research Scientists, Edward R. Johnstone Training and Research Center, Bordentown, N. J. 08505.
Cooperating group(s): State of New Jersey.
Publication: Probably *American Journal of Mental Deficiency*.

21-HE-1 THE MEDIATION TRAINING OF MENTALLY RETARDED CHILDREN

Purpose: To overcome mentally retarded children's mediational deficiency by administering a learning set training program prior to introduction of the mediation task.
Subjects: Mentally retarded children with mental ages between five and eight years.
Methods: Assessment of children's mediation deficit is made by noting whether they can mediate on a paired-associates, three-stage chaining task (AB, BC, AC). Children who are unable to mediate are then administered learning set training until they reach a criterion of three perfect discriminations. The mediation task is then re-administered. A control group of non-mediators is given a series of operant tasks.
Findings: Children who received learning set training showed post-mediation relative to children who underwent operant training.
Duration: June 1966-June 1967.
Investigator(s): Ronald K. Penney, Ph.D., Professor and Acting Chairman, Department of Psychology, University of Waterloo, Waterloo, Ontario, Canada.
Cooperating group(s): Ontario Mental Health Foundation.
Publication: Probably *Journal of Experimental Psychology*.

21-HE-2 EFFECT OF SENSORY MOTOR ACTIVITY ON PERCEPTION AND LEARNING IN THE NEUROLOGICALLY HANDICAPPED CHILD

Purpose: To test the effect of sensory motor training on perception, language ability, and academic learning in children with learning disorders; to further identify types of perceptual-learning disorders and the possible differential response of each type to sensory motor training.
Subjects: 32 to 40 children.
Methods: Two classes of educationally handicapped children will be given a battery of individual tests at the beginning and end of each of two school years. Alternate classrooms serve as control groups. Sensory motor training that is basically neurophysiological is given both in classroom time and individually. Efforts will be made to enhance central nervous system's integration through hypothesized brain mechanisms. It is hoped this study will bring to the field of education that which the brain scientists have learned about how the brain functions in relation to perceptual learning.
Duration: July 1966-June 1968.

Investigator(s): A. Jean Ayres, Ph.D., Department of Education of Exceptional Children, University of Southern California, University Park, Los Angeles, Calif. 90007. (Reported by Ernest P. Willenberg, Ph.D., Director of Special Education, Los Angeles City Schools.)

21-HF-1 AUTONOMIC DYSFUNCTION IN PHENYLKETONURIA

Purpose: To determine whether the biochemical disturbances in phenylketonuria produce predictable manifestations of impairment of autonomic neurohumoral mechanisms (defective adrenergic and cholinergic outflow); also, to contrast the ability of phenylketonuric children to interact with an examiner with the ability of psychotic and normal children.
Subjects: Hospitalized psychotic, phenylketonuric, and normal children drawn from a settlement house.
Methods: Autonomic measures and patterns of pupillary dilatation and constriction will be obtained. Examination will be made of the relationship of observable behavioral symptoms of psychosis in a group of phenylketonuric children to patterns of adrenergic and cholinergic outflow, when compared with phenylketonuric children who show no such symptoms, psychotic-autistic children who do not have phenylketonuria, and normal children.
Duration: September 1966-March 1968.
Investigator(s): Ira M. Steisel, Ph.D., Chief Psychologist, St. Christopher's Hospital for Children, 2603 N. 5th St.; and Leonard S. Rubin, Ph.D., Head, Psychobiology Unit, Eastern Pennsylvania Psychiatric Institute, Henry and Abbottsford Rd., Philadelphia, Pa. 19133.
Cooperating group(s): Children's Bureau, Eastern State School and Hospital; Orthopedic Foundation of Philadelphia; National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: *Journal of Consulting Psychology*, in press, 1967.

21-HH-1 EFFECTIVENESS OF FILMSTRIPS IN TEACHING HYGIENE TO TRAINABLE SECONDARY SCHOOL STUDENTS

Purpose: To evaluate the effectiveness of 4 out of 10 filmstrips which have just been prepared by the Harris County Center for the Retarded.
Subjects: 60 trainable students, ages 14 through 18, attending the school of the Harris County Center for the Retarded.
Methods: The 60 students are distributed in four comparable classes. One class receives the filmstrip and related training, another the filmstrip only, the third, the training only, and the fourth acts as a control. Effectiveness of each method will be determined by a questionnaire to the parents.
Duration: November 1966-spring 1968.
Investigator(s): Mary Martha Thompson, Ph.D., Director of Children's Services, Harris County Center for the Retarded, 3550 W. Dallas, P.O. Box 13403, Houston, Tex. 77019.
Cooperating group(s): U. S. Department of Health, Education, and Welfare.
Publication: Results will be available with the guide book which is being prepared to accompany the filmstrips; possibly a publication.

21-HI-1 A COOPERATIVE DEMONSTRATION WORK EXPERIENCE FOR MENTALLY RETARDED ADOLESCENTS

Purpose: To demonstrate how coordinated efforts among Crossroads Rehabilitation Center, the Indianapolis Public School System, and the Indiana State Vocational Rehabilitation Division can assist students in making a more successful transition from school to the employment setting.
Subjects: 80 male and female educable mental retardates selected from public school special education classes through the use of ratings on the Milwaukee Jewish Vocational Services' rating scale for employability and appropriate psychometric data.
Methods: Subjects spend half-days in school and half-days in five basic work experience programs at Crossroads. Small group counseling activities focused on adjustment to work and development of good worker attitudes and behavior are conducted regularly. Evaluative data collected for subjects will be used to assess utilized methods. Placement and follow-up of program participants and regular special education students will permit comparisons concerning subsequent employment of adolescent retardates.
Duration: Not reported.
Investigator(s): Shelley C. Stone, Ph.D., Director of Research, Crossroads Rehabilitation Center, Inc., 3242 Sutherland Ave., Indianapolis, Ind. 46205.
Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.

21-HJ-1 TRANSITION-BUFFER UNIT FOR MENTALLY RETARDED

Purpose: To provide an intensive training area for improving the level of adjustment of those patients who show potential, and to prevent "building regression" in those patients who temporarily decompensate.
Subjects: Groups of eight ambulatory and semi-ambulatory retarded children.
Methods: Behavioral shaping methods are used which emphasize group adjustment and self-care. A multidiscipline team develops treatment programs, establishes reinforcement schedules, and evaluates the progress of the patient.
Findings: A significant reduction in "building regression" has been achieved, and several groups have been promoted to higher buildings by being trained in the Buffer Unit.
Duration: September 1965-indefinite.
Investigator(s): J. Iverson Riddle, M.D., Superintendent, and Billie B. White, R.N., Nurse Supervisor, Western Carolina Center, Morganton, N. C. 28655. (Reported by James C. White, Jr., Ph.D., Director of Psychology and Special Projects, and Coordinator, Western Carolina Center.)
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Progress reports will be sent to National Institute of Mental Health.

21-HJ-2 STUDIES OF THE STIMULUS PROPERTIES OF REINFORCEMENT

Purpose: To evaluate the discriminative and/or exciting properties of reinforcement.
Subjects: Institutionalized retarded adolescent girls, ages 11 to 16.
Methods: Stable responding is established on a Lindsley manipulandum through use of either ratio or internal reinforcement schedules. Once

stable responding is achieved, subjects are placed on extinction. When the subject's rate has decreased so that a specific pause criterion is met, reinforcement is delivered. Responses made during a one-minute post-reinforcement period are recorded and compared with a control period.
Findings: The first reinforcement during extinction results in an immediate resumption of responding. This effect ranges from transitory to rather permanent.
Investigator(s): Fred Girardeau, Ph.D., and Joseph Spradlin, Ph.D., Research Associates, Bureau of Child Research, Parsons State Hospital and Training Center, Parsons, Kans. 67357.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Work will be published in the Journal of Experimental Child Psychology and the American Journal of Mental Deficiency.

21-HJ-3 RESIDENTIAL UNIT CARE PLAN FOR RETARDED CHILDREN

Purpose: To provide personalized nursing care to 50 mentally retarded children under five years of age.
Subjects: 50 mentally retarded pre-school children in residence at Newark State School.
Methods: Individualized care of these retardates is accomplished by an increase in staffing on this unit, with one attendant or nurse assigned to four to six children on a continuing basis. The attendant administers comprehensive nursing care with emphasis on assisting the child to learn self-care skills. The child care worker seeks to meet not only the young retardate's physical needs, but his social, emotional, and spiritual needs as well.
Findings: Children are responding to this special type of nursing care. For example, children who were crib patients and did not react to those about them are now placed on mats, sitting in chairs, or using walkers. These young children also react by a smile or extending their arms to the attendant or nurse who cares for them. Certain children are gradually gaining some degree of independence in mastering the simple skills of activities of daily living.
Duration: October 1966-May 1971.
Investigator(s): Frank R. Henné, M.D., Director, Newark State School, 529 Church St., Newark, N. Y. 14513.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: No plans for publication at present time.

21-HJ-4 USE OF VOLUNTEERS AS TRAINERS OF RETARDED CHILDREN

Purpose: To train volunteers in specialized positions formerly held by highly trained professionals; to demonstrate methods of recruiting, selecting, training, and supervising sub-professionals as extensions of regular professional staff; and to evaluate effects on volunteers and retardates.
Subjects: Volunteers of varied educational and socio-economic levels, ages 17 to 70.
Methods: Volunteers are recruited through existing volunteer services at Austin State School. They are trained through workshops and individual counseling, and are assigned to one of four specialized programs working with retarded children. Indices of change will be analyzed in the overall volunteer program, in individual volunteers, and in retardates.

Duration: March 1966-December 1968.
Investigator(s): Philip Roos, Ph.D., Superintendent, Austin State School, P.O. Box 1269, Austin, Tex. 78767.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Several articles have been submitted for publication; others in preparation.

21-HJ-5 A DEVELOPMENTAL PROGRAM FOR THE SEVERELY RETARDED

Purpose: To provide an enrichment experience for severely and profoundly retarded children in the areas of self-help, social, motor, and language skills.
Subjects: 135 severely and profoundly retarded residents with a mean age of 9.8.
Methods: Baseline measurements are taken on a Behavioral Rating Scale especially developed for this program, and children are divided into groups consistent with their developmental abilities. Behavioral modification techniques are used, treating desired behaviors as operants which are approximated and differentially positively reinforced. This is done in conjunction with demonstration and facilitating imitative behaviors. For children of profound retardation, particularly with multiple handicaps, a sensory program has been instituted consisting of kinesthetic, auditory, visual, olfactory, and gustatory stimulation. Passive and active exercises to facilitate developmental crawling are being used. In addition, various new techniques are utilized by attendant personnel.
Findings: Considerable improvement in some children and some degree of improvement in most of the children.
Duration: February 1966-January 1971.
Investigator(s): Gareth D. Thorne, M.A., Superintendent, Arizona Children's Colony, P.O. Box 1467, Coolidge, Ariz. 85228.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Articles planned; annual reports will cover relevant information such as method, results, and discussion of findings.

21-HJ-6 CHANGES IN THE LEVEL OF FUNCTIONING OF MENTALLY RETARDED CHILDREN AND THEIR FAMILIES MEASURED AT THE POINT OF ENTRY INTO HOSPITAL AND ONE YEAR LATER: A STUDY OF CHILDREN ADMITTED FROM METROPOLITAN TORONTO TO THE ONTARIO HOSPITAL SCHOOL, ORILLIA, IN ONE YEAR

Purpose: To describe the characteristics of all the children admitted to a long-term residential institution for retardates (Ontario Hospital School, Orillia) from metropolitan Toronto for a period of one year and the characteristics of their families; to measure intellectual and social changes in these individuals over time; to measure changes in the family functioning over time; to relate institutionalized subject changes to characteristics of their families; and to relate family functioning changes to subject characteristics.
Subjects: 120 children admitted to the Ontario Hospital School, Orillia, between April 1965 and June 1966 and their families, and a contrast group consisting of 40 children matched with the test group for age, mental ability, sex, and mongolism, and their families.
Methods: Family interviews are conducted, children are administered psychological tests, and records and reports are obtained from other agencies and medical sources.

Duration: April 1965-April 1968.
Investigator(s): J. B. Fotheringham, M.D., Clinical Director, Mental Retardation Center, 2 Surrey Place, Toronto, Ontario, Canada.
Cooperating group(s): Ontario Mental Health Foundation.
Publication: Publications planned in appropriate journals.

21-HK-1 FAMILY THERAPY WITH PARENTS OF RETARDED ADOLESCENTS AND GROUP THERAPY WITH ADOLESCENT RETARDATES THEMSELVES

Purpose: To change family rejection of retarded adolescents to a positive and constructive relationship; to enable adolescents to apply themselves to tasks and become self-supporting.
Subjects: Retarded adolescents, parents, and siblings.
Methods: Therapy sessions with parents; siblings included at times. Separate group sessions are held with adolescents.
Findings: Girls showed growth and maturity, achieved greater freedom to acquire skills, increased emotional control, and greater sociability.
Duration: 1965-August 1966.
Investigator(s): Gusta P. Thaun, Ph.D., Private Practice, 231 E. 76th St., New York 10021; and Queens County Neuropsychiatric Institute, 37-64 72nd St., Jackson Heights, N. Y. 11372.
Publication: Reported as part of panel discussion on retardation, International Congress on Adolescence, University of Edinburgh, Summer 1966.

Emotionally Disturbed and Mentally Ill

21-JA-1 IDENTIFICATION OF EMOTIONAL DISTURBANCE IN CHILDREN

Purpose: To study whether clinical psychologists can discriminate "blindly" between emotionally disturbed children and matched normal controls; to gather objective norms by which to differentiate between experimental and control groups.
Subjects: 100 boys and girls selected by teachers, public health nurse, and pediatrician as having signs of emotional disturbance; 100 matched control children with no signs of emotional disturbance.
Methods: Children are evaluated through a standard test battery, including DAP, Peabody, Frostig, ITPA, WRAT, WISC, Rorschach, and Missouri Children Picture Series.
Duration: September 1966-June 1967.
Investigator(s): Luciano L'Abate, Ph.D., Professor of Psychology, Georgia State College, 33 Gilmer St., S.E., Atlanta, Ga. 30303.
Cooperating group(s): School health personnel; Georgia Health Department.
Publication: Submitted to professional journals.

21-JB-1 CHILD PSYCHIATRIC EMERGENCIES: CLINICAL CHARACTERISTICS AND FOLLOW-UPS

Purpose: To examine demographic and clinical data of child psychiatric emergencies and to compare them to similar data of a control group of emotionally disturbed children referred for child psychiatry service but considered non-emergencies; to assess results of emergency evaluations in terms of diagnosis, disposition, and outcome of recommended action.

Subjects: The 170 emergency cases seen at the Child Psychiatry Clinic of University Hospitals, Cleveland, during a recent two-year period, and a control group of 170 children randomly selected from regular clinic referrals during same period of time.
Methods: Records of emergency and non-emergency referrals were examined and compared in terms of demographic characteristics, referral source, symptomatology, duration of illness, diagnostic impression, and recommendation. Agencies and hospitals involved in caring for the child and his family following the emergency evaluation provided follow-up information. Most families who had failed to follow through with recommendations could be interviewed regarding present functioning of their child.
Findings: Comparison of data from emergency and control groups revealed some significant differences: 80 percent of the emergencies were adolescents (ages 12 to 17), while 45 percent of the controls were in the same age range. Boys made up one-third of the emergencies; girls, two-thirds. These proportions were reversed in the control group. Acute mental symptoms (e.g., suicidal behavior, psychotic manifestations, school refusal, aggressive outbursts) were more common among the emergencies. The latter, however, showed as much evidence of underlying, chronic individual and family maladjustments as did the control group. Suicidal attempts or threats had prompted close to half of all emergency calls with a ratio of three females to one male, 30 percent of the emergencies were hospitalized immediately, while 54 percent were referred for further outpatient study. Analysis of follow-up data revealed that in the emergency group there was only a minority of basically healthy children with acute emotional symptoms where the therapeutic intervention seemed truly preventive.
Duration: July 1965-December 1966.
Investigator(s): Ake Mattsson, M.D., Instructor in Child Psychiatry, and James W. Hawkins, M.D. Candidate, Western Reserve University School of Medicine, Cleveland, Ohio 44106.
Publication: Paper for psychiatric journal in preparation.

21-JB-2 THE PRE-HOSPITAL LEISURE TIME ACTIVITIES OF MENTAL PATIENTS

Purpose: To develop an instrument for obtaining from the patient and other sources data about his leisure activities and participation in voluntary organizations before hospitalization; to determine how this information can be used in program planning adapted to the individual patient during and after hospitalization; and to ascertain the relationship of social class and other demographic variables to the leisure activities and organizational participation of hospital clientele.
Subjects: Child, adolescent, and adult patients receiving rehabilitation services in a state mental hospital, and patients in similar age categories not receiving such services.
Methods: Demographic and diagnostic data are obtained from patient records, and patients are interviewed regarding their pre-hospital leisure activities and preferences and participation in voluntary organizations. The social position of each patient is determined according to the Hollingshead Two-factor Index of Social Position, and patients receiving rehabilitation services are compared with patients of similar age and sex who are not receiving rehabilitation.
Duration: July 1966-June 1967.
Investigator(s): Irving Babow, Ph.D., Research Social Scientist; Bessie Clark, O.T., Chief, Rehabilitation Department; and Alonza C. Johnson, M.D., Chief, Research Department, Napa State Hospital, Imola, Calif. 94558.
Publication: Publication is planned in a psychiatric journal and a rehabilitation journal. A copy of the report will also be available from the Research Department, Napa State Hospital.

21-JB-3 DESCRIPTION OF THE PERSONALITY STRUCTURE OF THE EMOTIONALLY DISTURBED CHILD IN TERMS OF PERFORMANCE TESTS AND QUESTIONNAIRES

Purpose: To replicate earlier findings with a similar age group; to identify personality dimensions that discriminate between "normal" children, clinic children, and children (judged emotionally disturbed) in institutions.
Subjects: 230 12-year-old children, 100 of whom are in institutions or clinics.
Methods: Performance tests and questionnaires; factor analysis, factor extension analysis, and analysis of subjects into groups.
Findings: Four factors, apart from intelligence, show marked association with criteria.
Duration: 1964-1967.
Investigator(s): John D. Hundleby, Ph.D., Associate Professor of Psychology, New York University, New York, N. Y. 10003.
Cooperating group(s): City College Research Fund; Arts and Science Research Fund, New York University; National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Monograph planned.

21-JB-4 RECIPROCITY AND COERCION: TWO FACETS OF SOCIAL INTERACTION

Purpose: To investigate social interaction within the framework of social learning procedures (reinforcement and modeling); particularly, to relate variations in reciprocity and coercion to the formation of deviant behaviors in children.
Subjects: Families referred to outpatient facilities because of problems with deviant children.
Methods: Observation and behavior modification procedures introduced into the home.
Findings: There are very high correlations among members of a family in terms of getting and receiving positive social reinforcements. The persons within the family (as a social system) who give the highest ratio of positive social reinforcers also receive the highest ratio of reinforcement. This kind of reciprocity does not hold for adverse consequences.
Duration: January 1967-not reported.
Investigator(s): Gerald R. Patterson, Ph.D., Professor of Psychology, University of Oregon, Eugene, Ore.
Publication: Chapter in preparation for book. J. Michels and R. Neurigner (Eds.). McGraw Hill, 1968.

21-JC-1 ADULT ADJUSTMENT OF ADOLESCENT PATIENT GROUPS

Purpose: (1) To compare the relative contribution psychiatrically disturbed adolescents and their non-disturbed patient peers make to positive adult mental health; (2) to determine extent to which adolescent levels of disturbance contribute to adult mental health; (3) to determine relationship of demographic variables of adolescent psychiatric and non-psychiatric patient groups to adult mental health; and (4) to assess significance of adolescent interpersonal relationships (parent-child, sibling, peer, and parent-parent) to adult mental health.
Subjects: 800 white male and female former adolescent psychiatric patients and 200 non-psychiatrically disturbed patient peers. Patients were 13 through 17 years of age at some time in the period of 1938 to 1950 when they were seen at the University of Minnesota Medical Center.

Methods: Subjects will be individually interviewed using a structured interview and given the Minnesota Multiphasic Personality Inventory. Public records will provide another source of information with which to categorize the subjects according to a five-point rating scale of mental health. Medical records will provide data for determining adolescent adjustment.
Duration: June 1966-August 1970.
Investigator(s): A. Jack Hafner, Ph.D., and Wentworth Quast, Ph.D., Associate Professors, Division of Clinical Psychology, University of Minnesota, Minneapolis, Minn. 55455.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

21-JC-2 EARLY BEHAVIOR PROBLEMS AND LATER REFERRAL FOR MENTAL HEALTH SERVICES

Purpose: To study the relationship of four dimensions of problem behavior (conduct problems, personality problems, inadequacy-immaturity, and socialized delinquency) in kindergarten and first grade children to later referral for mental health services and to socio-economic and school achievement variables.
Subjects: Approximately 4,000 kindergarten and first grade children, 2,000 of whom will be studied at both kindergarten and first grade levels.
Methods: Each child is rated by his teacher near the end of the school year on a problem behavior checklist yielding scores on the four previously noted factor analytically derived dimensions. Scores will be related to criterion variables during course of children's elementary school attendance.
Duration: May 1965-continuing.
Investigator(s): Herbert C. Quay, Ph.D., Research Director, Children's Research Center, and Professor of Psychology, and John S. Werry, M.D., Research Child Psychiatrist, Children's Research Center, and Assistant Professor of Psychiatry, Department of Psychology, University of Illinois, Urbana, Ill. 61801.
Cooperating group(s): Urbana (Ill.) Public Schools; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Journal articles planned.

21-JC-3 THE "THERAPEUTIC" EFFORTS OF EVALUATION PROCEDURES IN A CHILD PSYCHIATRIC CLINIC

Purpose: To assess and make explicit the behavioral variables most subject to "change" following routine intake-evaluation procedures.
Subjects: 50 children referred for psychiatric evaluation to the Division of Child Psychiatry, University of Texas Medical Branch.
Methods: Upon referral to the clinic, the parents of children for whom service is sought are sent a 69-item problem behavior rating scale, to be completed on the basis of the referred child's behavior. When the completed rating scale has been returned to the clinic, the child is given an appointment for a full day's evaluation. (The interval between mailing the blank rating scale and the day of evaluation has been found to be rather constant.) The parents of half the children's group are asked, on the morning of the evaluation, to complete, again, a copy of the behavior rating scale. The parents of the other half of the subject group are required to fill out the scale in the afternoon of the intake day, following the final (feedback) interview with the diagnostic team. Children's rated behavior for both groups is then compared with

the initial ratings. The expectation is that the group whose parents received feedback will show a greater decrease in problem behavior than the control group.
Duration: February 1967-1968.
Investigator(s): Willy A. Kouw, Ph.D., Assistant Professor, and Cherrie L. Wood, Research Assistant, Department of Neurology and Psychiatry, University of Texas Medical Branch, Galveston, Tex. 77550.
Publication: Article planned in *Journal of the American Academy of Child Psychiatry*.

21-JD-1 ALOPECIA AREATA STUDY

Purpose: To define the relationship, if any, between alopecia areata (and alopecia totalis) and emotional factors.
Subjects: Children up to age 18, diagnosed in the Dermatology Section of the Outpatient Department of Children's Hospital as having alopecia.
Methods: Detailed psychiatric evaluation.
Findings: There is relatively convincing evidence of an association of pre-genital factors with the course and outbreak, varying according to the developmental level.
Duration: 1964-1967.
Investigator(s): Robert D. Mehlman, M.D., Assistant in Psychiatry, Children's Hospital Medical Center and Harvard Medical School, and Senior Psychiatrist, Massachusetts Mental Health Center; and Robert D. Griesemer, M.D., Assistant Professor of Dermatology, Harvard Medical School, Associate in Dermatology, Children's Hospital Medical Center, and Senior Associate in Medicine (Dermatology), Peter Bent Brigham Hospital, Boston, Mass. 02115.
Publication: Report of clinical findings to be published.

21-JE-1 PSYCHOPHYSIOLOGICAL STUDIES OF AUTISTIC CHILDREN

Purpose: To investigate orienting behavior and habituation of orienting behavior to simple sensory stimuli; to evaluate effects of a period of operant training designed to establish social and language behaviors upon measures of orienting; and to analyze background brain wave activity in children with early infantile autism. Measures of the orienting response will be the galvanic skin response, heart rate changes, and the EEG arousal response.
Subjects: 20 children diagnosed as having early infantile autism, and 20 normal children matched for age and sex.
Methods: Visual and auditory stimuli will be used in the habituation procedure. The visual stimulus will be a pure tone. Background EEG data will be collected, and the habituation procedure will be run. This procedure will consist of presenting the habituation stimulus until occurrence of three consecutive non-responses, then changing to a novel stimulus of the same sensory channel. The order of each of the types of sensory stimuli will be counterbalanced so that half the subjects in each group will receive the auditory condition first and the other half will receive the visual condition first. Habituation data will be again obtained after autistic subjects develop language and social behaviors as a function of operant training.
Findings: Pilot data from a few autistic children suggest that, in terms of the GSR measure, these children are more reactive than normal children and are less able to maintain habituation over time. Some autistic children may have no response at all; however, this is not an unusual finding, since some proportion of normals do not have GSR's.

Duration: February 1966-February 1968.
Investigator(s): Martha E. Bernal, Ph.D., Assistant Professor of Medical Psychology; James Q. Simmons, III, M.D., Assistant Professor, and Chief, Children's Inpatient Service; and Paul Naitoh, Ph.D., U. S. Public Health Service Post-Doctoral Trainee, Department of Psychiatry, Neuropsychiatric Institute, University of California, Los Angeles, Calif. 90024.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Publication is planned when research is completed.

21-JE-2 EXPERIMENTAL APPROACH IN THE TREATMENT OF AUTISM

Purpose: To study possible etiologic applications and a specific kind of treatment in children using autistic defenses.
Subjects: Children with autistic defenses under the age of 10.
Methods: Individual children are placed in a room remodeled to provide a sensory deprivation experience. Although constant monitoring by the staff goes on, twice daily contact with the child's therapist also takes place. During the time when the stimulus hunger occurs, the therapist is available for contact.
Findings: Two children, one kept in the deprivation room for 68 days and the other for 40 days, have, after a year following the experimental procedure, maintained close contact with people in their environment. Autistic defenses in the main seem to have been interrupted, and both the children are attempting to speak.
Duration: November 1965-indefinite.
Investigator(s): Marshall D. Schechter, M.D., Professor of Child Psychiatry, and Povl W. Toussieng, M.D., Associate Professor of Child Psychiatry, University of Oklahoma Medical Center, 800 Northeast 13th St., Oklahoma City 73104; and Jay T. Shurley, M.D., Research Professor of Psychiatry, Veterans Administration Hospital, Oklahoma City, Okla.
Cooperating group(s): Clinical Research Center, University Hospital, Oklahoma City.
Publication: Submitted for publication.

21-JF-1 PARENT-CHILD INTERACTION WITH SCHIZOPHRENIC CHILDREN

Purpose: To determine stimulation and interaction patterns of schizophrenic children and their parents; to test hypothesis that for these children there is a breakdown in the reciprocal stimulation in these families and responsiveness resulting in the parents', especially mothers', increased withdrawal and insensitivity to their children.
Subjects: 30 psychotic children, 30 brain-damaged children, and 30 normal nursery school children, ages three to six, and their parents.
Methods: Each family is observed in interaction on three separate occasions. Parents are given seven tasks to perform with their child while two observers take running notes behind a one-way mirror. Interaction is rated on six special rating scales. A social history is obtained from the families, and parents and children are interviewed and tested. Ratings are statistically analyzed, and scales and measures for comparing responses to projective tests have been evolved.
Findings: Parents of psychotics show significantly less sensitivity to their psychotic children. Their behavior is marked by stereotypy and rigidity. Affectively, they withdraw and fail to respond to cues emitted by the child.
Duration: December 1965-November 1968.

1068

Investigator(s): Ralph Rothstein, Ph.D., Director of Psychology Training, Worcester Youth Guidance Center, 275 Belmont St., Worcester, Mass. 01604.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Papers presented to Midwestern Psychological Association, May 1966, and Eastern Psychological Association, April 1967.

21-JG-1 FAMILY INTERACTION AND DEVIANT BEHAVIOR

Purpose: To study family interaction correlates of child deviant behavior in families in which there is, respectively, an aggressive, withdrawn, or non-deviant male or female child between ages 9 and 11; specifically, to attempt limited experimental modification of family interaction thought to be related to child deviant behavior.
Subjects: 360 families corresponding to following child characteristics: 20 male and 20 female children in each of the three trait groups described above and at each age level (9, 10, and 11).
Methods: Parents are rated on a semi-structured interview. A standard three-way interaction assessment procedure will also be given to father, mother, and child. Experimental attempts of modification will focus on interrupting sequences of blaming-counter-blaming behavior and on increasing assertive behavior in the withdrawn child.
Duration: May 1966-June 1969.
Investigator(s): Barclay Martin, Ph.D., Professor of Psychology, and E. Mavis Hetherington, Ph.D., Associate Professor of Psychology, University of Wisconsin, Madison, Wis. 53706.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Journal articles planned; possibly a book.

21-JG-2 PARENTAL EXPECTATIONS AND THE RESULTS OF PSYCHOLOGICAL SERVICES TO CHILDREN

Purpose: To investigate congruency between what parents expect of services rendered to them and their child by clinical psychologists and services actually rendered; to assess results of services from point of view of parents' perceptions and reported concerns about the children's "symptoms."
Subjects: Parents and children in the caseload of a clinical psychologist in private practice.
Methods: Parents are asked to rank seven expectations in order of their importance to them. This will be done when they apply for service and at termination. Each parent ranks items separately. Parents are given a checklist of children's behaviors and asked to indicate those about which they are worried and the intensity of their worry. This list will be used at application, termination, and six-month follow-up.
Duration: June 1966-indefinite.
Investigator(s): Martin R. Gluck, Ph.D., Associate Professor of Psychology, University of Texas Southwestern Medical School; and Wirt M. Wolf, Ph.D., Private Practice, Dallas, Tex. 75235.
Publication: Journal publication planned.

21-JG-3 RELATIONSHIPS BETWEEN PARENTAL ATTITUDES AND BEHAVIOR

Purpose: To explore relationships between parental attitudes as measured by a questionnaire and observed behavior of parents' interaction with an adolescent son. Using the Leary system of interpersonal analysis, wherein behavior is divided into a circular continuum of eight general categories having a systematic relationship among them, we hypothesized a close, positive relationship between specific attitudes and corresponding kinds of behavior on the circular continuum, with relationships becoming increasingly discrepant as they become further removed from the relevant behavior.
Subjects: 26 mothers and 26 fathers and their adolescent sons, referred for psychiatric treatment because of severe underachievement or behavior problems.
Methods: Measures of parental attitudes were obtained from the Parental Attitude Research Instrument. Concern was with three factors: authoritarian-control, democratic, and hostile-rejection. Families were also observed in a small room through a one-way mirror while they answered a questionnaire designed to stimulate family discussion. Interactions were observed, tape recorded, and subsequently coded according to Leary's categories. Data were analyzed by comparing each attitude factor to the eight behavior categories of both mothers' and fathers' groups by means of rank difference correlations. The obtained correlations for each attitude factor for both parent groups were then ranked from highest to lowest and compared to expected ranks according to expected behavioral trends.
Findings: Two of the attitude factors for fathers--democratic and hostile-rejection--followed the predicted behavioral trend. The democratic correlation was significant at the .05 level; the hostile-rejection correlation approached significance. The democratic correlation for the mothers followed the predicted trend but was not significant; the hostile-rejection correlation for the mothers was neutral. The authoritarian-control correlations for both fathers and mothers were in the opposite direction from that predicted.
Duration: 1965-1967.
Investigator(s): Fortune V. Mannino, Ph.D., Project Director, and Exall L. Kimbro, Jr., M.D., Chief, Clinical Research and Program Evaluation Section, Mental Health Study Center, National Institute of Mental Health, 2340 University Blvd. E., Adelphi 20783; Barbara Morgenstern, M.A., School Psychologist, Board of Education, Prince George's County, Md.; and Julia Kisielewski, M.A., Social Science Analyst, University Research Corporation, Washington, D. C.
Publication: Journal publication is planned.

21-JG-4 THE EFFECT OF THERAPIST VARIABLES ON CHILDHOOD ADJUSTMENT AS A FUNCTION OF WORK WITH PRE-INTAKE PARENT COUNSELING GROUPS

Purpose: To test the social learning theoretical proposition that effective therapists provide parents with models for facilitative human relationships, that parents then offer such enhanced growth-promoting conditions to their children, and that the children in turn learn to function more effectively on the same relationship dimensions in their human encounters; to study the potential of working with pre-intake counseling groups in order to offer an effective service to a greater number of people.
Subjects: Parents of emotionally disturbed children who have applied to a child guidance clinic for help.
Methods: Levels of accurate empathic understanding, respect, genuineness, and concrete discussion offered by several different therapists in short-term parent counseling groups are rated from tape recorded excerpts. Levels of parental functioning on these dimensions are determined from

ratings of tape recorded counseling group excerpts as well as from a relationship inventory. Changes in child functioning are assessed from before and after personality testing of the child, as well as from parental and teacher ratings.
Duration: October 1966-October 1967.
Investigator(s): David Donofrio (Ph.D. Candidate, State University of New York at Buffalo), Intern Psychologist, The Psychiatric Clinic, Inc., Central Park Plaza, Buffalo, N. Y. 14214. (Reported by Ralph Bierman, Ph.D., Director of Research, The Psychiatric Clinic, Inc.)
Publication: Publication planned.

21-JG-5 INDICATIONS AND COUNTER-INDICATIONS FOR THERAPEUTIC INTERVENTION IN THE PRE-NURSERY VIA THE MOTHER

Purpose: To establish criteria for selecting mother-child dyads favorable for therapeutic intervention via the mother for children under three.
Subjects: Two mother-child dyads (first stage) to be followed by other pairs.
Methods: Two-to-three-year-olds and their mothers are observed by participant and non-participant observers in a pre-nursery; group guidance sessions are conducted with the mothers; and assessment is made of change in presenting symptoms of child by team of investigator, pre-nursery teacher, and group therapist.
Duration: 1965-indefinite.
Investigator(s): Augusta Alpert, Ph.D., Associate Director, Child Development Center, 120 W. 57th St., New York, N. Y. 10019.
Publication: The Psychoanalytic Study of the Child, November 1967, in press.

21-JG-6 JANE WAYLAND CHILD CENTER DAY TREATMENT PROGRAM

Purpose: To conduct a program for disturbed children who have been excluded from public schools because of their behavior; to develop measurements to evaluate results; to develop cooperative teaching-therapy techniques applicable to regular educational programs; and to evaluate the effectiveness of including parents, on a mandatory basis, in the therapy program.
Subjects: Emotionally disturbed children, ages 7-1/2 to 12.
Methods: School is in session for eight hours a day, eleven months a year. Classrooms have special education teachers. Each child has a prescribed program of education and therapy evolved by the mental health staff of the Center and the teachers. The children are seen individually for psychotherapy twice a week, and parents receive individual or group therapy weekly.
Findings: Significant differences are evident between the various subgroups: (1) children in therapy and the day-treatment program and their parents in treatment, (2) children and parents in treatment, (3) children only in treatment, and (4) parents only in treatment. Also, it has been found that (1) a high proportion of emotionally disturbed children have cerebral dysfunctions. This is not seen on psychological tests, or neurological or psychiatric examinations because of the overwhelming impact of the emotional disturbance; such organicity, however, becomes apparent after the child improves in treatment, (2) the structuring of physical space can be a highly effective adjunct to milieu therapy, and (3) treating of the children without a concomitant treatment of parents may be a waste of time.
Duration: 1964-August 1967.

Investigator(s): Francis A. Enos, Ph.D., Chief Clinical Psychologist, Jane Wayland Child Center, 1937 West Jefferson, Phoenix, Ariz. 85009.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

21-JH-1 PSYCHOPHARMACOLOGICAL STUDIES IN CHILDREN

Purpose: To study the effects of certain compounds on behavioral symptomatology of children.
Subjects: 50 or more children, ages 5 to 16, with varied behavioral problems.
Methods: Appropriate baseline studies are done. The child then takes, in a double-blind procedure, an agent for two to three weeks. Detailed observations are made and the basic studies repeated after each trial.
Duration: 1965-1966.
Investigator(s): Irvin A. Kraft, M.D., Associate Professor of Psychiatry and Pediatrics, Baylor University College of Medicine, and Medical Director, Texas Institute of Child Psychiatry, and Cahit Ardali, M.D., Clinical Instructor, Baylor University College of Medicine, and Project Director, Texas Institute of Child Psychiatry, Houston, Tex. 77025.

21-JH-2 MEASURE OF CHANGE IN MENTAL HEALTH STATUS OF CHILDREN

Purpose: To test the sensitivity and validity of a method for making clinical inferences from behavioral data. The behavioral and clinical instruments and the procedures for relating the two are designed to evaluate effectiveness of various types of intervention, especially through psychotherapy, with emotionally disturbed children.
Subjects: Ten latency children undergoing psychotherapy twice a week.
Methods: Cases assessed at intake and one year later. A 237-item Deviant Behavior Inventory is filled out by research team from five sources: mother, father, teacher, school observer, and home observer. Psychiatrists make clinical evaluation along Clinical Assessment Outline, on basis of configurations of behaviors. Agreement among judges is measured.
Findings: Meaningful clinical assessments of mental health status and of changes in it are practicable, reliable and, as far as can be determined, valid. Criteria of evaluation can be specified and behavioral signs observed. The process of intrapsychic change can be explored and hypotheses formulated and tested.
Duration: January 1965-February 1967.
Investigator(s): Eva Rosenfeld, Ph.D., Project Director, Jewish Board of Guardians, 120 W. 57th St., New York, N. Y. 10019. (Reported by Donald M. Feldman, Administrative Assistant, Jewish Board of Guardians.)
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Book to be published in 1968.

21-JH-3 THE TEXAS ANIMAL CARTOON OBSERVATION SERIES (TACOS)

Purpose: To relate an unambiguous patient-response (dichotomous preferential sorting of animal cartoons) to observed behavior and factual data concerning the child's age, sex, birth order, sibling order, adoptive status, and clinical diagnosis.

Subjects: 70 children referred to Division of Child Psychiatry, University of Texas Medical Branch; 90 children sampled from the Galveston Independent School District; 20 of the children demonstrate reading disorders in the absence of manifestations of emotional disturbance.
Methods: Pilot study aimed at initial development of cartoons, assessing their discriminatory properties, and arriving at empirically based hypotheses concerning cartoon sortings and their relationships to reported behavior and factual information.
Duration: January 1966-1968.
Investigator(s): Willy A. Kouw, Ph.D., Assistant Professor, Department of Neurology and Psychiatry, University of Texas Medical Branch, Galveston, Tex. 77550.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Submitted to Journal of the American Academy of Child Psychiatry.

21-JH-4 CARTOON SORTING BY THERAPISTS AND THEIR PATIENTS AS A NON-VERBAL INDEX OF "UNDERSTANDING"

Purpose: To explore levels of agreement on a standard behavioral variable (TACOS sortings) between child psychiatric patients and their therapists.
Subjects: Psychotherapists of varying levels of experience select patients whom they "know very well," "know somewhat," and "don't know."
Methods: Therapists do TACOS sortings for each child patient with the instructions to sort the cartoons as they believe their patients will. Therapists' sortings are then compared with sortings actually done by the children. Amount of agreement between therapist's and child's sorting is considered to be an operational definition of "understanding" and is hypothesized to vary with therapist's experience and knowledge of the child and potentially as an index of improvement in psychotherapy.
Duration: April 1967-1968.
Investigator(s): Willy A. Kouw, Ph.D., Assistant Professor, Department of Neurology and Psychiatry, and Henry L. Burks, M.D., Associate Professor and Chief, Division of Child Psychiatry, University of Texas Medical Branch, Galveston, Tex. 77550.
Publication: Articles planned in child psychiatry journals.

21-JH-5 NIACINAMIDE AND ITS EFFECTS IN MODIFYING THE COURSE OF CHILDHOOD SCHIZOPHRENIA

Purpose: To ascertain the validity of claims of the beneficial therapeutic effects of niacinamide on the course of childhood schizophrenia, and to attempt to duplicate the procedure for obtaining the "mauve factor."
Subjects: A population of at least 60 children with childhood schizophrenia, under age 12.
Methods: A double-blind study, with two groups randomly chosen, one receiving niacinamide and the other a placebo. Psychological and clinical investigations were utilized to screen the subjects and are being used with ratings to follow the progress of the children. Initial urine testing for "mauve factor" has been carried out.
Findings: All urine specimens tested have failed to reveal a "mauve factor" in our subjects.
Duration: December 1966-December 1967.

Investigator(s): W. A. Hawke, M.D., Chief, Department of Psychiatry; G. H. C. Greenbaum, M.D., Consultant in Child Psychiatry and Clinical Assistant; and M. Havelkova, M.D., Staff Psychiatrist, The Hospital for Sick Children, 555 University Ave., Toronto, Ontario, Canada.
Cooperating group(s): West End Crèche, Toronto; Ontario Mental Health Foundation.
Publication: Publication planned.

21-JH-6 A DEMONSTRATION AND RESEARCH PROJECT TO ESTABLISH PRE-PLACEMENT TREATMENT SERVICES FOR CHILDREN ACCEPTED FOR RESIDENTIAL TREATMENT, AND THEIR FAMILIES

Purpose: To demonstrate the effectiveness of pre-placement treatment services in preventing or shortening institutional care; to compare the use of placement made by the group of children and families served by the project with the use of placement made by a similar group not enrolled in the project; to determine the extent to which a program geared to working intensively with the families and community agencies can meet the therapeutic, social, and educational needs of emotionally disturbed children for whom residential treatment has been recommended; to measure validity of assessment of family strengths and weaknesses as presently made by the Admissions Committee of Children's Village.
Subjects: 12 boys accepted for residential treatment, and their families.
Duration: January 1966-January 1967.
Investigator(s): Mary F. Clancy, M.S.W., Director, Casework Services, Children's Village, Dobbs Ferry, N. Y. (Reported by NCCD. See Note, p. 73.)
Cooperating group(s): Federation of Protestant Welfare Agencies.

21-JH-7 MAGNESIUM PEMOLINE WITH EMOTIONALLY DISTURBED BOYS

Purpose: To determine the effect of magnesium pemoline on the learning abilities and energy levels of emotionally disturbed boys.
Subjects: 60 eight-year-old boys clinically diagnosed as slightly and moderately disturbed.
Methods: A double-blind study is conducted in which children are evaluated clinically, measured with activity room test to establish activity levels before and after administration of the drug, and given pre- and post-tests, including learning, OMR, FSP, etc.
Duration: March 1967-June 1968.
Investigator(s): Irvin A. Kraft, M.D., Associate Professor of Psychiatry and Pediatrics, Baylor University College of Medicine, and Medical Director, Texas Institute of Child Psychiatry; and Cahit Ardali, M.D., Clinical Instructor of Psychiatry and Pediatrics, Baylor University College of Medicine, and Project Director, Texas Institute of Child Psychiatry, Houston, Tex. 77025.
Cooperating group(s): Abbott Drug Company.
Publication: Publication planned upon completion.

21-JI-1 THERAPEUTIC EDUCATIONAL PROGRAM FOR CHILDREN

Purpose: To study effects of specially designed study programs in a therapeutic orientation on emotionally disturbed children.
Subjects: Children in the New Hampshire Hospital children's units.

Methods: Individualized special education methods; situational therapy, and individual or group therapy.
Duration: September 1966-June 1969.
Investigator(s): G. Donald Niswander, M.D., Director of Research and Education, and Cornelius J. Coco, M.A., Senior Psychologist, Therapeutic Education Program, New Hampshire Hospital, 105 Pleasant St., Concord, N. H. 03301.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Yearly and final reports to National Institute of Mental Health.

21-JI-2 PROGRAMMED TRAINING AND PLACEMENT FOR NON-PSYCHOTIC BEHAVIORALLY DISTURBED ADOLESCENTS

Purpose: To utilize methods of programmed interaction re-training as basis for new type of personal adjustment training.
Subjects: Male adolescent primary behavior disorder patients, age 15 and over.
Methods: Supervisory behavior patterns in a sheltered workshop are programmed to expose each boy to the kinds of stress he may encounter in industrial employment, parallel to and integrated with those he learns to manage in individualized training sessions. Vocational evaluation and personal adjustment plan based on skills, interests, measures of behavioral vulnerabilities, and strengths is developed for each boy. Boys will be placed in industrial jobs as first step in comprehensive follow-up program.
Duration: Not reported.
Investigator(s): Eliot D. Chapple, Ph.D.; Jeffrey Beeson, M.D.; and Martha Fontana Vrolyk, Research Foundation for Mental Hygiene, Rockland State Hospital, Orangeburg, N. Y. 10962.
Cooperating group(s): Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.

21-JI-3 STUDY OF THE PROGRAM OF THE GEORGE JUNIOR REPUBLIC

Purpose: To explore the feasibility and design of studies to describe and evaluate the socio-cultural features of the George Junior Republic's residential treatment community as related to the growth, development, adjustment, and behavioral changes in troubled adolescents. Special attention will be devoted to such unique features as the self-government of adolescents and the economic system.
Subjects: Entire population of the community, i.e., adult staff members and adolescents, perhaps with selected sub-samples for intensive attention.
Methods: Initially, field observation.
Duration: April 1966-March 1968.
Investigator(s): Robert E. Pittenger, M.D., Director of Research and of Psychiatric Services, and William E. Knox, Ph.D., Research Project Supervisor, The George Junior Republic, Freeville, N. Y. 13068.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

BEST COPY AVAILABLE

21-JI-4 CLINICAL INVESTIGATION OF CROSSED CONTROL IN A RESIDENTIAL TREATMENT CENTER

Purpose: To test whether work done by Berner and Berner on remedial treatment of crossed control in private practice of ophthalmology would be applicable to students in a residential school for special students.
Subjects: 900 residents of Devereux Schools.
Methods: Children are screened for visual and/or visual-motor problems, and those with suspected poor eye use on the side of the handedness or any mixed use of hands and feet are given an ophthalmological examination with full study of binocular vision function. Recommendations may include prescription of glasses, orthoptic training, or treatment of crossed control, or a combination of the above. Specific treatment of crossed control involves use of glasses if indicated, occlusion of one eye if indicated, and development of unilateral motor use on the side of the established or being established controlling eye. Children are followed up and directed toward establishing total unilaterality in control of binocular vision, primary hand use, and foot use.
Findings: No observation has been made to contradict earlier studies of crossed control by Berner and Berner. Treatment of crossed control leads to improved academic achievement and general progress and adjustment of Devereux School residents.
Duration: June 1960-June 1970.
Investigator(s): George E. Berner, M.D., Consultant in Ophthalmology; Dorothy E. Berner, B.S., Consulting Orthoptic Technician; Marguerite B. Horn, M.A., Language Development Psychologist; and Walter M. Uhler, M.D., Head of Medical Staff, The Devereux Schools, Devon, Pa. 19333.
Cooperating group(s): The Devereux Foundation.
Publication: Southwestern Medicine 44:2, 1963; Devereux Schools Monograph planned for Spring 1967.

21-JI-5 DEVELOPMENT OF YOUTH SERVICE

Purpose: To develop and evaluate a youth service which will be an all-purpose psychiatric facility for treatment, training, and research.
Subjects: Eventually, 25 boys and 20 girls, ages 15 to 19. First group will consist of six boys to age 17, five of whom have been diagnosed as behavior disorders, the sixth a behavior disorder combined with psychomotor epilepsy.
Methods: Complete facilities, including individual and group therapy and casework with patients and their families will be intensified and expanded, as will academic and vocational education. There will be full use of ancillary therapies, as well as standard treatment procedures. An evaluation by clinical and psychological methods will be made of the milieu, group, individual and family, occupational, recreational, and educational therapies.
Duration: June 1966-May 1970.
Investigator(s): Newton Bigelow, M.D., Director, Marcy State Hospital, Marcy, N. Y. 13403.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

21-JI-6 EVALUATION OF AN ADOLESCENT UNIT IN A STATE HOSPITAL FOR THE MENTALLY ILL

Purpose: To evaluate the outcome of a newly established program for providing daytime services for patients in an adolescent unit.
Subjects: Boys and girls, ages 16 to 18, who were admitted to the adolescent program and are expected to be hospitalized for at least six months, and patients of the same age group on the regular adult wards and not in the special unit for adolescents.
Methods: Attendance at staff meetings, analyses of staff minutes, interviews with staff and patients, administration of special tests and attitude scales, analysis of case records; study of the patient careers of adolescents in the program and comparison with adolescents of the same age group in the regular adult wards; and observation of role relations of staff members within the adolescent unit and with staff members of other units.
Duration: January 1967-March 1968.
Investigator(s): Irving Babow, Ph.D., Research Social Scientist, Napa State Hospital, Imola, Calif. 94558.
Publication: An evaluation report is planned and will be available from the principal investigator; journal article also planned.

21-JI-7 TREATMENT OF ADOLESCENT PRIMARY BEHAVIOR DISORDERS

Purpose: To improve the effectiveness of the juvenile unit of Rockland State Hospital through a coordinated program involving the incorporation of a number of programs into an overall organizational design and a continuous individual treatment plan and intensive follow-up from patient's admission to the hospital through his final job and family placement in the community after discharge.
Subjects: Primarily, those patients in the male admission and older adolescent buildings; ultimately, all 700 patients in the juvenile unit, ages 5 to 16.
Methods: Development of coordinated data on each child; interviews with each child to determine his interactional patterns so that he may condition himself to manage his own reactions to stressful situations; placement of children in wards, occupants of which are homogeneous with respect to age, maturation level, behavior pattern, and intellectual potential; utilization of modern educational methods (I.T.A., learning machines, etc.) with total educational effort organized around the ward as a unit; establishment of sheltered workshops in a vocational rehabilitation setting; correlated evaluation and treatment by social worker, vocational rehabilitation counselor, teachers, and group workers; follow-up of case for two years after discharge from hospital.
Duration: 1966-1971.
Investigator(s): Alfred M. Stanley, Senior Director, and Eliot D. Chapple, Ph.D., Principal Research Scientist, Rockland State Hospital, Orangeburg, N. Y. 10962.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

21-JI-8 THE "ARMY" INCIDENT: THE PSYCHOLOGY OF UNIFORMS AND THEIR ABOLITION ON AN ADOLESCENT WARD

Purpose: To elucidate the social and clinical implications and the specific therapeutic values of the wearing of uniforms by nurses and aides on an inpatient service for 8- to 18-year-olds and to clarify and redeem the clinical significance of the institution and the authority such uniforms embody.

Subjects: Patients and staff of a Rapid-Turnover Latency-and-Adolescent Ward in a metropolitan receiving hospital.
Methods: Participant-observation of group behavior during a critical period before and after abolition of staff uniforms, examining particularly the determinants of the decision to eliminate them and immediate impact of their disappearance.
Findings: The innovation in dress lead to an insurrection in which patients became mobilized as a uniformed "army." Uniforms emblematically clarify institutional social structure and the roles of individuals in it in a manner reassuring to both staff and patients, most especially adolescent patients. Their presence may stabilize group dynamics by acting more to distract attention from and rationalize potentially disruptive conflicts than to intensify them. They may mediate between a hospital and its patients by embodying the hospital's often maligned but potentially most therapeutic qualities--its institutional nature and authority itself. By attracting or encouraging the transference of positive and/or negative feelings toward the institution it represents, a uniform may sustain, re-direct, or divide these feelings in a fashion that offers great benefit to some patients.
Duration: October 1965-completed.
Investigator(s): Donald J. Marcuse, M.D., Staff Child Psychiatrist, Mental Health Study Center, National Institute of Mental Health, 2340 University Blvd. E., Adelphi, Md. 20783.
Cooperating group(s): Adolescent Psychiatric Inpatient Service Staff of Jacobi Hospital, Bronx Municipal Hospital Center, and Albert Einstein College of Medicine, Bronx, N. Y.
Publication: Submitted to professional journal.

Socially Deviant

Note: Some of the following delinquency studies, as well as a few in other categories, were taken from the section "Current Projects," in Crime and Delinquency Abstracts, Vol. 4, Nos. 1 and 2, 1966 (formerly entitled International Bibliography on Crime and Delinquency). This publication is prepared by the National Clearinghouse for Mental Health Information of the National Institute of Mental Health (Bethesda, Md. 20014) from material provided by the National Council on Crime and Delinquency (44 E. 23rd St., New York, N. Y. 10010). The studies are noted: (Reported by NCCD.)

21-KA-1 PARTURITION IN A PSYCHIATRIC HOSPITAL

Purpose: To learn what social plans (relative, foster home, adoptive) were made for care of infants born to pregnant patients in a State Hospital. Certain descriptive data were obtained about the mothers and their babies to determine which mothers kept or relinquished their children.
Subjects: 133 mothers and 144 infants.
Methods: A retrospective study of clinician record of patients giving birth during the period from 1950 to 1962.
Findings: Most women who gave birth in this State Hospital had been admitted during their pregnancy. The remainder became pregnant while on visits and leaves. At parturition the mothers tended to be unmarried white schizophrenic women between 30 and 40 years old. The mothers' families

cared for 37.7 percent of the babies; social agencies cared for 26.8 percent in foster homes, and 35.5 percent were relinquished for adoption. Between 1950 and 1962 there were 144 babies born, including six fetal or neonatal deaths. Among the 138 live births there were four sets of twins and a sex division of 73 girls and 65 boys. A statistically significant level of association was found between the mother's decision to keep this child and having given birth to a prior child.
Duration: 1964-1965.
Investigator(s): Donald T. Lee, M.S.W., Chief, Social Service Department, Camarillo State Hospital, State Department of Mental Hygiene, Box A, Camarillo, Calif. 93010.
Publication: Publication planned.

21-KA-2 HARTFORD OUT-OF-WEDLOCK (HOW) STUDY

Purpose: To determine the magnitude and ramifications of the problem of out-of-wedlock births of mothers delivered in Hartford hospitals; to develop guides for future programming for mothers pregnant out of wedlock and for early case-finding for all prenatal patients.
Subjects: Approximately 3,000 mothers, pregnant out of wedlock, and their infants delivered in Hartford hospitals from January 1, 1961 through December 31, 1965.
Methods: Comparison and evaluation of data for mothers pregnant out of wedlock, tabulated annually from birth and death certificates; dissemination of these data among physicians, nurses, and social workers serving unwed mothers and their infants; collection of medical, nursing, and social data on unwed mothers and their infants; future plan for program for mothers pregnant out of wedlock.
Duration: March 1962-June 1967.
Investigator(s): Jessie E. Parkinson, M.D., Director, and Alberta Martucci, Research Analyst, Bureau of Maternal and Child Health, Hartford Health Department, 56 Coventry St., Hartford, Conn.
Cooperating group(s): McCook Memorial Hospital; Mount Sinai Hospital; Saint Francis Hospital; Hartford Hospital; Visiting Nurse Association; Catholic Family Services; Jewish Social Service; Children's Services of Connecticut; Hartford Welfare Department; Connecticut State Department of Health; Connecticut State Welfare Department, Hartford, Conn.; Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.
Publication: Progress reports distributed in April 1964 and May 1965. Final report to be prepared in 1967 for publication.

21-KA-3 CONNECTICUT STUDY OF ILLEGITIMACY, 1966

Purpose: To improve social, medical, and educational programs and facilities for illegitimately pregnant women. To answer such questions as: (1) What is happening in Connecticut relative to illegitimate pregnancies; (2) What is the present extent and trend; (3) Who and where are the unwed mothers, in which socio-economic areas; (4) Who are the alleged fathers; (5) What social agencies provide what service to which unwed mother; (6) What is the mobility and source of maintenance of the unwed mother; (7) What is the extent of medical care provided; (8) How does the outcome of out-of-wedlock pregnancies compare with that of legal pregnancies in terms of birthweight distribution and fetal, neonatal, and infant mortality; (9) What happens to the babies born to these mothers. The ultimate goal is prevention.

Subjects: All illegitimately pregnant women known to any social agency, nursing agency, juvenile court, corrective institution, school, hospital, or mental institution in Connecticut. (It is estimated that 70 to 90 percent of Connecticut's unwed mothers have had at least one contact with one or more of these agencies in regard to their pregnancies. We can only assume that those mothers who leave the State and have no contact with a Connecticut agency are offset by mothers entering Connecticut from other states who use our agency services.)
Methods: Printed questionnaires have been made available to all the above agencies throughout Connecticut to be filled out for each known illegitimately pregnant woman, regardless of whether or not the agency is able to follow each woman through to a pre-designated three-month post-partum period. Women who make just one agency contact and then disappear are logged as known cases to be watched for elsewhere at delivery time. When a woman is referred to a different agency, the partially filled out questionnaire is also sent to the referral agency for completion. When the infants born of these pregnancies are three months old, a record of their status is filled out, and the completed questionnaire is then mailed to the State Department of Health for editing, coding, and data processing. From this, an analysis with informative tables will be printed.
Duration: January-December 1966.
Investigator(s): Jo Ann Gustafson, Research Analyst, Maternal and Child Health Section, Connecticut State Department of Health, 79 Elm St., Hartford, Conn. 06115. (Reported by Harold S. Barrett, M.D., Deputy Commissioner, Connecticut State Department of Health.)
Cooperating group(s): Connecticut Child Welfare Association; Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.
Publication: Publication planned.

21-KA-4 EVALUATION OF EFFECTIVENESS OF A COMPREHENSIVE CARE PROGRAM FOR UNWED SCHOOL AGE GIRLS IN CHICAGO

Purpose: To assess the outcome of the multi-faceted program and the efficacy of varied interventions; to find implications which will help in the development of more effective services and more pertinent programs under government and voluntary auspices.
Subjects: 1,200 to 1,500 unwed pregnant adolescent girls in the Chicago area, 108 of whom received comprehensive care.
Methods: Model includes two groups; one group receives all available services while the other receives little or no care until delivery. Evaluation of the efficacy of the medical, educational, social, and psychological services provided. The data collection instrument developed earlier will be used with personality inventories and rating scales to measure intervention and change.
Findings: Results of this program have encouraged the development of a larger program providing comprehensive care. 61 percent of the clients came from one parent families, 40 percent of the clients and 61 percent of their parents were born in the South, and 32 percent of the clients were conceived out of wedlock.
Duration: October 1966-continuing.
Investigator(s): Jean E. Bedger, M.A., Diploma in Clinical Psychology, Research Director, Florence Crittenton Association of America, Inc., 608 S. Dearborn St., Chicago, Ill. 60605.
Cooperating group(s): Chicago Board of Health; Chicago Board of Education; Illinois State Department of Public Health; Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.
Publication: Findings of the evaluation to be published when available.

21-KB-1 OUTPATIENT GROUP PSYCHOTHERAPY WITH JUVENILE SEX OFFENDERS: A PSYCHOANALYTIC MODEL

Purpose: Based on Freud's Three Essays on Sexuality, this research is to demonstrate a psychoanalytic model of treatment for the so-called "sociopathic" chronic sex offender and the reconstruction of his personality.
Subjects: A homogeneous group of sex offenders only (exhibitionists, child molesters, and rapists), and a heterogeneous group of sex offenders and other offenders.
Methods: Group psychotherapy.
Duration: 1966-December 1967.
Investigator(s): Hans A. Illing, Ph.D., The Hacker Clinic, 3621 Century Blvd., Lynwood, Calif. 90262.
Publication: To be presented during the 25th Annual Convention of the American Group Psychotherapy Association in Chicago, Illinois, January 1968.

21-KC-1 JUVENILE ARRESTS IN CINCINNATI, 1963-1964

Purpose: To determine whether (1) there are any identifiable characteristics which distinguish between recidivists and non-recidivists, (2) various types of services rendered by different agencies have a different effect on youngsters' adjustment, (3) there is a lag or lack of services for youngsters who come in contact with the Juvenile Police, and (4) the proper referral or disposition of juvenile arrests is made.
Subjects: 15,000 boys and girls, representing 25,000 arrests.
Methods: Family background is traced, and subjects are followed for several years.
Duration: June 1965-1968.
Investigator(s): Murray Weisman, Associate Director, The Citizens' Committee on Youth, 909 Plum St., Cincinnati, Ohio. (Reported by NCCD.)

21-KC-2 A STUDY OF THE SOCIAL MILIEU OF THE GREATER CHARLESTON AREA

Purpose: To study the social milieu in which the children and youth of the greater Charleston area live and grow; to develop hypotheses regarding the patterns of social forces and structures which lead to social pathology in this community; to make proposals for suitable community intervention.
Methods: All existent studies of the community, particularly those relating to services to children and youth, will be examined. Major social institutions and agencies in the area, including schools, courts, informal children's and youth groups, police, and private welfare agencies will also be studied to correlate inadequacies and gaps in community services with social pathology, including juvenile delinquency, youth crime, and school dropouts. Recreational and job opportunities for youth and adults also will be studied and related to youth attitudes and behaviors. Ecological analysis, relating the findings about the community and about the social pathology of its children and youth, will follow.
Duration: Not reported.
Investigator(s): Gordon S. Jaeck, Charleston Youth Community, Inc., No. 8 Terminal Building, Eighth Floor, Charleston, W. Va. (Reported by NCCD.)
Cooperating group(s): Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-KE-1 SOME BEHAVIORAL CORRELATES OF CEREBRAL DYSRHYTHMIA IN DELINQUENTS

Purpose: To explore behavioral differences between matched groups of delinquents and normals with average or above average scores on I.Q. tests, and to explore further differences between two matched groups of delinquents, one with definite signs of cerebral dysrhythmia on the EEG, and another without such signs.
Subjects: 20 normal subjects, and 43 delinquent subjects in two groups which were differentiated in terms of presence or absence of definitive signs of cerebral dysrhythmia on the EEG recordings. Subjects were male, ages 13 to 18, I.Q. 90 to 130, and racial origin 80 percent white.
Methods: Behavioral aspects investigated by this study included risk-taking behavior using games from game theory, neuroticism, extraversion, personal constructs, and psychomotor inhibition. All experimental subjects, certified to be clearly dysrhythmic or clearly non-dysrhythmic by two neurologists, were required to take an EEG. Control and experimental subjects were then given paper-and-pencil tasks devised to measure proclivity for risk-taking, the Maudsley Personality Inventory for measures of extraversion and neuroticism, Kelly's Personal Constructs Test, and Colvin's Spiral Test of Psychomotor Inhibition.
Findings: 1. There were significant differences between normal and delinquent groups in terms of playing a conservative, but ultimately rewarding, minimax strategy. There were no differences, however, between the two groups of delinquents. 2. Significant differences were found between dysrhythmic and non-dysrhythmic delinquent groups on the Spiral Test of Psychomotor Inhibition. The dysrhythmic group was consistently inferior in inhibiting the motor response.
Duration: Completed.
Investigator(s): James A. Beshai, Ph.D., Assistant Professor of Psychology, Duquesne University, Pittsburgh, Pa. 15219.
Cooperating group(s): University of Kentucky; Veterans Administration Hospital, Lexington, Kentucky.
Publication: A copy of Dr. Beshai's Ph.D. dissertation is available upon request.

21-KE-2 PERSONALITY FACTORS WHICH INFLUENCE CLOTHING FABRIC SELECTIONS BY DELINQUENT GIRLS

Purpose: To determine relationship between personal characteristics and clothing fabric preferences of delinquent girls.
Subjects: Delinquent girls at Utah State Industrial School and non-delinquent girls at a local high school.
Methods: Compton Fabric Preference Test was administered to delinquent and non-delinquent girls to yield scores for (1) tints, shades, and bright colors, (2) strong vs. weak figure-ground contrasts, (3) warm vs. cool colors, (4) large vs. small designs, and (5) rough vs. smooth textures. Fabric preferences will be analyzed in relation to physical measurements, perceptual types (reducers, augmenters, moderates) as determined by subjects' methods of processing the sensory environment in terms of size perception, masculinity-femininity aspect of personality as measured by the Franck Drawing Completion Test, and body image (barrier concept and penetration of boundary aspects of personality) as measured by Rorschach content analysis.
Duration: July 1965-December 1966.
Investigator(s): Norma H. Compton, Ph.D., Head, Clothing and Textiles Department, College of Family Life, Utah State University, Logan, Utah 84321.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

21-KK-3 MATURATIONAL REFORM AND RURAL DELINQUENCY

Purpose: To investigate the extent to which delinquency can be viewed as a product of the stress which attaches to adolescent status in our society, and the specific character of the maturational reform that occurs as the deviant adolescent moves into adulthood; specifically, to examine, in a non-metropolitan environment, the nature of the shifting commitments that occur in the areas of education, work, family, community, and peer group involvement as a part of the process of maturational reform. Further, to examine geographic mobility of problem and non-problem youth in order to assess the extent to which rural delinquency leads to adult maladjustment among those youth who migrate to the city.
Subjects: A 25 percent simple random sample (N=310) of the approximately 1,250 sophomore boys enrolled in the schools of Marion County in December 1964; a 100 percent sample of those youth who dropped out of school any time subsequent to December 1964 (N=125); and a 100 percent sample of those youth whose names appeared in the juvenile court records of the county (N=260). The random sample itself provided at least 100 youth with one or more of the following characteristics: low educational achievement, rural residence, low socio-economic status, no college plans.
Methods: Cohorts were initiated during their sophomore year of high school, at which time they completed a detailed questionnaire. They were first interviewed approximately two years later during their senior year. These procedures provided two waves of data prior to age 18 and high school graduation. Together, with subsequent yearly interviews for four additional years, they permit the tracing of changes that take place from a point in mid-adolescence (age 15) to early adulthood (age 21). Twenty-five percent of the items in the interview schedule were identical to those appearing in the earlier questionnaire and will provide direct comparisons in each of the five areas of the "competing commitments" hypothesis. In addition, at least one question from each of the five major areas was "pre-keyed" with the respondent's previous answer in an effort to detect change. Instances of major change were probed in some depth concerning how and why the change had come about. Supportive procedures include collection of year-by-year records of academic performance and year-by-year court and police records so that patterns of maladjustment (including time origins and persistence) can be established for different cohorts.
Duration: June 1966-May 1971.
Investigator(s): Kenneth Polk, Ph.D., Principal Investigator, Marion County Youth Study, 1859 E. 15th Ave., and Associate Professor, Department of Sociology, University of Oregon, Eugene, Ore. 97403. (Reported by F. Lynn Richmond, Study Director, Marion County Youth Study.)
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: It is anticipated that results will be published in a variety of articles and monographs. In addition, papers reporting research findings will be presented at regional and national professional meetings as well as state and regional conferences attended by professionals and sub-professionals working directly with rural youth.

21-KK-4 DELAY OF GRATIFICATION, PORTEUS MAZE TEST PERFORMANCE, AND BEHAVIORAL ADJUSTMENT IN A DELINQUENT GROUP

Purpose: To explore relationships between a behavioral and verbal measure of delay of gratification, Porteus Maze Test measures of planning ability and foresight and impulse control, and ratings of adjustment in a school for delinquent adolescent males.
Subjects: First 50 new admissions to the New Mexico Boys School who said they smoked; mean age 16.0.

Methods: Porteus Maze Test and an essay measure of delay of gratification were administered. Subjects were also given a coupon good for one cigarette immediately or a pack of cigarettes if they waited nine days. Subjects were rated on adjustment by school staff.
Findings: Both measures of delay significantly related to Porteus measures and adjustment ratings. Delay of gratification related, in part, to age and ethnic group membership but not to I.Q.
Duration: 1964-1966.
Investigator(s): Alan H. Roberts, Ph.D., Associate Professor of Physical Medicine and Psychology, University of Minnesota, Minneapolis, Minn. 55455; and Robert V. Erikson, M.A., Student, University of North Dakota, Grand Forks, N. D. 58202.
Publication: Publication in psychology journal, 1968.

21-KE-5 DELINQUENT BEHAVIOR OF CHILDREN BELOW THE AGE OF CRIMINAL RESPONSIBILITY

Purpose: To learn basic social characteristics of children who commit offenses while under age nine, the age of criminal responsibility in Israel.
Subjects: All children who committed an offense in Israel in 1965 while under age nine.
Methods: Police files are surveyed. Data are gathered on basic social characteristics of these children and on the kind of offenses they commit. A sample of this surveyed group will be subjected to more intensive study. Psychological and sociological tests will be given, and a typology of delinquent children and of criminogenic conditions and situations will be established. A follow-up study will be done at two-year intervals.
Duration: March 1966-continuing.
Investigator(s): Menachem Amir, Ph.D., Institute of Criminology, The Hebrew University, Jerusalem, Israel. (Reported by NCCD.)
Cooperating group(s): Henrietta Szold Research Institute for Children and Youth, Jerusalem; Israel Ministry of Social Welfare.

21-KF-1 AN EXAMINATION OF PHYSICAL CHARACTERISTICS, INTERPERSONAL RELATIONSHIPS, AND PERSONALITY TRAITS OF ADOLESCENTS CONVICTED OF MULTIPLE CAR THEFTS

Purpose: To test hypothesis that adolescents convicted of multiple car thefts would display certain emasculated needs which would gain expression in the symbolism of the power, status, and mobility of the automobile, and that there would be certain physical characteristics, personality factors, and social factors which would explain the etiology of the multiple car thefts.
Subjects: Youths, ages 16 to 21, under supervision of the New York State Division of Parole between September 1, 1965 and March 31, 1966, 15 of whom had committed two or more car thefts, and 15 of whom had never committed a car theft.
Methods: Records were analyzed according to a wide range of criteria which evaluated the social history, family structure, and self-image of the subjects.
Findings: Although there were no distinguishable physical characteristics between the two groups, the multiple car theft offenders were notably submissive to authority, had underachieved in school, and had admittedly felt negatively of their own self-worth and competency. The failure to establish a causal relationship between the experimental group and certain environmental influences, namely structure of family and disciplinary practices of both parents, was attributed to the smallness of the sample studied.

Duration: Not reported-June 1966.
Investigator(s): Chester G. Fritz and Seymour L. Storch, School of Social Work, Syracuse University, Syracuse; and John M. Stanton, Ph.D., Director of Research, State Division of Parole, Box 1679, Albany, N. Y. (Reported by NCCD.)

21-KH-1 PSYCHOSOCIAL NETWORKS OF YOUNG DANGEROUS DRUG USERS

Purpose: To study the psychosocial network of the adolescent dangerous drug user and his immediate family living in the home.
Subjects: Ten networks are to be studied during the course of the project. Sampling of race, socio-economic, and ethnic groups.
Methods: Weekly family therapy sessions and large group psychotherapy meetings of kinship, friendship, and peer networks aimed at producing change in the social nexus around the young, dangerous drug user's family. Field work, intensive case study methods of families and networks.
Duration: September 1966-June 1969.
Investigator(s): Ross V. Speck, M.D., Clinical Associate Professor and Head, Section of Social and Community Psychiatry, Department of Psychiatry, Hahnemann Medical College, 249 N. Broad St., Philadelphia, Pa. 19107.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Journal articles planned; also reports to National Institute of Mental Health.

21-KH-2 DRUG HABITS OF ADOLESCENTS

Purpose: To demonstrate types and frequency of ingestion of drugs in the adolescent age group, the responsible factors, i.e., socio-economic, environmental, etc., and the role of television in initiating drug dependency.
Subjects: Adolescent girls and boys.
Methods: Survey by questionnaire, actual spot check of girls' pocketbooks, and home visits.
Duration: July 1967-July 1969.
Investigator(s): Jay M. Arena, M.D., Professor of Pediatrics and Director, Poison Control Center, Duke University, Durham, N. C. 27706.

21-KH-3 SURVEY OF THE INFLUENCE OF ALCOHOLIC BEVERAGES ON DELINQUENT YOUTH

Purpose: To study the influence of alcoholic beverages on the behavior of delinquent youth.
Subjects: 355 cases involving juvenile delinquents, excluding cases of dependency, neglect, and traffic violations. 96 of these involved drinking at the time of the violation.
Methods: A report was submitted on each case by the juvenile court judge in four Ohio counties. Data were broken down by age, sex, and race.
Findings: Over 68 percent of the delinquency violations in which drinking was detected were committed by 16- and 17-year-olds; over 82 percent of the incidents involved males; over 94 percent involved members of the white race; most girls who were drinking at the time of the violation for which they were apprehended were drinking in someone's

home or car; most of the boys' drinking was of a more clandestine nature; 25 percent of the offenses committed while drinking were major offenses; and drinking was involved in 27 percent of the total number of cases reported.
Duration: Not reported.
Investigator(s): Daniel W. Johnson, Chairman, Ohio Youth Commission, 2280 W. Broad St., Columbus, Ohio 43223. (Reported by NCCD.)
Cooperating group(s): Data Processing Section, Department of Liquor Control; Ohio Parent-Teacher Association; Governor's Action Committee on Teen-Age Drinking, Ohio.

21-KJ-1 CASE STUDIES OF LARGE FAMILIES

Purpose: To provide a sample of large non-problem families as a contrast to so-called problem families, which are typically large in size.
Subjects: Large families in which there were at least five children of school age. In half the families children were coping satisfactorily, and in others they were coping unsatisfactorily and having many problems, one of which was delinquency.
Methods: Social work students visit one problem and one non-problem family each week and become participant observers. Comparisons are made in terms of housing, father's occupation, regularity and earning capacity, mother's capacity as a housewife and her ability to control and provide affection for the family. Results are analyzed in terms of marked differences in parental personalities and attitudes, as well as in terms of certain differences in material conditions.
Duration: 1953-1967.
Investigator(s): Pauline Shapiro, Social Study Department, University of Birmingham, Birmingham 15, England. (Reported by NCCD.)

21-KJ-2 UNEMPLOYMENT AND JUVENILE DELINQUENCY

Purpose: To determine the relationship, if any, between unemployment and juvenile delinquency, particularly in the northeast of England, as an aftermath of the recession of 1961-1963.
Subjects: Male offenders, ages 14 to 17; males who were age 15 in 1962.
Methods: The group of young men who left school in 1962, when there was a surplus among the juvenile labor force, are being studied. A descriptive approach will be used to learn the coincidence of unemployment with delinquency and the possible consequences of the labor surplus on careers, particularly the incidence of delinquency.
Duration: April 1964-April 1967.
Investigator(s): M. Beeson, Senior Research Fellow in Criminology, University of Durham, 23, Old Elvet, Durham, England. (Reported by NCCD.)
Cooperating group(s): Great Britain Home Office.

21-KK-1 A STRUCTURAL APPROACH TO GANG INTERVENTION: THE LINCOLN HEIGHTS PROJECT

Purpose: To decrease gang-related delinquency through reduction of gang cohesiveness.
Subjects: Over 125 male and female members of the "Clover" gangs in East Los Angeles.

Methods: A conceptual model for gang intervention, based upon a previous project in Los Angeles, is utilized. This consists of detached workers, resource activation in the community, field observation of cohesiveness, and analysis of offense rates and patterns.
Duration: May 1966-April 1968.
Investigator(s): Malcolm W. Klein, Ph.D., Project Director, Youth Studies Center, University of Southern California, University Park, Los Angeles, Calif. 90007.
Cooperating group(s): Los Angeles County Commission on Human Relations; Ford Foundation; Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.
Publication: Journal articles planned; also six-month progress reports.

21-KK-2 YOUTH LEADERSHIP TRAINING PROJECT

Purpose: To re-socialize delinquents so that they prepare themselves for new careers in youth development and delinquency prevention work; to assess effectiveness of former delinquents as streetworkers; and to measure influence trainees can exert on peers by channeling energies from delinquent to constructive activities.
Subjects: 18 former delinquents.
Methods: Streetworker trainees are selected from high school dropouts with substantial arrest records to undergo a training program of counseling and classroom work. They are eventually placed in social agencies in high-delinquency areas as non-professional trainee aids, where they help to organize neighborhood youth councils through which gang members assist with problems that confront community organizations serving youth in slum areas. These include schools, public playgrounds, employment agencies, the police, State Welfare Department, and Department of Juvenile Probation. Trainees meet directly with agency officials to discuss methods of dealing with mutual problems.
Findings: Some change toward desired objectives has occurred.
Duration: February 1966-January 1968.
Investigator(s): Mario D'Angeli, Ph.D., Professor and Chairman, Department of Social Welfare, San Francisco State College, San Francisco, Calif.
Cooperating group(s): Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.
Publication: Publication planned for early 1968.

21-KK-3 SOUTHERN ARIZONA PRE-DELINQUENCY PROJECT

Purpose: To demonstrate a program for early intervention in identified pre-delinquent, pre-dropout cases; to develop a program of consultation which will be appropriate to a sparsely-populated, multi-ethnic group area, where direct professional contact with behavior-problem individuals is unfeasible.
Subjects: Children identified as pre-delinquent, pre-dropout cases.
Methods: Careful assessment of the child, his family, and other significant individuals in his natural environment is utilized. All therapeutic intervention is mediated by these naturally-related individuals. The intervention program is created to take advantage of child's reinforcement hierarchy. Mediators are chosen according to their ability to administer the selected reinforcements contingent on successive approximations to the desired behavior by the child. Non-professional case aides will be trained to consult "mediators."
Duration: Not reported.

Investigator(s): Gaylord Thorne, Ph.D., and Roland Tharp, Ph.D., Director, Psychology Department, Southern Arizona Mental Health Center, 1930 E. Sixth St.; Ralph Wetzel, Ph.D., Associate Professor, Psychology Department, University of Arizona, Tucson, Ariz.
Cooperating group(s): Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-KK-4 TOMPKINS COUNTY YOUTH COURT, NEW YORK

Purpose: To conduct an experimental project in citizenship training; to supplement existing facilities for the control and prevention of juvenile delinquency in Tompkins County.
Subjects: Teenagers in Tompkins County.
Methods: Volunteer lawyers instruct adolescents in court procedure, the meaning of law, and qualifications to practice in a court; duly qualified teenagers function as judges and jury in the operation of the court process and attend workshops with their parents. Offenders, ages 12 to 18, who have committed minor offenses and are not known to have psychological or social problems are judged by a court of their peers, and punishment (a certain number of hours of work) is substituted for "treatment" in the sentencing. Workshops for parents are also held.
Duration: 1961-1967.
Investigator(s): Malcolm J. Freeborn, Chairman, Administrative Board, Tompkins County Youth Board, 121 East Court St., Ithaca, N. Y. (Reported by NCCD.)
Cooperating group(s): Ithaca Youth Bureau.

21-KK-5 PREVENTION OF TEENAGE GANG FIGHTING

Purpose: To develop and improve methods for the prevention of recurrent teenage gang fighting; to attempt to re-direct these energies into constructive channels.
Subjects: Teenagers in Mexican-American slums of South El Paso, Texas, where fighting gangs emerge every 10 years.
Methods: Educational and vocational training.
Duration: Not reported.
Investigator(s): Salvador Ramirez, El Paso Boys' Club, P. O. Box 10097, El Paso, Tex. (Reported by NCCD.)
Cooperating group(s): Our Lady's Youth Center, El Paso; Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-KK-6 EVALUATING THE IMPACT OF VOLUNTEER WORKERS IN THE PREVENTION, CONTROL, AND TREATMENT OF JUVENILE DELINQUENCY

Purpose: To demonstrate and evaluate the potential and effectiveness of the use of volunteer personnel in action programs designed for the prevention, control, and treatment of juvenile delinquency.
Methods: Project evaluates such areas as volunteer recruitment, participation in group discussion programs and tale-playback discussion sessions held between adolescents and adults, parent groups, police, teachers, and other significant forces within the lives of adolescents. There is an

evaluation of the net effect of volunteer participation in accomplishing program goals as compared with the amount of professional staff time required to support volunteer activities. Project also evaluates use of upperclass college youth as assistant probation officers and the effect which such a program has on the probationers within the program as well as the effect on the college youth in orienting them toward a career in the corrections field. The maximum number of channels for effective volunteer contribution to a juvenile court effort will be developed and evaluated.
Duration: February 1966-July 1967.
Investigator(s): Ivan H. Scheier, Ph.D., Boulder District Court, Boulder, Colo. 80301. (Reported by NCCD.)
Cooperating group(s): Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-KK-7 SOUTH BROOKLYN YOUTH LEADERSHIP PROJECT

Purpose: To decrease juvenile delinquency through the reduction of intergroup conflict, thereby improving intergroup relations; to build on already established intergroup leadership and extend its influence to other peer leaders in the community.
Methods: Youth leaders will be encouraged to assert their influence on the more critical age group of 6- to 12-year-olds, by providing recreational and club situations for the older youth of the project to indicate that it is both safe and wise to share contacts and activities with youth of differing ethnic backgrounds. A Parent's Workshop will be organized to involve adults in inter-ethnically shared experiences; comparable workshops for youth will be established. Project will seek to involve the New York City Youth Board and its Street and Athletic Club Services on a more direct and continuous basis in order to relate youth and family. Services of community mental hygiene experts will be sought through a canvassing of area facilities.
Duration: Not reported.
Investigator(s): Joseph L. Maniscalco, Project Director, South Brooklyn Improvement Council, Inc., 750 President St.; and Dr. Abraham Blumberg, Research Consultant, Assistant Professor of Sociology, Department of Sociology and Anthropology, Brooklyn College, Brooklyn, N. Y. 11210.
Cooperating group(s): Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-KP-1 ASSESSMENT OF THE COMMUNITY DELINQUENCY CONTROL PROJECT OF THE DIVISION OF PAROLE

Purpose: To determine if there is any difference in parole performance of wards released directly to an intensive parole program in the community as compared with wards institutionalized and then released to a regular parole program.
Subjects: Wards committed to the California Youth Authority by Juvenile Court from the project area in Los Angeles. (N=200 experimentals plus controls, yearly).
Methods: Random assignment to experimental (project) or control (regular program) condition; collection of relevant data on wards, program, and parole outcome.
Duration: March 1966-indefinite.

Investigator(s): Bertram M. Johnson, B.A., Senior Social Research Analyst, and Esther M. Pond, B.A., Associate Social Research Analyst, Division of Research, California Youth Authority, State Office Building No. 1, Sacramento, Calif.
Publication: Progress reports will be made yearly, beginning with the Summer of 1967. Findings will be published when available, beginning no sooner than 1969, by the Research Division of the California Youth Authority.

21-KP-2 COMMUNITY DAY-CENTER PROGRAM OF THE LOS ANGELES COUNTY PROBATION DEPARTMENT

Purpose: To modify personal difficulties and behavior of children of low income families, who would otherwise require twenty-four hour residential care and treatment, to the extent that the evident need for institutional placement will be circumvented.
Subjects: Children from low income families in the Los Angeles area.
Methods: Children are brought to the centers and returned home daily. Intensive counseling procedures with individuals and groups of children, remedial education, group activities, and family conferences are the significant elements of the program. It is assumed that greater personal competence, a more positive self-image, and improvement in the quality of family life will result. Program is geared for a six-month cycle, at the end of which it is anticipated that most children may be "graduated" to the regular program of probationary supervision and returned to their community school.
Findings: Brief experience with first center has demonstrated that boys and their families have developed a positive identification with the program and its aims.
Duration: March 1966-continuing.
Investigator(s): Stephen W. McAtee, Supervising Deputy Probation Officer, Community Day-Center Project, Suite 170, P. O. Box 4002, Los Angeles, Calif. 90012.
Cooperating group(s): Special Schools Section, Los Angeles County Board of Education; Economic and Youth Opportunities Agency, Los Angeles, Calif.; U. S. Office of Economic Opportunity.

21-KP-3 A COMPARATIVE STUDY OF THE ATTITUDES OF PROBATION OFFICERS AND OF MEMBERS OF PROBATION COMMISSIONS IN BELGIUM

Purpose: To discover if basic differences which would affect the way in which probation is utilized and applied do exist between the various categories of people charged with the administration of probation.
Methods: Psychometric and sociometric tests are used to discover whether the change from traditional repressively authoritarian treatment of delinquents to rehabilitative methods has modified the basic attitudes and emotions of probation officers. Their test scores are compared with other groups, such as probation commission members, including magistrates, civil officials, and lawyers, and students of the State Institute of Social Studies.
Duration: May 1965-January 1967.
Investigator(s): Judge Séverin-Carlos Versele, 30 Avenue Brugmann, Brussels 6, Belgium. (Reported by NCCD.)
Cooperating group(s): Institute of Sociology, Free University of Brussels; Institut d'Etudes Sociales de l'Etat, Belgium.

21-KP-4 JUVENILE COURT DEMONSTRATION PROJECT

Purpose: To demonstrate a means of changing the theoretical orientation, the diagnostic process, and the treatment program of the juvenile court.
Subjects: Delinquents in a selected neighborhood in New York City.
Methods: A small experimental unit has been established to penetrate, describe, and assess a selected neighborhood in terms of the delinquency-producing cultural and organizational patterns therein which are contributing to the illegal behavior of the children living in the area. Based upon results obtained from the community assessment, it will establish a local community action program whose function is to alter neighborhood delinquency-producing patterns. These assessment and program procedures complement and run parallel to the standard social and psychiatric study procedures and supervision ordinarily given to delinquents coming from the experimental area who are placed on probation by the Juvenile Term of the Family Court of New York.
Duration: 1966-1968.
Investigator(s): John M. Martin, Professor, Department of Sociology and Anthropology, Fordham University, Bronx, N. Y. (Reported by NCCD.)
Cooperating group(s): Graduate School of Social Work, New York University; New York City Family Court; New York City Office of Probation; Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-KQ-1 CITIZENS' COMMITTEE ON YOUTH: YOUTH WORKER PROGRAM

Purpose: To test hypothesis that, by extending group work services to clusters of disadvantaged youngsters at an early age, one can enhance their social and cultural opportunities and re-direct them toward acceptable channels and outlets.
Subjects: Boys and girls, ages 10 to 14, who show adjustment problems and are referred by school, police, or social service agencies.
Methods: Children are assigned to a professionally supervised volunteer Youth Worker responsible for six to eight children with whom he meets at least twice a week. Programs are designed to enhance the youngsters' interests in acceptable activities and include athletic events, dances, camping, movies, plays, bowling, discussions, etc.
Findings: Schools report improvement. Three of the 15 groups have attained a high enough degree of social maturity and cohesiveness to function as autonomous, responsible groups and have been transferred to existing youth-serving agencies such as a church and a neighborhood house.
Duration: June 1965-1968.
Investigator(s): Murray Weisman, Associate Director, The Citizens' Committee on Youth, 909 Plum St., Cincinnati, Ohio. (Reported by NCCD.)

21-KR-1 RESIDENTIAL TREATMENT CENTER FOR JUVENILE OFFENDERS

Purpose: To demonstrate the effectiveness of Opportunities, Inc., a non-profit service organization which provides a community residential treatment program as an alternative to probation or commitment to a state training school.
Subjects: Boys, ages 13 to 16, who have been adjudged delinquent by the family court, whose personal, home, or community situation contraindicates probation, but whose behavior problems are not serious enough to require commitment to a state training school. Boys are referred by the family court, subject to acceptance by the professional staff.

Methods: Group and individual counseling; use of community services including schools, medical, psychiatric, and psychological services and private and public social agencies; aftercare. Minimum length of stay is about three months.
Duration: May 1966-June 1968.
Investigator(s): Carlton H. Gregory, 51 Governor Bradford Dr., Barrington, R. I. (Reported by NCCD.)
Cooperating group(s): Office of Law Enforcement Assistance, U. S. Department of Justice.

21-KR-2 EVALUATION OF CHANGES IN TECHNIQUE OF TRAINING IN A CLOSED BORSTAL

Purpose: To evaluate effectiveness of changes in techniques in a closed borstal in terms of subsequent behavior of adolescents during first three years after release.
Subjects: Older adolescents in a closed borstal.
Methods: Traditional regime has been changed to one based upon individual training and treatment programs for each inmate. Tests, questionnaires, interviews, and prediction techniques are being used to assess individual change and response. A sociological study of the regime throughout the period is also being made.
Duration: January 1963-December 1969.
Investigator(s): F. H. McClintock and A. E. Bottoms, Institute of Criminology, Cambridge University, 7 West Rd., Cambridge, England. (Reported by NCCD.)
Cooperating group(s): Prison Department, Great Britain Home Office.

21-KR-3 AN ALTERNATIVE TO INSTITUTIONALIZATION FOR DELINQUENT BOYS

Purpose: To rehabilitate delinquent boys through a group-centered treatment program combining discussion and work activities as an alternative to institutionalization.
Subjects: Randomly selected 16- and 17-year-old boys who would ordinarily be assigned to Mayaguez Industrial School.
Methods: Boys divide their time between paid work experience in the morning and compulsory attendance at afternoon group sessions designed to give them the opportunity of "talking out" problems with their peers. Unstructured discussion sessions permit free exchange of ideas, and boys are provided insights into conditions which contributed to their delinquency. The community-based work experience program provides an opportunity for the acquisition of good work habits, a sense of cooperation with others, and an adjustment to the discipline of working a fixed number of hours each day. The concept of allowing the boys to return home evenings and weekends provides continuous opportunities for working out problems within each youth's own environment. Remedial education and vocational placement are provided in cooperation with a variety of community institutions. As each youth is released from the program, a replacement is added. Boys completing the program will be invited to continue their participation in the group sessions.
Duration: Not reported.
Investigator(s): Awilda Lopez, Assistant Professor, Department of Public Health and Preventive Medicine, School of Medicine, University of Puerto Rico, San Juan, P. R. (Reported by NCCD.)
Cooperating group(s): Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-KR-4 A PROGRAM FOR THE TREATMENT OF DEFECTIVE DELINQUENTS

Purpose: To expand a program found helpful in dispersing the pessimistic atmosphere surrounding treatment for those individuals with the double limitations of mental retardation and severe behavioral problems.
Subjects: Defective delinquents at Oregon Fairview Home.
Methods: A program has been established based on educational and psychological principles and primarily focused on those behavioral manifestations displayed in the ward which make the individual delinquent unacceptable in other living situations. Intensive individual treatment is given each delinquent by all levels of staff. Patients are also given work experience.
Findings: Program effected favorable changes in earlier group of patients exhibiting dangerous aggressive behavior.
Duration: 1963-continuing.
Investigator(s): Dr. D. L. Callicrate, Oregon Fairview Home, 2250 Strong Rd., S.E., Salem, Ore. (Reported by NCCD.)
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

21-KR-5 HOME AFTERCARE PROGRAM FOR BOYS DISCHARGED FROM CORRECTIONAL INSTITUTIONS

Purpose: To open a halfway house for boys recommended for release from correctional institutions who have no approved home to which they may go. Project is based on assumptions that (1) social restoration of a delinquent boy requires that he be part of a family; (2) the natural home can be helped to meet and maintain minimum standards for the boy's return; and (3) when this fails, the boy can be matched with a foster family trained to carry the transitional role for successful social restoration.
Methods: A special foster family recruitment program is conducted in Negro, white, and interracial neighborhood groups and churches which have common associations. These provide natural groups for training and a structure of support for the families and boys. Foster families will become involved in future recruitment and training of other foster families. Evaluation will cover such questions as: (1) can such homes be found; (2) is the predicted chain reaction initiated; (3) can the concepts of social restoration be validated.
Duration: Not reported.
Investigator(s): William F. Bussiere, Friends Neighborhood Guild, 703 North Eighth St., Philadelphia, Pa. 19123. (Reported by NCCD.)
Cooperating group(s): Franklin House, Philadelphia; Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-KR-6 INCENTIVE PAYMENTS FOR EMPLOYMENT PROGRAMS FOR YOUTHFUL MISDEMEANANTS

Purpose: To test the effectiveness of providing work adjustment experiences for youthful misdemeanants who, as a group, generally receive little training during their incarceration due to their relatively short and varying sentences.
Subjects: Youthful misdemeanants at the District of Columbia Workhouse.
Methods: Through the Special Services for Offenders Program, work adjustment experiences will be provided for misdemeanants. On the basis of these experiences, recommendations to employees can be made by a job developer connected with the Misdemeanant Program. In order to insure releasees money to support themselves until their first paychecks, a wage

incentive program has been conceived by which men earn money which will be put in their own accounts in a Credit Union, and given to them upon release, with counsel of a money management counselor.
Duration: Not reported.
Investigator(s): James G. Banks (formerly) Executive Director, and Hugh K. Johnson, Director, Division of Delinquency and Crime Control, United Planning Organization; Ulysses G. Garland, Assistant Superintendent of Workhouse, and Ray Nelson, Assistant Director, Department of Corrections, Washington, D. C.
Cooperating group(s): Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-KS-1 REHABILITATION OF DELINQUENT BOYS

Purpose: To make a comparative analysis of the effectiveness of four rehabilitative programs for delinquents: Probation; Essexfields (a non-residental group-centered program); Highfields (a residential group-centered program); and Annandale (the State Reformatory).
Subjects: 1,210 16- and 17-year-old males from one county with no previous institutionalization, and without severe mental retardation or disturbance; processed by same juvenile court.
Methods: Social background data, delinquency history, and Minnesota Multiphasic Personality Inventory profiles obtained on boys processed by court and sent to above programs, from January 1962 to 1965. All boys followed up for in-program failure and recidivism after completion of treatment to January 1966. Post-MMPI's were given after treatment and compared with pre-MMPI's. Rates of recidivism were determined for each program for all boys who completed treatment and for matched groups across programs. Various other types of treatment of data were made.
Duration: January 1962-March 1967.
Investigator(s): Richard M. Stephenson, Ph.D., Chairman, Department of Sociology, Douglass College, Rutgers, The State University, New Brunswick, N. J. 08903.
Cooperating group(s): Ford Foundation; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Ford Foundation report in preparation; report on MMPI data submitted to National Institute of Mental Health.

21-KS-2 THE REHABILITATION OF DELINQUENT RETARDATES

Purpose: To demonstrate and evaluate techniques for rehabilitating delinquent retardates; to modify and eliminate undesirable, antisocial behavior and to develop more adequate personal, social, recreational, educational, and vocational skills, so that the delinquent retardate may lead a relatively productive life in the community.
Subjects: One cottage unit of 20 boys and one of 20 girls.
Methods: Techniques based on the principles of reinforcement are applied within a controlled environment where conditions for learning are optimal. The resident's freedom and responsibility will gradually be increased, enabling him to learn to behave appropriately in situations which are similar to those existing in the community.
Duration: February 1966-January 1969.

Investigator(s): J. F. Elliott, M.D., Superintendent, Medical Department; John D. Burchard, Ph.D., Assistant Professor, Clinical Psychologist, Psychology Department; and B. G. Tate, Ph.D., Research Psychologist, Psychology Department, Murdoch Center, Butner, N. C. 27509.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

21-KS-3 OUTWARD BOUND AS AN ALTERNATIVE TO INSTITUTIONALIZATION FOR JUVENILE DELINQUENTS

Purpose: To demonstrate the efficacy of the Outward Bound Schools and their methods of reducing recidivism among delinquent boys as an alternative to institutionalization.
Subjects: 84 delinquent boys, half of whom will come from the reception center of the Massachusetts Youth Service and half from an institution serving as a halfway house.
Methods: Boys will be exposed to Outward Bound (a crisis-intervention type program) and their progress followed for one year from date of parole. Participating observers, data processing, and parole officers will be used to establish correlations between success or failure of individual boys and those from Outward Bound.
Investigator(s): Joshua L. Miner, III, Outward Bound, Inc., 16 School St., Andover, Mass. 01810. (Reported by NCCD.)
Cooperating group(s): Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-KS-4 PARKLAND NON-RESIDENTIAL GROUP CENTER

Purpose: To rehabilitate delinquent male offenders by establishing a conventional culture with resulting non-delinquent values, goals, and behavior; to test hypothesis that more continuity between a rehabilitation program and community life is provided through a non-residential setting.
Subjects: Male offenders, ages 13-1/2 to 15-1/2, from junior high schools in the West End area of Louisville.
Methods: Non-residential group center is located on grounds of a local junior high school. Guided group interaction, regular and remedial education, a work program, intensive group work with the children's parents, and integrated research evaluation. After 7 to 12 months of participation in the program as a condition of probation, each subject is involved in an intensive aftercare program for up to 12 months.
Duration: February 1965-May 1967.
Investigator(s): Newton McCravy, Jr., Project Director; Robert Fishman, Research Director; and James Earl Howard, Financial Officer, Kentucky Child Welfare Research Foundation, Inc., P.O. Box 713, Frankfort, Ky. 40601.
Cooperating group(s): Southfields Residential Group Center; Youth Bureau, Louisville Police Department; Louisville Board of Education; Jefferson County Juvenile Court; Kentucky Department of Child Welfare; Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

THE CHILD IN THE FAMILY

Family Relations

21-LA-1 RESEARCH-ACTION ON PREVENTION OF FAMILY DISORGANIZATION

Purpose: To study family disorganization in process by longitudinal research on social functioning of a random sample of young, urban families; to provide multi-faceted, early intervention to families showing emerging malfunctioning in the direction of social disorganization; and to evaluate effect of such intervention by means of an experimental control design.
Subjects: 855 young urban families selected randomly from the register of first births to mothers under the age of 30.
Methods: Panel interviewing of control groups; services, based on a systematic assessment of family need, to the experimental group; periodic evaluation of family functioning of experimental and control group families; research on interventive method using a structural Treatment Log; study of relationship between child-rearing attitudes and practices using PARI scales and other instruments; and analysis of process of families' socialization into client role.
Duration: September 1964-August 1969.
Investigator(s): Ludwig L. Geismar, Ph.D., Professor of Social Work and Sociology, Graduate School of Social Work, Rutgers, The State University, New Brunswick, and Director, Family Life Improvement Project, Child Service Association, 284 Broadway, Newark, N. J. 08903.
Cooperating group(s): Welfare Administration, U. S. Department of Health, Education, and Welfare.
Publication: Social Casework 47:9:563-570, November 1966 (Part I), and 47:10:663-667, December 1966 (Part II). Others in press or in preparation.

21-LA-2 PARENTAL MALEVOLENCE AND CHILDREN'S INTELLIGENCE

Purpose: To confirm preliminary evidence suggesting that parental malevolence or rejection is inversely related to children's intelligence.
Subjects: 451 third-grade children and their parents.
Methods: Determined the product-moment correlations between the California Test of Mental Maturity I.Q.'s of these children, as measured in the classroom, and the independent responses of their parents to four different parental interview indices of parental malevolence. Three relationships between variables mentioned above and parental educational level and socio-economic status were also investigated.
Findings: Parental malevolence and child's I.Q. are negatively correlated. The strongest association between parental malevolence and child's I.Q. occurs between mother-daughter pairs. Linkage between parental malevolence and child's I.Q. is most apparent among parents having less than a high school education.
Duration: March 1960-January 1968.
Investigator(s): John R. Hurley, Ph.D., Professor of Psychology, Michigan State University, East Lansing, Mich. 48823.
Cooperating group(s): School officials of Columbia County, New York; Mental Health Research Center, Rip Van Winkle Foundation, Hudson, New York; Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Accepted for publication in Journal of Consulting Psychology.

21-LA-3 THE FAMILY IN THREE TYPES OF SOUTHERN ITALIAN COMMUNITIES

Purpose: To investigate changes in family roles and aspirations under conditions of social change.
Subjects: Adolescent sons, fathers and mothers--160 families, approximately 480 subjects.
Methods: Scheduled interviews; some use of pre-collected statistics.
Duration: 1965-1968.
Investigator(s): Albert D. Ullman, Ph.D., Professor of Sociology, Tufts University, Medford, Mass. 02155.
Cooperating group(s): Centro di Specializzazione e Recerche Economico - Agrarie per il Mezzagiorno, Naples, Italy.
Publication: Papers planned for early 1968.

21-LA-4 PATTERNS OF MOTHER-INFANT CONTACT: THE SIGNIFICANCE OF LATERAL PREFERENCES

Purpose: To explore the functioning and motivations determining the observed left lateral placement of infants by Salk, Weiland, and Sperber.
Subjects: Infants, college students, young mothers, others.
Methods: Mothers are observed holding infants, and methods are compared to methods of holding other, similar sized objects. Exploration is made of the effect of anxiety on lateral placement of objects, of involvement of subjects in fantasy play with objects, noting lateral placement when fantasy stimulation is anxiety versus infant plus anxiety, and of the evaluation of pain (anxiety) threshold on exposure to a variety of auditory stimuli including heartbeat sounds.
Findings: Objects other than infants under neutral conditions were evenly divided in terms of lateral placement.
Duration: 1960-continuing.
Investigator(s): I. Hyman Weiland, M.D., Director, San Fernando Valley Child Guidance Clinic, 7335 Van Nuys Blvd., Van Nuys 91405; and Zanwil Sperber, Ph.D., Chief Psychologist, Department of Child Psychiatry, Cedars-Sinai Medical Center, Los Angeles, Calif.
Publication: *Journal of the American Academy of Child Psychiatry* 3:1, January 1964, and 1967.

21-LA-5 THE TRANSITION TO PARENTHOOD

Purpose: To investigate the influence of parenthood in marriage.
Subjects: 500 couples--100 couples in each of four social class groups having their first child; 50 with no child and 50 having their second child.
Methods: Each couple was interviewed three times--once before and twice after pregnancy--with the nullipara interviewed as one control during the same length of marriage periods. Structured questionnaire used. Improvisation and projective material gathered.
Duration: 1962-1967.
Investigator(s): Harold Feldman, Ph.D., Professor, Department of Child Development and Family Relationships, New York State College of Home Economics, Cornell University, Ithaca, N. Y.; and Joseph H. Meyerowitz, Ph.D., Assistant Professor, Baylor University, Houston, Tex.

S. Department of Health, Education, and Welfare.
Publication: Research report available from investigators.

21-LG-1 SIBLING ADJUSTMENT TO CHILDHOOD LEUKEMIA

Purpose: To evaluate adaptation of siblings and families to the illness and death of one of its members, a child with leukemia.
Subjects: 50 children under treatment for leukemia, and their parents and siblings.
Methods: As the life span of childhood leukemia has recently increased from an average of three months to over sixteen months, parents are now exposed to the prolonged anxiety of a critically ill child who will experience painful medical procedures, hospitalizations, remissions, and ultimate death. Study attempts to identify those conditions within the family (communication, religion, social stress) and those within the parents and siblings (age, intelligence, personality structure) related to adaptation to the illness. Such an assessment will hopefully permit realization of conditions facilitating and/or inhibiting adaptation of the healthy siblings to the prolonged illness and death of the child with leukemia.
Duration: Not reported.
Investigator(s): Nathaniel N. Wagner, Ph.D., Chief Psychologist, and Brenda D. Townes, M.A., Instructor, Department of Psychiatry, University of Washington; John R. Hartmann, M.D., Director, Division of Hematology and Oncology, and Elspeth Wallace, R.N., Children's Orthopedic Hospital, Seattle, Wash. 98105.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

21-LG-2 CHANGES IN CHILDREN'S BEHAVIORAL STATUS FOLLOWING ANESTHESIA

Purpose: To investigate the frequency of behavioral changes, negative and/or positive, following inhalation anesthesia and surgery in children, in general, and as a function of different types of pre-medication, ages, and socio-cultural groups and hospitals.
Subjects: 200 children up to 14 years of age undergoing tonsillectomy at three different hospitals in the United States and Canada, and a control group of children undergoing routine physical examinations.
Methods: A questionnaire developed by Vernon and Schulman specifically to test for the more common behavioral upsets is administered to mothers on the morning of the operation or examination and 14 days later. Certain demographic data are also recorded.
Findings: Initial indications are that any changes are difficult to detect and have been considerably overemphasized perhaps because of the retrospective nature of most studies or because separation from parents and surroundings is more important than anesthesia and/or surgery, or because the group is, for the most part, beyond the vulnerable age.
Duration: July 1965-July 1967.
Investigator(s): H. T. Davenport, M.D., Department of Anesthesia, Vancouver General Hospital, Vancouver, British Columbia, Canada; and John S. Werry, M.D., Research Child Psychiatrist, Children's Research Center, and Assistant Professor of Psychiatry, Department of Psychology, University of Illinois, Urbana, Ill. 61801.

Child Rearing

21-MB-1 BREAST FEEDING: INCIDENCE AND TREND IN UNITED STATES HOSPITALS ON EXIT FROM NEWBORN NURSERIES, AFTER TWO DECADES

Purpose: To compare trend in breast feeding over the past ten years with trends established by studies conducted in 1946 and 1956.
Methods: Questionnaires submitted to nursery supervisors in hospitals having a birth census of more than 300 infants per year. Count made of breast-fed, bottle- and breast-fed, and bottle-fed infants. Data also gathered on special care of premature or low-weight infants, age at first feeding and at departure from hospital, etc. Reports catalogued according to States, geographic areas, urban, suburban, or rural locale of hospital. Data compared with findings of the two previous studies.
Duration: Not reported.
Investigator(s): Herman F. Meyer, M.D., Associate Professor, and Robert B. Lawson, M.D., Professor, Department of Pediatrics, Northwestern University Medical School, 4001 Kirk St., Skokie 60016, and Chief of Staff, Children's Memorial Hospital, 707 Fullerton Ave., Chicago, Ill. 60612.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-MB-2 FIFTY FAMILIES STUDY. PHASE II: INFANT ACCIDENT

Purpose: To identify the child-care practices, including neglect and abuse, that may contribute to infant accidents; to identify possible differences between abused and non-abused infants; to ascertain differences between families displaying deviant and adequate child care; to examine and evaluate staff decisions about discharge planning and follow-up care of patients; and to determine factors affecting the actual outcome for patients. (Bulletins 11 and 15, Research Relating to Children.)
Subjects: Between 75 and 100 infants under 13 months of age and living in a family, who are presented to Children's Hospital of Pittsburgh for X-ray following a traumatic episode.
Methods: On the basis of a research interview of the mother in the home and pediatric and behavioral evaluation, infants are selected for longitudinal study. Longitudinal study involves: second research interview of the mother in the home, interview of father, observation of mother feeding baby, mailed questionnaire, a fifth step not yet determined, final evaluation of the baby, and a final interview with the parents.
Duration: October 1964-September 1968.
Investigator(s): Elizabeth Elmer, M.S.S., Director, Infant Accident Study, Children's Hospital, and Instructor; Grace S. Gregg, M.D., Assistant Clinic Professor; John B. Reinhart, M.D., Associate Professor of Child Psychiatry; and Byron Wight, M.A., Research Associate, Department of Pediatrics, Graduate School of Public Health, School of Medicine, University of Pittsburgh, Pittsburgh, Pa. 15213.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Papers will be published as sections of the research are analyzed. Final publication will probably be in the form of a monograph.

21-MC-1 INFANT STIMULATION--PARENT EDUCATION PROJECT

Purpose: To demonstrate a way in which early intervention into the lives of babies might break the poverty cycle; to attempt to simultaneously raise the chances that the infant will reach a higher level of intellectual functioning and that the adults who mother him will gain in competence and feelings of self-worth.

Subjects: 200 "disadvantaged" mothers and their infants born at the J. Hillis Miller Health Center, University of Florida, between June 1966 and February 1967.

Methods: Fifteen women drawn from same population are trained in series of stimulation experiences, interview techniques, and observation procedures. Each of these women parent educators is placed with 10 families, whom she visits weekly. There are two control populations, one not visited, and one visited by nurses but not receiving instructions in stimulation.

Findings: Starting at end of three months of instruction (baby's six-month birthdate) stimulated babies indicate greater ability to perform perceptual-motor tasks.

Duration: June 1966-September 1967.

Investigator(s): Ira J. Gordon, Ed.D., Professor, and Director, Institute for Development of Human Resources, College of Education, University of Florida, Gainesville, Fla. 32601.

Cooperating group(s): Funds for the advancement of education; Colleges of Medicine, Nursing, Health Related Services, University of Florida.

Publication: Various educational and psychological journals.

SOCIO-ECONOMIC AND CULTURAL FACTORS

21-NB-1 HUMAN RESOURCE DEVELOPMENT AND MOBILITY IN THE RURAL SOUTH

Purpose: To ascertain occupational, residential, and social aspirations and expectations of representative samples of high school youth in the southern United States; to determine, through a longitudinal survey, major factors and influences of the decision-making process of youth and how these are related to their aspirations and expectations. Further, to follow up these youth to determine what relationship may exist between their aspirations and expectations while in high school and their future occupational and social behavior and the related causal factors.
Subjects: Representative samples, by sex, race, residence, and type of school, of Georgia high school students, particularly those in 10th grade.
Methods: Forced-response type questionnaires have been devised and administered to groups of students in selected high schools in 1966. Schedules will be administered in other selected schools. Data regarding school and community have been collected on separate schedules. Data for 1966 have been coded, punched on IBM cards, tabulated, and are now being analyzed in terms of certain basic hypotheses regarding aspirations, expectations, and decision-making process of youth.
Findings: Responses by 10th graders in one low income rural county support the hypothesis that Negro youth have aspirations and expectations far beyond those of their parents, as well as beyond opportunities ordinarily available to them. Responses are almost identical with those of white respondents, although the latter come from more advantaged parents, in terms of marital stability and educational and occupational achievement. Negro youth view military service as an opportunity for advancement rather than as something undesirable, and Negro males, along with Negro and white females, would rather work inside, and with people, whereas white males would rather work outside and with things.
Duration: July 1965-June 1970.
Investigator(s): John D. Kelley, Ph.D., Associate Professor of Sociology and Agricultural Economics, University of Georgia, Athens, Ga. 30602.
Cooperating group(s): This is part of the Cooperative Regional Project. The major cooperating groups in this particular phase of the S-61 Southern Regional Rural Sociology Research Project are at Louisiana State University, Mississippi State University, Clemson University, and Texas A. & M. University. Alabama, Florida, North Carolina, and Tennessee will also be cooperating. U. S. Department of Agriculture.
Publication: Georgia Agricultural Experiment Station Bulletins, Cooperative Southern A.E.S. Regional Bulletins, journal articles, and miscellaneous reports will be published.

21-NE-1 ALTERNATIVES TO VIOLENCE: ALIENATED YOUTH AND CIVIL RIGHTS, RIOTS AND THE ANTI-POVERTY PROGRAM

Purpose: To find out about the participation of teenagers alienated from major community institutions, in civil rights activities, riots, and relevant anti-poverty programs, and what they mean to the youth. Recommendations are developed to try to better relate these young people to such institutions and to help them make the transition to healthy adulthood.

Subjects: Small number of groups of alienated youth.
Methods: Interviews were held in nine large cities across the country. A small number of groups of youth were interviewed, but primary reliance was placed on sessions with adults who are highly knowledgable about alienated youth, such as street workers, probation officers, educators, staff of human relations groups, civil rights leaders, staff of Neighborhood Youth Corps, etc. The cities visited were: Boston, Chicago, Cleveland, Detroit, Los Angeles, New York, Philadelphia, Rochester, New York, and Washington.
Findings: With a small number of exceptions, alienated youth in these large cities did not participate in an organized and continued way in civil rights activities. Emotionally and socially, however, these movements did influence the youth. There were many indications of their participation in riots (Watts, Rochester, etc.). They did not plan the violence but were caught up in the excitement. Very small numbers of alienated youth were reported as going to the Job Corps camps. Much larger numbers participated in and benefitted from the Neighborhood Youth Corps, subject to significant limitation. In some of the cities there were impressive examples of locally designed projects financed with Office of Economic Opportunity funds.
Duration: July 1966-October 1967.
Investigator(s): Saul Bernstein, M.S.W., Professor and Head of Group Work Department, School of Social Work, Boston University, 755 Commonwealth Ave., Boston, Mass. 02215.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Book to be published by Association Press, late in spring or early in summer of 1967.

21-NE-2 STUDENT MOBILITY IN SELECTED MINNEAPOLIS PUBLIC SCHOOLS: FACTORS ASSOCIATED WITH DIFFERENT DEGREES OF STUDENT MOBILITY

Purpose: To investigate certain factors related to high and low geographic mobility.
Subjects: Sixth grade children from low income families in downtown Minneapolis and children from families of above average incomes living in the outlying areas of the city.
Methods: Comparisons of high and low mobility students in divergent economic areas.
Findings: Profile of the low mobility inner-city youth revealed that he was of average intelligence and reading ability for his grade and less inclined to be absent, delinquent, or non-white than the highly mobile child living in his neighborhood. However, he was four times as likely to be excessively absent and three times more likely to be delinquent than the child with a stable residence in a high income neighborhood. The chances that he came from a "normal" home were about the same as those for the highly mobile youngster living in the wealthier part of the city, better than for the mobile youngster in his own neighborhood, and worse than for the wealthier child of average mobility.
Duration: 1963-1966.
Investigator(s): R. W. Faunce and Bonnie J. Murton, Youth Development Project, Chicago at Sixth St., Minneapolis, Minn. 55415. (Reported by NCCD. See Note, p. 73.)
Cooperating group(s): Minneapolis Public Schools; Community Health and Welfare Council of Hennepin County; Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-NE-3 STUDENT MOBILITY IN SELECTED MINNEAPOLIS SCHOOLS: MOBILITY OF ELEMENTARY SCHOOL CHILDREN IN HIGH AND LOW DELINQUENCY AREAS

Purpose: To describe geographic and school mobility of two samples of elementary school children.
Subjects: 373 students from Youth Development Project target areas, which are characterized by high rates of delinquency, broken homes, dependency, and poverty; a comparison group of 425 students from areas of Minneapolis with low delinquency rates.
Methods: Analysis of school and police records to obtain background and mobility information.
Findings: There were substantial differences between the two groups for factors which were relatively free from bias of middle class value orientation (e.g., race, family size, birthplace) as well as those which were not (e.g., intelligence test and reading test scores). Target area school children had changed schools and homes twice as often as students in comparison sample. (By the time he has reached the sixth grade, target area student has, at the minimum, lived in three homes and attended three schools.) Three out of ten target area children remained in same school from kindergarten through sixth grade, as compared to the six out of ten who continued in same school for this period from the comparison group. Target area students usually remained in same school for 45 consecutive months out of a possible 70, while the typical comparison group student had 58 consecutive months in the same setting. Target area children have, on the average, missed 100 days of education by the time they reach the sixth grade.
Duration: 1963-1966.
Investigator(s): R. W. Faunce, M.A., Research Director; Donald D. Bevis; and Bonnie J. Murton, Youth Development Project, Chicago at Sixth St., Minneapolis, Minn. 55415. (Reported by NCCD. See Note, p. 73.)
Cooperating group(s): Minneapolis Public Schools; Community Health and Welfare Council of Hennepin County; Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-NE-4 LOWER EASTSIDE ACTION PROJECT, INC. (LEAP)

Purpose: To attempt to close the gap between the underachieving youth of the urban ghetto and their potentialities by providing relevant alternatives to resignation and failure.
Methods: Emphasis is placed on natural group development and self-determination, one-to-one relationships with staff, easy access to adult support, programming as determined by member interest, and the development of a social commitment. Project will address the problems of individuation, education, and social action, a major goal being the participation of youth in the solution of their own community's problems, allowing for their development as an effective and constructive force for change.
Duration: June 1966-not reported.
Investigator(s): Laurence S. Cole, Director, and Muzafer Sherif, Consultant for Research and Evaluation, Lower Eastside Action Project, Inc., 44 East 3rd St., New York, N. Y. 10003.
Cooperating group(s): Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-NG-1 KIBBUTZ PERSONALITY IN THE SECOND GENERATION

Purpose: To examine personality development in an Israeli collective settlement (kibbutz). It is a follow-up and expansion of the research carried out on the same kibbutz some 16 years ago by Professor Melford E. Spiro of the University of Chicago. (See Research Relating to Children, 6-K-3.) The long-term personality development of the generation examined by Spiro is being assessed while a similar evaluation is being made of the development of the youngest generation of children, the children of the former subjects.
Subjects: Entire population of second and third generation children and adults currently residing in the kibbutz.
Methods: Methods range from informal observation carried out in the process of participant observation to more formal interviewing and psychological testing, both projective and non-projective.
Duration: June 1966-June 1968.
Investigator(s): Leslie Y. Rabkin, Ph.D., Assistant Professor of Psychology, University of Rochester, Rochester, N. Y. 14627.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Articles, monographs or books, and papers are planned, beginning in 1968.

21-NG-2 A STUDY OF CULTURAL ATTITUDES TO DISABILITY OF CHILDREN IN ISRAEL, THROUGH THE USE OF THE PICTURE RANKING TEST

Purpose: To measure the acceptability of various social and physical handicaps among children in Israel stemming from different cultures through the use of the Picture Ranking Test; to compare these attitudes to those of Jewish and other children in the United States as reported by S. A. Richardson; to assess to what extent the Picture Ranking Test is an index of cultural behavior, and its importance as a scientific tool in cross-cultural studies.
Subjects: Children ages 10 and 11, in 10 different groups numbering about 100 each, and with approximately equal numbers of boys and girls.
Methods: Groups represent upper and lower social classes, Arabs, children of Israeli parents, new immigrants, urban and rural areas, ultra-orthodox, and children with parents from five different cultural groups--East Europe, Middle East, Yemen, North African, and English-speaking countries. Children are tested with identical technique used in America. Demographic data are gathered and findings subjected to statistical analysis.
Duration: September 1965-September 1966.
Investigator(s): E. Chigier, M.R.C.P.E., D.C.H., Pediatrician, and Miriam Chigier, B.A., School Health Service, Department of Education of Tel Aviv, 40 Joseph Zvi Street, Ramat Gan, Israel.
Cooperating group(s): Association for the Aid of Crippled Children.

21-NG-3 EDUCATIONAL ACHIEVEMENT AND LIFE STYLES IN A TRADITIONAL SOCIETY (OLD ORDER AMISH)

Purpose: To formulate the value orientation of the society, describe the socialization patterns in the context of the culture in a traditional community and in an emerging community, to discover the achievement levels of pupils in schools, and to discover the areas of conservation, deprivation, and social change.

1104

Subjects: Several midwestern communities sufficiently large enough to include traditional life styles as well as emerging life styles and communities.
Methods: The value orientation of the culture will be formulated from historical documents and by interviews with members of the contemporary community. The observation of behavior within the recognized age-sets will be done by a resident anthropologist in the field. This requires complete participation in the traditional community for all ages from infancy to adulthood, and of formal as well as informal culture. The school testing phase will center on measures of ability, intelligence, self-perception, and non-verbal exercises. Social change will be studied in three aspects: values retained, values intensified, and values rejected.
Duration: June 1966-August 1969.
Investigator(s): John A. Hostetler, Ph.D., Professor of Anthropology and Sociology, Temple University, Philadelphia, Pa. 19122.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Final report is planned.

21-NG-4 SPANISH URBAN MIGRANT FAMILY STUDY

Purpose: To discover changes which occur in Spanish-American patterns of child rearing in the process of adjusting to urban life, and to examine possible causes of these changes, such as adoption of new reference groups by migrant families, reactions to strains of urban living, or changes in family structure and physical environment.
Subjects: Six Spanish-American and six Anglo-American families in Denver, Colorado, and six rural Spanish-American families in the San Luis Valley, all from similar socio-economic backgrounds, with at least one child enrolled in Project Head Start.
Methods: Three one-hour observations of interactions between each mother and one of her pre-school children and several structured, semi-structured, and open-ended interviews will be conducted. Final study will increase length of direct observations and will include fathers, if possible. Measures include indices of identification with Anglo or Spanish reference groups, preference for Anglo or Spanish family norms, child-rearing expectations, attitudes and methods, and family structure.
Findings: Certain statistically significant Spanish-Anglo differences in parental attitudes and behavior are consistently found, in line with what would be expected from ethnographic reports. A number of urban-rural differences were also found between the two Spanish groups. Explanations for these differences are still being explored.
Duration: September 1965-June 1969.
Investigator(s): Nancy B. Kitts, Ph.D. Candidate, Institute of Behavioral Science, University of Colorado, Boulder, Colo. 80304.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Publication in preparation.

21-NG-5 THE AINU OF HOKKAIDO, JAPAN

Purpose: To record the ethnography, insofar as this is still possible, customs, and beliefs in the rearing and development of the child life of the Ainu.

Methods: Ethnographic field method: interviews, participation, observation of parental and environmental influence, as told primarily by the old Ainu men and women.
Duration: May 1965-1968.
Investigator(s): Sister M. Inez Hilger, Ph.D., Research Associate of the Smithsonian Institution, and Special Lecturer in Anthropology, College of St. Benedict, St. Joseph, Minn. 56374.
Publication: National Geographic, February 1967. Book planned for 1968; edited tapes of Ainu conversation and songs; and picture book of Ainu in action.

21-NG-6 STUDY OF DIFFERENT CULTURAL VALUES HELD FOR PHYSICAL ACTIVITY

Purpose: To investigate cross-national differences in the role of physical activity and sport in the life style of secondary school students in Australia, England, Canada, and the United States.
Subjects: Approximately 1,000 subjects were selected from the school population of one large city in each of the four countries. The sample included boys and girls representing two levels of attainment: grades 10 and 12 in Canada and the United States, 4th and 6th forms in England, and 3rd and 5th forms in Australia. Each sample was representative of the full range of intellectual ability and socio-economic status.
Methods: During 1966, three inventories were administered designed to elicit data on: attitude toward, and interest in, six classes of sport and physical activity; major social values; leisure time use, by self and family; number of siblings; birth order; national origin; social class; religious preference; need for approval; self-esteem, and body image, perceived and ideal. Data from these variables permitted the testing of a number of hypotheses concerning factors associated with attitude toward, and interest in, physical activity.
Findings: Preliminary findings are expected to be available by June 30, 1967. Further analysis will be undertaken during July and August.
Duration: September 1965-August 1967.
Investigator(s): Gerald S. Kenyon, Ph.D., Associate Professor, Department of Physical Education, School of Education, University of Wisconsin, Madison, Wis. 53706.
Cooperating group(s): Administrators and teachers in the school systems of Perth, Australia; Birmingham, England; Edmonton, Canada; and Cleveland, Ohio, U.S.A.; Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: A complete report will be available from principal investigator at termination of project. Manuscripts representing various aspects of the study will be prepared and submitted for publication.

21-NG-7 THE SOCIALIZATION OF THE CHILDREN OF EUROPEAN IMMIGRANTS IN TORONTO, CANADA

Purpose: To investigate the influence of parental background and length of residence in Canada on socialization patterns, family roles, and value conflict; to investigate the influence of socialization patterns and value conflict on motivation, cognitive development, and social relationships of adolescents from immigrant families.
Subjects: At least 600 adolescents of Italian and German origin and Canadian-born controls; also, approximately 200 parents.

Methods: Administration of story completions, projective questions, and scales to adolescents to measure parent-child interaction patterns, achievement values, achievement-risk preference, sociometric choice patterns, family life variables, etc.; parent and family interviews; and content analysis of group discussions among adolescents and parents.

Duration: May 1966-August 1968.

Investigator(s): Kurt Danziger, D.Phil., Professor of Psychology; Kathryn Koenig, Ph.D., Assistant Professor of Psychology; and Clifford Paynton, Ph.D., Assistant Professor of Sociology, York University, Toronto 12, Ontario, Canada.

Cooperating group(s): The Canada Council.

Publication: Publications planned.

21-NG-8 SOCIAL AND CULTURAL VARIABLES AS PERCEIVED BY GERMAN AND AMERICAN HIGH SCHOOL STUDENTS

Purpose: To investigate cross-cultural differences and similarities between German and American youth in the perception and conceptualization of a number of social and cultural variables.

Subjects: 180 high school students sampled from schools in Hamburg, Germany; 180 students sampled from schools in Houston, Texas.

Methods: Data are collected from two sources for each child: (1) factual information concerning sex, age, socio-economic status, study and leisure habits; (2) 22 semantic differential ratings on each of 11 socio-cultural concepts. Groups will be matched on basis of relevant variables. Attempts will be made to contrast "typical" profiles of German and American children.

Duration: July 1966-1968.

Investigator(s): Wiebke Thomsen, M.D., Instructor, and Willy A. Kouw, Ph.D., Assistant Professor, Department of Neurology and Psychiatry, University of Texas Medical Branch, Galveston, Tex. 77550.

Publication: Journal articles planned.

21-NG-9 MATERNAL CARE AND CHILD BEHAVIOR WITHIN THE STRUCTURE OF THE FAMILY IN JAPAN

Purpose: To identify and describe patterns of maternal care and child behavior in Japanese families; to determine relationship of these patterns to personality development, psychopathology, and the general social structure and social dynamics of Japanese life; to compare results obtained with similar data from other cultures, particularly the United States.

Subjects: Mother-infant pairs from 30 Japanese and 30 American middle class families. Infants were first-born, normal babies, and were three to four months old at time of observation.

Methods: Observation of mother and child in home was carried out on two days by a time-sampling technique devised by Rheingold and resulted in 800 observations on each case over a series of variables measuring behavior of mother and infant. The first 20 Japanese and first 20 American cases were selected for follow-up studies when the children are two-and-one-half and five-and-one-half years old.

Findings: Comparison of Japanese and American infants at three to four months of age indicates that the American baby is more alone, is more active in the manipulation of his body and in the use of objects, and is higher in vocalization. The Japanese baby is less alone, and is both physically and vocally quieter. Japanese mothers direct their actions

toward soothing and quieting their infants, while American mothers encourage response and activity. In Japan, style of life makes a difference in the behavior of infant and caretaker. In both Japan and America, the infant "learns" to pattern his behavior in terms of the cultural expectations of his mother by as early an age as three to four months.
Investigator(s): William Caudill, Ph.D., Chief, and Helen S. Weinstein, Section on Personality Development and Environment, Laboratory of Socio-environmental Studies, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: In Yearbook of the International Sociological Association, R. König and R. Hill (Eds.), 1966.

21-NG-10 CULTURAL DISCONTINUITY AMONG MISTASSINI CREE INDIANS

Purpose: To study the adaptation of Cree Indian children to radical discontinuity in their life experience occasioned by their removal to a residential school, or their entrance into the day school at Mistassini Post (Quebec, Canada); to understand better the linkages between cultural transmission and cultural change.
Subjects: 10 males and 12 females, ages 10 to 22, educational range from second grade to third year high school. All but one had attended the residential school.
Methods: Subjects were shown a series of 21 line drawings depicting activities instrumental in the Mistassini Cree Indian community to achievement of socio-economic goals and maintenance of life styles. Responses to this Instrumental Activities Inventory indicated relative rank order and value of the various activities depicted. In addition, a number of observations were made of Cree children and their families.
Findings: Subjects rank highest certain activities that fall outside of the traditional framework, such as carpenter, mechanic, and white collar worker. The traditional instrumental activity, trapping, has a median rank order but seems to be regarded as an alternative if other attempts fail. Additional findings.
Duration: Not reported-August 1967.
Investigator(s): George D. Spindler, Ph.D., Professor of Anthropology and Education, and Dr. Louise S. Spindler, Research Associate, Department of Anthropology, Stanford University, Stanford, Calif. 94305.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

EDUCATIONAL FACTORS AND SERVICES

General

21-OA-1 TO STUDY THE EFFECTS OF TEMPERATURE ON LEARNING

Purpose: To test hypothesis that there is no difference in pupil learning in a controlled ideal thermal environment and in a controlled deviate thermal environment.
Subjects: 22 pairs of fifth grade students matched for intelligence test scores, achievement test results, sex, age, and family backgrounds, and divided into experimental and control groups.
Methods: Experimental group was placed in a classroom where an ideal thermal environment ranging from 70°F to 74°F was maintained. The control group was placed in a deviate thermal environment where temperature was kept at a minimum of 76°F. Both customary school subjects and certain selected skills and subject areas were taught. In the selected areas, all teaching instruction to both groups of students was identical. At the end of approximately nine school weeks, the achievement of students in each classroom with regard to selected skills and subject areas was measured. Achievement of students in the ideal thermal environment was then statistically compared to achievement of students in the deviate environment.
Findings: There is no difference between pupil learning in a controlled ideal thermal environment and in a controlled deviate thermal environment.
Duration: August 1965-March 1966.
Investigator(s): Burdette P. Hansen (Ph.D. Candidate, University of Iowa), Manager, Test Services, Measurement Research Center; and Dr. Willard R. Lane, Professor, College of Education, University of Iowa, Iowa City, Iowa.
Cooperating group(s): Saydel School District and Lennox Industries, Iowa; Office of Education, U. S. Department of Health, Education, and Welfare.

21-OB-1 PERCEPTIONS BY COUNSELEES OF VARIOUS PROCEDURAL APPROACHES IN INITIAL COUNSELING SESSIONS

Purpose: To determine the relationship of specific types of cognitive functioning and age level to preferences for defined counseling approaches.
Subjects: 100 ninth grade males, 100 ninth grade females, 100 twelfth grade males, and 100 twelfth grade females, selected at random from a local high school population.
Methods: Five counselors were filmed in five episodes, each representing five different counseling orientations (advising, reflecting, supporting, questioning, and informing) with a male client and female client, resulting in fifty filmed episodes. One set of 25 episodes, to be used with male subjects, showed male counselor and counselee; the remaining 25 episodes, a male counselor and female counselee. Counselee responses were near identical in all episodes, reflecting only differences in male and female

activities. Each subject reviewed five episodes, each having a different counselor and different counseling approach. Episodes were presented at random. Subjects were asked to rate each counselor on three dimensions: helpfulness, understanding, and degree of desired relationship. After this rating, subjects completed Westcott revised Information Demand and Problem Solving Success Scale.
Duration: September 1965-December 1966.
Investigator(s): Oliver H. Bown, Director, and Lewis F. James, Research Associate, Department of Educational Psychology, University of Texas, Austin, Tex. 78712.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Final report available.

21-OE-1 EARLY DETECTION AND POSSIBLE REMEDIATION OF SPECIAL LEARNING PROBLEMS IN THE FIRST GRADE

Purpose: To compile a series of screening devices which would detect future learning difficulties in the elementary grades; to devise a remediation program for prevention of such learning disabilities through intensified teacher in-service training.
Subjects: 272 first grade pupils, male and female.
Methods: A battery of psychological tests was individually administered by school psychologists. Instruments included: Draw-a-Person (emotional evaluation); Copying of Gesell Figures (perceptual evaluation); Wide Range Achievement Test, Reading Part (academic evaluation); Simple Funnel Test (eye-hand-foot coordination); Inquiry Blank (overall impression through interview technique). Children with potential learning difficulties were selected by the psychologists, and a series of in-service training sessions were subsequently initiated by teams of psychologists. Evaluation teams also included teacher consultants.
Findings: Number of emotionally induced learning problems ranked highest, followed by perceptual problems and mental retardations (suspected).
Duration: 1965-1968.
Investigator(s): Rudolph F. Wagner, Ph.D., Chief Psychologist, Richmond Public Schools, 809 E. Marshall St., Richmond, Va. 23219.
Publication: Mimeographed report on initial findings available from principal investigator upon request.

21-OF-1 SCHOOL REINFORCEMENT BEHAVIOR AMONG LOWER WORKING AND UPPER-MIDDLE CLASS PARENTS OF ADOLESCENTS

Purpose: To determine possible relationships between behaviors of parents and academic achievement of their children in high school; to test hypothesis that no differences exist between school reinforcement behaviors utilized by lower working and upper-middle class parents.
Subjects: 80 parents in a Michigan community with children who are successful in secondary school.
Methods: Parents were interviewed regarding their child-rearing practices in the home as they may affect the education of their children, especially with regard to provision of educational experiences by the family, parental assistance with required homework, reading experiences outside the school, parental interest in child's school activities, family contacts with school personnel and participation in school activities for parents, methods of motivation and control of child's behavior, and parental expectations relative to child's educational achievement.

Duration: June 1965-June 1966.
Investigator(s): Stanley E. Dimond, Professor, and Alwin Coleman, School of Education, University of Michigan, Ann Arbor, Mich. 48104.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

21-OF-2 ACHIEVEMENT AND ALIENATION AMONG SIOUX INDIAN SCHOOL CHILDREN

Purpose: To define selected factors which lead to lowered educational achievement and dropout from school among Sioux Indian school children.
Subjects: Approximately 800 Indian children from 7th through 12th grades on the Pine Ridge Reservation in South Dakota; 600 white children from surrounding towns in South Dakota and Nebraska as controls.
Methods: On the basis of a pilot study and some pre-testing, a set of objective items designed to assess alienation and its components, achievement motivation, attitude toward school, and child-rearing experiences was given to subjects; a projective measure of achievement motivation was also used. On the basis of relationships among actual achievement, I.Q., and theoretical alienation scores, about 200 mothers or mother surrogates were selected for follow-up interview. White children were also evaluated for control purposes. Extensive test construction is underway using factor-analytic methods.
Findings: Achievement indices and I.Q.'s for Indian children tend to be lower than those obtained for whites, but are by no means truly severe and are usually well within normal limits. Alienation scores are consistently higher for Indian children than for white.
Duration: September 1965-November 1967.
Investigator(s): Bernard Spilka, Ph.D., Professor of Psychology, University of Denver, Denver, Colo. 80210.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Articles and possibly a monograph.

21-OF-3 EFFECTS OF ENVIRONMENTAL VARIABLES ON THE ACHIEVEMENT OF ELEMENTARY SCHOOL CHILDREN IN TRINIDAD

Purpose: To examine the relationship of educational environment in the home to school achievement; to learn whether achievement could be predicted from a knowledge of the educational environment in the home.
Subjects: 30 girls and 30 boys randomly selected from the standard IV classes of two schools in Trinidad.
Methods: Achievement, intelligence, and social background data were collected from the pupils at their school and interviews were conducted with the parents at home. Data were analyzed by means of the Pearson Product Moment Correlation, and Regression Analyses.
Findings: (1) The educational environment in the home was more closely related than the other variables to school achievement; (2) since the educational environment correlated .78 with achievement and accounted for 60 percent of the variance with respect to achievement, it was thought to be a reliable predictor.
Duration: November 1966-June 1967.
Investigator(s): Patrick B. Dyer, Ph.D., Education Officer, Ministry of Education, Trinidad, West Indies.
Cooperating group(s): University of Alberta, Canada; Government of Trinidad.
Publication: Plan to publish in Trinidad Journal of Education, and Psychology in the Schools.

21-OG-1 PROPERTIES OF THE TEACHER AS A REINFORCING STIMULUS

Purpose: To examine effects of teacher punitiveness and expertise on the efficacy of the social reinforcement emitted.
Subjects: Junior and senior high school students from two schools near Madison, Wisconsin.
Methods: Teacher behaviors were manipulated in tape recordings of a staged high school social studies class. Behaviors leading to impressions of high or low punitiveness and high or low expertise were combined into four different tape recordings (high-punitive, low-expert, high-punitive, high-expert, etc.) High school students listened to recordings, then met the teacher in person in an interview situation. Using social reinforcement (Hmm-mm, Good) teacher attempted to increase the operant rate of first person pronouns.
Findings: Expertise manipulations had no effect on efficacy of social reinforcement. Punitive teachers elicited a significantly higher rate of first person pronouns than non-punitive teachers in a control situation (no reinforcement). Non-punitive teachers elicited a significantly higher rate when using social reinforcement.
Duration: May 1965-June 1966.
Investigator(s): Thomas J. Johnson, Ed.D., Associate Professor, Washington University, St. Louis, Mo.; and Thelma Baldwin, M.S., Research Assistant, Department of Educational Psychology, University of Wisconsin, Madison, Wis.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Technical Report No. 9, Research and Development Center for Learning and Re-education, Madison, Wisconsin.

21-OG-2 ADJECTIVE CHECKLIST AND SYMPTOM CHECKLIST CORRELATES OF "SCHOOL REFUSAL"

Purpose: To evaluate teachers' assessments of personality variables and symptomatic behavior in children referred for psychiatric evaluation with the presenting problem of "school refusal."
Subjects: Children referred to the Division of Child Psychiatry for psychiatric evaluation. Half the children were referred with a presenting problem not involving academic work.
Methods: Teachers were asked to complete adjective checklist and symptom checklist for all children referred to the Division of Child Psychiatry. Correlational analysis is predicted to show (1) specific personality profile configurations for the "school refusal" group; (2) greater severity of symptoms checked for the "school refusal" group than for the controls; (3) greater frequency of negative adjectives checked for the "school refusal" group than for the controls.
Duration: April 1967-1968.
Investigator(s): Willy A. Kouw, Ph.D., Assistant Professor, Department of Neurology and Psychiatry; Douglas B. Radabaugh, Psychiatric Social Worker; and Talaat H. Mohamed, M.D., Assistant Professor and Director of Inpatient Services, Division of Child Psychiatry, University of Texas Medical Branch, Galveston, Tex. 77550.
Publication: Articles planned in educational psychology and psychiatric journals.

21-OG-3 SOME DETERMINANTS OF BEHAVIOR IN NEGRO AND WHITE BOYS

Purpose: To investigate relationships between actual classroom behavior as seen by the classroom teacher and the child's own professed interest in behaving in an acceptable fashion; to compare the classroom behavior of Negro and white boys in relation to definiteness of their boundaries; and to study the influence of the mother's attitude on the formation of the boundary of her son.
Subjects: Normal sample: 45 white boys from normal fifth and sixth grades; 30 Negro boys from normal fifth grade; 40 emotionally disturbed Negro boys of elementary school age and 16 of their mothers; 27 emotionally disturbed white boys and 11 of their mothers.
Methods: Boys are administered 20 response ink blot test (Fisher-Cleveland Instructions) and Social Desirability Scale. Mothers are tested individually. Mothers and teachers rate the boys.
Findings: There was a significant difference between mean Barrier scores of the normal white boys and the normal Negro boys. White boys scored significantly higher. There was no difference between mean Barrier scores for the disturbed white boys, disturbed Negro boys, and the normal Negro boys.
Duration: September 1966-March 1967.
Investigator(s): Rhoda Lee Fisher, Ph.D., Research Psychologist, Syracuse Public Schools, 409 Genesee St., Syracuse, N. Y.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Paper presented at Eastern Psychological Association Meeting, April 1967. Paper is available in mimeographed form presently; journal publication planned.

21-OG-4 MEASUREMENT OF CHILDREN'S SCHOOL MORALE

Purpose: To develop a conceptualization of school morale, to measure its components, and to relate it to environmental and personality factors.
Subjects: Fifth and sixth graders in Tuscaloosa, Alabama, and junior high students in Tennessee.
Methods: Likert-type scales were constructed to assess each of the following components of school morale: school plant, instruction, administration and regulations, community interest, other students, teacher-student relationships, and general school morale.
Duration: February 1967-August 1968.
Investigator(s): Lawrence S. Wrightsman, Ph.D., Professor of Psychology, George Peabody College for Teachers, Nashville, Tenn. 37203.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Possibly technical reports and journal articles.

21-OG-5 PERSONALITY STRUCTURE IN MIDDLE CHILDHOOD AND PREDICTION OF SCHOOL ACHIEVEMENT AND ADJUSTMENT

Purpose: To confirm earlier research with adults indicating that certain personality dimensions, apart from intelligence, are associated with achievement and adjustment criteria.
Subjects: 267 12-year-old boys and girls.
Methods: Performance tests of personality; factor analysis and factor extension analysis to get estimated correlations between factors and criteria, including certain home background variables.

BEST COPY AVAILABLE

Findings: Earlier research appears to be confirmed.
Duration: 1963-1966.
Investigator(s): John D. Hundleby, Ph.D., Associate Professor of Psychology, New York University, New York, N. Y. 10003; and Raymond B. Cattell, D.Sc., Research Professor, Department of Psychology, University of Illinois, Urbana, Ill. 61801.
Cooperating group(s): National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Monograph of the Society for Research in Child Development, late 1967.

21-OH-1 EDUCATIONAL VALUES IN CONTRASTING RURAL COMMUNITIES OF LOW INCOME AREAS

Purpose: To attempt to determine factors other than income in selected rural communities that account for wide variation in percentages of high school graduates who continue formal education.
Subjects: All high school students and teachers in ten communities in Kansas counties. Five of these communities send a small percentage of high school graduates on to college; five, a larger percentage. Sample also includes parents of all seniors, community leaders, and editors of local newspapers.
Methods: Questionnaires are administered to all high school students and teachers in the ten communities. These schedules include Rosenberg's Self-Esteem Scale and a 10-point scale to measure, in part, "Attitude Toward a College Education." Interviews are held with parents of all seniors in the sample, community leaders, and editors of local newspapers. These include Chapin's Social Participation Scale, and Srole's Anomia Scale. Educational news in community and school newspapers is measured and classified to compare the emphasis placed on entertainment and non-entertainment school functions and on recognition of student accomplishments.
Duration: April 1966-September 1967.
Investigator(s): Lowell Brandner, Ph.D., Professor of Technical Journalism; Joan Sistrunk, M.A., and Amy Schindler, B.A., Research Assistants, Department of Technical Journalism, College of Agriculture, Kansas State University, Manhattan, Kan. 66502.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Publication planned in education, counseling, and journalism journals.

21-OI-1 RELATIONSHIP BETWEEN DROPPING OUT OF HIGH SCHOOL AND IDENTIFICATION WITH REFERENCE GROUP MEMBERS

Purpose: To examine both the structure and processes operative in families of dropouts as perceived by them and their parents; to test hypothesis that there are certain intrafamilial characteristics which influence a youth's premature withdrawal from school.
Subjects: High school dropouts.
Methods: Examination of degree of integration of families from which dropouts come, degree of identification dropouts have with members of their families; reference groups of the dropout, values of dropout and his parents toward education and other related variables; and a comparative analysis of dropouts and those who remain in school.
Duration: Not reported-June 1968.

Investigator(s): Edward Z. Dager, Ph.D., Professor of Sociology, and Judith Bootcheck, Graduate Student, Department of Sociology, Purdue University, Lafayette, Ind. 47907.
Cooperating group(s): Purdue University Research Foundation.

21-OJ-1 PARENT EDUCATION IN POSITIVE MENTAL HEALTH

Purpose: To determine the relative effectiveness of educating mothers in principles of mental health to the degree that wholesome modifications in the behavior of their sons are noted.
Subjects: 60 mothers of six- and seven-year-old boys selected in school as having behavior problems.
Methods: First and second grade teachers in one school district recorded 15 specific aggressive behaviors of type needing improvement noted among boys in their classes in one-month period. Ninety boys with three or more critical incidents in a four-week period were identified as potential subjects. Their mothers were interviewed to determine willingness to participate in a 24-hour course of instruction in positive mental health principles and practices. The first 70 of the 90 who expressed interest and readiness to participate, and were willing to grant permission for psychological evaluation of their subject sons, became subjects. Of the 70, 60 are active subjects, and 10 are alternates to allow for attrition due to moving or otherwise dropping out. All 70 boys are evaluated by a qualified clinical psychologist in October 1966, April 1967, and October 1967. This is done "blind": the psychologist does not know who is an experimental or control subject and will have no reference to his earlier recorded appraisal in second and third studies. Teachers use a research-developed record of behaviors to be encouraged (wholesome) and behaviors to be improved (unwholesome) for one calendar year on all 70 boys. First experimental group consists of 20 chance-selected mother subjects who began a 12-session course of instruction in October 1966. A group of 40 mothers plus alternates had no course work and served as controls for six months. A second group of 20 mothers, randomly selected from among the original 60 plus alternates, are enrolled in the same course of instruction and sessions conducted from April to June. This is the second experimental group with 20 controls and alternates. A post-hoc course will be conducted in November 1967 for "controls" to comply with interests expressed in October 1966. Data will consist of psychologist's evaluation of boys at the start, midway, and end of calendar year plus positive and negative behavior in that time; October 1966 pre-test of all mothers; and post-course test for mothers at end of course. Data of primary interest will be behavior of boys with comparison of experimentals and controls on same scales, by same teachers, and same clinical psychologist.
Duration: September 1966-December 1967.
Investigator(s): Frederick A. Zehrer, Ed.D., Director, Mental Health Research Program, American Institutes for Research, Station A, P.O. Box 11487, Palo Alto, Calif. 94306.
Cooperating group(s): Cupertino Union Elementary School District, Cupertino, California; National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Written report planned.

21-OJ-2 SOCIAL-PSYCHOLOGICAL CHARACTERISTICS OF RECIPIENTS OF A PARENT DISCUSSION GROUP PROGRAM

Purpose: To investigate certain social-psychological characteristics of recipients of a community parent education program, including parents' perceptions of the program, their motivations for enrolling, their assessment of the program, and an evaluation of the impact of the program. Parents who completed the program will be compared with parent dropouts on the above variables.
Subjects: 179 parents enrolled in 19 Parent Discussion Groups during the 1963-1964 academic year.
Methods: Source of data consisted of companion questionnaires, part one administered at the beginning of the program and part two at the end. Part one contained eight items designed to elicit factual information such as age, sex, occupation, education, and nine items dealing with attendance, source of information, perceptions, and motivations. Part two contained twelve items dealing with attendance, perceptions, assessment, and impact, and ten items from the Dominating Scale of Shoben's Parent Attitude Survey. For parents who dropped out, the questionnaire was converted into an interview schedule containing the same information with the addition of three items dealing with reasons for and time of dropping out.
Findings: The program reaches young mothers with young children who are relatively well educated and quite active in community organizations. Parents viewed the program in a manner consistent with the way it had been portrayed, had reasonably clear ideas as to how they expected to benefit, and were motivated by a wide range of concerns about their children. Assessment was primarily favorable. That the program had a positive impact was seen in the self-involvement and self-modification which was stated to have taken place in a significant number of the parents.
Duration: 1963-1967.
Investigator(s): Fortune V. Mannino, Ph.D., Project Director, Mental Health Study Center, National Institute of Mental Health, 2340 University Blvd. E., Adelphi 20783; and Margaret M. Conant, Ph.D., Coordinator of Parent-Teacher Study Groups, Board of Education, Prince George's County, Upper Marlboro, Md.
Publication: Maryland Parent-Teacher, March 1967. Other reports to be submitted to professional journals.

21-OJ-3 THE EFFECT OF PARENTAL INVOLVEMENT ON THE SCHOOL SUCCESS OF YOUNG CULTURALLY DEPRIVED CHILDREN

Purpose: To assess effect of parental involvement in schooling of young deprived children; to compare this effect with effect of planned curriculum change.
Subjects: Parents of 20 entering kindergarten children.
Methods: Children are selected utilizing previously determined sociological and psychological variables. Small parent education and discussion groups.
Duration: November 1966-September 1967.
Investigator(s): James L. Olson, Ed.D., Associate Professor, University of Wisconsin, Milwaukee 53211; and Richard G. Larson, M.A., Assistant Curriculum Coordinator, Unified School District No. 1, Racine, Wis.
Cooperating group(s): Johnson Foundation, Racine, Wis.
Publication: Articles planned for appropriate educational journals.

21-OK-1 SCHOOL DESEGREGATION VIA COMPULSORY PUPIL TRANSFER: ITS IMPACT ON ELEMENTARY SCHOOL PUPILS

Purpose: To evaluate compulsory bussing to overcome de facto segregation: its initial impact on academic, personal, social, and emotional characteristics of young children.
Subjects: About 3,000 elementary pupils, including those transferred from a school closed because of de facto segregation, and those attending schools to which the former were transferred.
Methods: Special testing of pupils, using a variety of instruments (parent interviews, etc.) in a three-phase program producing data (1) prior to the school closing, (2) within a month of accomplished transfers, and (3) at end of first post-transfer school year.
Duration: May 1965-September 1967.
Investigator(s): Patricia M. Carrigan, Ph.D., Director of Research, Ann Arbor Public Schools, 1220 Wells St., Ann Arbor, Mich. 48104.
Cooperating group(s): New World Foundation; University of Michigan Institute for Social Research; Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Results to be reported to granting agencies and in professional journals.

21-OK-2 EFFECTS OF OCCASIONAL INTERRACIAL VISITS ON PUPILS' ATTITUDES

Purpose: To determine effects on attitudes of moving white pupils to Negro schools, or Negro pupils to white schools for a one-day visit.
Subjects: Several thousand elementary and high school pupils in Chicago area schools.
Methods: At the initiative of teachers, principals, district superintendents, or even students, visits from one school to another in the Chicago metropolitan area take place to study common subject matter, to share experiences, to listen to each other's songs or poetry, to report on school studies or projects.
Findings: Teachers and students are developing more realistic knowledge of the greater Chicago metropolitan area. Attitude changes appear minimal.
Duration: September 1963-1968.
Investigator(s): Morris L. Haimowitz, Ph.D., Director; George Ricks, Ph.D., Assistant Director; and Dan Muller, M.A., Staff Member, Bureau of Human Relations, Chicago Public Schools, 228 N. LaSalle St., Chicago, Ill. 60602.

Specific Skills

21-PA-1 DEVELOPMENTAL ASPECTS OF THE CONCEPT OF ADDITION

Purpose: To identify relevant variables which affect the formation of the concept of addition of whole numbers in first grade children.
Subjects: First grade children selected at random from large populations.
Methods: Administration, individually, of tests which describe cognitive characteristics which affect the formation of the concept of addition of whole numbers.
Findings: Significant variables which affect concept formation of addition are: (1) action in the problems vs. no action; (2) presence of aids vs. absence of aids; (3) terminology used to describe sets involved in an addition problem; (4) lack of children's ability to apply knowledge of addition facts to physical situations; (5) conservation of numerousness; and (6) I.Q.

Duration: 1964-completed.
Investigator(s): Henry Van Engen, Ph.D., Professor of Education and Mathematics, and Leslie P. Steffe, Ph.D., Research Associate, Research and Development Center for Cognitive Learning, University of Wisconsin, Madison, Wis. 53706.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Technical Reports Nos. 4, 5, and 21, Research and Development Center for Cognitive Learning.

21-PA-2 THE PROBLEMS OF UNDERACHIEVEMENT AND LOW ACHIEVEMENT IN MATHEMATICS EDUCATION

Purpose: To test the abilities of a selected group of underachievers and low achievers from grades four to six to function on three levels of the concrete-abstract continuum in the conceptual areas of linear measurement and place value; to make an intensive analysis of each student using the case study technique.
Subjects: 12 underachievers and 11 low achievers in mathematics from grades four to six.
Methods: Tests on different abstract levels were administered to each student to determine his ability to function on different levels. Psychological and sociological data were obtained from observation, teacher and parent interviews, cumulative records, California Test of Personality, and Wechsler Intelligence Scale for Children.
Findings: The ability to function on different abstract levels of the mathematics was not a function of whether the student was a low achiever or an underachiever. No consistent pattern was evident; hence, this appears to be an individual student problem. The underachiever of this study comes from an unstable home which is centered around high achievement. The home places excessive stress on school grades and college preparation. When the underachiever of this study was confronted with high anxiety situations, his performance was lowered considerably. The low achiever in this study has personal and social adjustment problems, poor family relationships, and bad school behavior. His academic development is below par.
Duration: September 1965-November 1966.
Investigator(s): Dwain E. Small, Ed.D., Associate Professor of Education, University of Florida, Gainesville, Fla. 32603.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Report submitted to Office of Education.

21-PB-1 PROGRAMMED TUTORING OF ELEMENTARY READING

Purpose: To develop a teaching technique for beginning reading to be used as a supplement to classroom teaching and as a research tool for further studies relevant to the teaching of reading.
Subjects: Various levels of retardates in Fort Wayne, Ind., State School and in public school systems of Fort Wayne, Bloomington, and Indianapolis. Major field testing with lower third of first grade classes in inner city school in Indianapolis.
Methods: Principles of programmed instruction are applied to the "programming" of tutors instead of teaching machines. Technique is adaptable to any basal reading series. Non-professional (i.e., high school education only) tutors are used.

Findings: Programmed tutoring appears highly effective, particularly with children who are generally regarded as "slow learners" or "slow starters."
Duration: 1960-1970.
Investigator(s): Douglas G. Ellson, Ph.D., Professor of Psychology, Indiana University, Bloomington, Ind. 47401.
Cooperating group(s): Ford Foundation; National Institute of Child Health and Human Development and National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Reading Research Quarterly 1:1:77-127, Fall 1965; other interim and final reports and articles are planned.

21-PB-2 FIRST GRADE READING INSTRUCTION

Purpose: To test hypotheses that there will be no significant difference in change in reading achievement level of pupils (1) who are low, average, or high in reading readiness, or (2) who come from low, average, or high socio-economic groups, who are subjected to a non-graded reading program and pupils who are subjected to the developmental basal reading program.
Subjects: Approximately 800 first grade pupils of Asheville, N. C. city schools.
Methods: Non-graded and developmental basal reading programs were used. Reading achievement level was measured by Gates Reading Readiness Test, administered in September 1965, and Gates Primary Reading Readiness Test, administered in May 1966. A between-group comparison to test each hypothesis will be made by utilizing the Student's "t" test for independent groups. A two-tailed test of significance utilizing the .05 level of confidence will be applied.
Duration: Not reported.
Investigator(s): Dr. R. E. Robinson, Department of Instruction, Asheville City Schools, Box 7347, Asheville, N. C.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

21-PB-3 PREVENTIVE MEASURES TO REDUCE READING RETARDATION IN THE PRIMARY GRADES

Purpose: To investigate the effectiveness of specialized reading instruction and in-service education as a supplement to classroom instruction for second grade low-reading groups.
Subjects: Second grade children in Cedar Rapids public schools who have been qualified as slow readers as determined by a cumulative score on the beginning-of-the-year reading achievement test, and whose Lorge Thorndike is 85 or above.
Methods: Three major methods groups are established with ten classrooms using each method. One group is the Basal Reader group (BR), another the Basal Reading In-Service Training group (BRIT), and the third the Supplemented Basal Reading In-Service Training group (SBRIT), which is divided into two sub-groups: SBRIT-2 and SBRIT-1. SBRIT-2 special group children are matched individually with SBRIT-1 children within each classroom according to age, I.Q., and degree of reading retardation. SBRIT-2 children share same program and teacher with SBRIT-1 children. In addition, SBRIT-2 children receive approximately 30 minutes per day of individual and small group (2-3 children) reading instruction outside the classroom. Beginning and end-of-year score comparisons are made between reading achievement scores of two major methods groups (BR and BRIT) and SBRIT and two groups identified for subsequent comparisons that were above cut-off points on September test using analysis of variance.

Duration: August 1965-June 1966.
Investigator(s): Hale C. Reid, Director of Reading Research, Cedar Rapids Public Schools, Cedar Rapids, Iowa.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

21-PB-4 A PLAN FOR IMPARTING BILINGUAL SKILLS TO MONOLINGUAL SPEAKERS OF HAWAIIAN PIDGIN IN THE KINDERGARTEN, FIRST, SECOND, AND THIRD GRADES, THROUGH LINGUISTICALLY ORIENTED PEDAGOGICAL TECHNIQUES

Purpose: To test the effects of materials and methods based on the TESL (Teaching English as a Second Language) audiolingual approach on small children who come to school as monodialectal speakers of a non-standard variety of English. The dependent variable is oral speech proficiency. Independent variables are mental maturity, and scholastic achievement in several areas.
Subjects: Children in kindergarten through grade three of the Keaukaha School, 90 percent of whom are residents of homes on Hawaiian Homes Commission lands, and whose speech patterns are homogeneous.
Methods: Contrastive Linguistic Analysis is used to determine phonological and grammatical patterns not in the children's native dialect. These patterns are embedded in episodes, or lessons, in a sequential and cumulative fashion, for presentation to the children through a demonstration-practice pedagogical procedure. Classroom teachers are apprised of results of the Contrastive Linguistic Analysis, process of lesson writing, and best techniques for demonstration-practice procedure, including ways of transferring targets out of the lesson materials into spontaneous and real life language expression. Developing speech patterns of the children are sampled twice each school year and subjected to the criterion measure, a newly developed instrument for rating oral proficiency.
Findings: Preference as friends is correlated with ability in standard oral English. Mental maturity (CTMM) scores increased an average of 10 points for 1965-1966 third graders over their 1964-1965 scores. Oral proficiency can be measured and fine distinctions made.
Duration: September 1965-October 1969.
Investigator(s): Dale P. Crowley, M.S., Education Officer, State Department of Education, P.O. Box 1922, Hilo 96720; and Howard P. McKaughan, Ph.D., Associate Dean of the Graduate Division, and Director, Pacific Asian Language Institute, University of Hawaii, Honolulu, Hawaii 96804.
Cooperating group(s): Hawaiian Homes Commission of the State of Hawaii; Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Final report at completion of project.

21-PB-5 PRE-SCHOOL PREDICTION OF LATER SPECIAL READING DISABILITY

Subjects: Pupils entering first grade.
Methods: Children are given tests thought to be predictive of future reading disability. They will be followed through grade school and their reading ability assessed at intervals. Correlation between reading ability and tests will be made at a later date.
Duration: February 1966-indefinite.
Investigator(s): John B. Isom, M.D., Associate Professor of Pediatrics and Neurology, University of Oregon Medical School, Portland, Ore. 97201.
Cooperating group(s): United Health Foundation, Inc.; Office of Education, U. S. Department of Health, Education, and Welfare.

21-PB-6 NATIONAL STUDY OF WORD-BLIND CHILDREN

Purpose: To investigate incidence and nature of severe, specific reading disabilities in young children and to relate them to the mother's personal and social history, as well as to the child's own history, including events just prior to and during his birth.
Subjects: All those children taking part in the National Child Development Study (1958 cohort) who, at age seven, were unable to read despite the fact they they are thought to be of normal intelligence.
Methods: A detailed examination will be made of the data on the above sample.
Duration: October 1966-December 1967.
Investigator(s): A. Sen, Ph.D., Senior Research Officer, National Bureau for Co-operation in Child Care, Adam House, 1 Fitzroy Square, London, W.1., England. (Reported by M. L. Kellmer Pringle, Ph.D., Director, National Bureau for Co-operation in Child Care.)
Cooperating group(s): Financed by a grant from the Children's Research Fund.
Publication: Probably in *Studies in Child Development*, National Bureau for Co-operation in Child Care.

21-PB-7 A LONGITUDINAL STUDY OF BOYS ENROLLED IN THE SCHOOL IN ROSE VALLEY, MOYLAN, PENNSYLVANIA, BETWEEN 1930 AND 1948, FOR COMPARISON OF THE EDUCATIONAL AND VOCATIONAL CAREERS

Purpose: To test the hypothesis that dyslexic boys, so diagnosed between the ages of 6 and 12, have necessarily poorer prospects for success in higher education and vocational achievement than have non-dyslexic boys.
Subjects: 56 boys; all of those enrolled in a single private elementary school for normal children for three years or more during the years 1930-1947; boys and/or close kin interviewed in 1964-1965. Range from very high language to extreme dyslexia.
Methods: Record search, interviews, data analysis by IBM processing, and statistical analysis; comparison of individuals and groups ranked by age and by language learning facility related to dyslexia, as defined by Orton and successors; comparison on several variables, including educational achievement and vocational status at time of follow-up; incidental studies of socio-economic background; childhood Binet I.Q.'s of dyslexics and non-dyslexics, with pairs of subjects matched for life histories and adult accomplishments; analysis of pairs and trios of siblings.
Findings: Data processing and analysis completed with respect to major objectives: 20 boys judged highest in childhood language learning facility relative to dyslexia patterns had completed 5.4 years of college and graduate school work; 16 boys of medium facility had completed 5.7 years higher education; 20 moderately to severely dyslexic subjects achieved 6.0 years; differences in vocational status in same order. These differences were statistically non-significant; thus, the hypothesis was rejected.
Duration: October 1964-completed.
Investigator(s): Margaret B. Rawson, M.A., Reading Consultant, Montgomery County Easter Seal Treatment Center, 1000 Twinbrook Parkway, Rockville, Md.
Cooperating group(s): Easter Seal Research Foundation, National Society for Crippled Children and Adults, Chicago, Ill.; Hood College, Frederick, Md.
Publication: *Academic Therapy Quarterly* 1:3, 1966; *Bulletin of the Orton Society* 5:16, 1966. *Hood College Monograph No. 2* planned in 1967.

21-PB-8 AN EXPERIMENTAL READING PROGRAM FOR EXCEPTIONAL CHILDREN

Purpose: To establish a reading program for exceptional children to develop a 155-word basic sight vocabulary. Reading program utilizes programmed lessons presented on a teaching machine. Focus of program is on getting the child ready to read while he is actually learning to read.
Subjects: 26 subjects divided into four groups: (1) neurologically impaired, (2) educable mentally retarded, (3) emotionally disturbed, and (4) autistic.
Methods: Program procedures consisted of a five-part lesson based upon words introduced in each chapter of the Ginn Basic Readers. For correct responses the subject was given an extrinsic reward, at first on a continual basis and later on a periodic basis. Words were introduced and reviewed as follows: (1) visual discrimination of new words, (2) auditory discrimination of new words, (3) readback of the new words, (4) visual recall of new words, and (5) phrase reading. At first, reinforcement was given on a continuous basis (1:1) and later on a 1:5 ratio. In addition to the tangible rewards, the child was given a token reward for each correct response. Ultimately, a 1:200 ratio was established.
Findings: A record was kept of all subject responses, and progress was ascertained by means of correct response rate and total responses per minute. Data indicated that presence or absence of candy as a reward had no significant effect on subject's functioning. A "take-away" condition had no significant difference in correct responses. Amount of time given to an educable mentally retarded child appeared to increase the correctness of responses.
Duration: July 1963-continuing.
Investigator(s): Frank M. Hewett, Ph.D., Assistant Professor of Education and Medical Psychology; Donald Mayhew, M.A., and Ethel Rabb, M.A., Teachers, Neuropsychiatric Institute School, University of California, Los Angeles, Calif. 90024.
Publication: American Journal of Orthopsychiatry 37:35-48, 1967.

21-PB-9 THE EFFECTIVENESS OF EMPHASIZING READING SKILLS IN AN ENGLISH COURSE FOR UNDERACHIEVERS

Purpose: To study an adjusted English curriculum designed for children who are not achieving in accordance with their intellectual potential; to investigate the effectiveness of emphasizing reading skills as part of an English curriculum with a consequent de-emphasis in English content.
Subjects: Three matched groups of children who are not achieving in accordance with their intellectual potential.
Methods: One group is instructed in reading skills; another group is given English instruction adjusted to the academic underachiever, and the third is included within regular English classes. Pre- and post-assessments will be made in reading, grammar, essay writing, and attitudes, and the three groups will be compared in these areas after one academic year.
Duration: Not reported.
Investigator(s): Robert Emans, Temple University, Philadelphia, Pa.; Raymond S. Urbas, Staff Psychologist, Milwaukee Public Schools, Milwaukee; Helen Johnson, Teacher, and Eugene Lynch, Director of Instruction, West Bend Public Schools, West Bend, Wis.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

21-PB-10 LETTER SOUNDS AS HEARD BY BILINGUALS

Purpose: To ascertain desirability of different introductory words in beginning readers for Spanish-speaking children.
Subjects: 50 experimental and 50 control pre-school children.
Methods: Children indicate whether combination letter sounds, that do not spell or say anything, sound alike or not.
Duration: Summer 1966-1967.
Investigator(s): Marion Cline, Ed.D., Associate Professor of Education, Texas Western College, El Paso, Tex. 79999.

21-PD-1 ABILITY OF CERTAIN PUPILS TO UNDERSTAND AND APPLY SELECTED CONCEPTS AND GENERALIZATIONS IN GEOGRAPHY

Purpose: To determine (1) whether culturally advantaged primary grade children are able to understand and apply geographic concepts and generalizations; (2) whether these concepts and generalizations can be best understood and applied through instruction involving inductive, deductive, or intuitive approaches; and (3) which primary grade is most appropriate to begin this type of program.
Subjects: Approximately 300 primary grade children from a high socioeconomic suburban community in the northeastern United States.
Methods: Learning experiences are designed to include inductive, deductive, and intuitive approaches to the development of understanding and application of the selected concepts and generalizations. A criterion test has been constructed. Subjects in experimental group are pre-tested, exposed to one of the three types of instructional approaches, and post-tested. Subjects in control groups are pre- and post-tested. Analysis of covariance test is applied to determine if significant differences exist among independent variables, three methods of instruction, grade level, sex, and the dependent variable, post-test scores. Pre-test scores and intelligence test scores are used as covariates.
Duration: Not reported.
Investigator(s): Richard C. Wallace, Jr., Ed.D. Candidate, Boston College, Chestnut Hill, Mass. 02167.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

Special Education

21-QB-1 AN EXPERIMENTAL JUNIOR HIGH SCHOOL

Purpose: To attempt to adapt the curriculum of an experimental school to the interests and abilities of students who have been nominated by their teachers as potential dropouts.
Subjects: 45 students from a Minneapolis junior high school.
Methods: The experimental junior high school is located in an old printing shop several blocks from its parent school. Students are taught by a faculty of seven.
Duration: 1964-continuing.
Investigator(s): R. W. Faunce and Bonnie J. Murton, Youth Development Project, Chicago at Sixth St., Minneapolis, Minn. 55415. (Reported by NCCD. See Note, p. 73.)

Cooperating group(s): Minneapolis Public Schools; Community Health and Welfare Council of Hennepin County; Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare; U. S. Office of Economic Opportunity.

21-QC-1 THE FAIRFAX PLAN--A WORK-STUDY PROGRAM FOR THE RETARDED

Purpose: To evaluate effects of work-study program (WSP) at secondary school level for borderline and mildly mentally retarded youths by identifying variables which contribute to relationship between curriculum content, response to training, and adequacy of job performance.
Subjects: 200 experimental and 75 control subjects, both sexes, 15 to 18 years in chronological age, 60 to 84 in WAIS or WISC I.Q., with academic achievement three or more years below grade level placement.
Methods: WSP objective is to train youths for employment by providing specialized curriculum, vocational counseling prior to leaving school, varied pre-vocational work experiences, and workership skills that increase ability to adapt to changing occupational demands as opposed to specific training aimed toward early development of occupational specialty. Experimentals are enrolled in WSP and controls in regular high school program. Twelve tests or rating scales are administered in battery which includes measures of intelligence, academic achievement, social and emotional maturity, visual-motor coordination, vocational interest, knowledge, and capacity, and subjective response to program. Design is of repeated measurements type. Specific questions are aimed at determining degree to which WSP results in graduates having significantly different (1) levels of academic achievement, (2) adjustment in social and emotional areas, (3) attitudes toward employment, (4) habits of work performance, and (5) levels of economic self-sufficiency when compared to controls and WSP dropouts.
Duration: January 1966-December 1968.
Investigator(s): Bernard J. Cameron, M.S., Director of Research, Work-Study Program for the Retarded, Fairfax County School Board, 10515 School St., Fairfax, Va. 22030.
Cooperating group(s): Virginia Department of Vocational Rehabilitation; Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.
Publication: Two progress reports, July 1966 and February 1967, include results and analyses of trends in data and are available by writing principal investigator; other reports at approximately six-month intervals.

21-QC-2 EFFECTS OF "EXTRA" SPECIAL EDUCATION ON MENTALLY RETARDED AND SLOW-LEARNING CHILDREN

Purpose: To develop creative and divergent thinking in retarded and slow-learning children, to re-motivate interest in learning, and to involve parents in program for back-up.
Subjects: 30 mentally retarded and slow-learning children, I.Q.'s 50 to 85.
Methods: Small classes of six children each are held for three hours a week over and above regular special class. Material is oriented toward high interest and individualized for each child.
Findings: Improvement in grades in all subjects, general personality improvement (more gregarious and socially oriented), and more interest of parents noted by attendance at conferences.
Duration: February 1966-June 1968.

Investigator(s): Lawrence H. Weiner, Ed.D., Director of Special Education, Barrington Public Schools, 217 Lincoln Ave., Barrington, R. I. 02806.
Publication: Digest of Mental Retardation 3:1:8-11, Fall 1966; presented at Council of Exceptional Children Conference, St. Louis, 1967.

21-QC-3 RELATIONSHIP OF VOCATIONAL OUTLOOK AND SPECIAL EDUCATIONAL PROGRAMS FOR ADOLESCENT EDUCABLE MENTALLY HANDICAPPED

Purpose: To investigate the relationship between vocational outlook of high school educable mentally handicapped (EMH) students and the type of high school programs in which they were found.
Subjects: 373 EMH students, 202 males and 171 females, ages 13 to 21, attending 32 special classes in Illinois high schools.
Methods: Vocational outlook of EMH students was measured by a Could You Ever scale, a group test constructed for this study. School programs were rated on a Program Criteria Index. Data were collected from school records on each student's age, sex, race, I.Q., reading achievement level, work experience history, father's occupation, and father's educational level. Non-parametric techniques (rank correlation and chi-square) were utilized in analysis of data.
Findings: Rank correlations failed to reveal relationships between vocational outlook of the students and nature of the program in which they were enrolled; additional findings.
Duration: February-August 1966.
Investigator(s): Philip R. Jones, Ed.D., Director of Special Services, Champaign Community Unit 4 Schools, 705 South New St., Champaign, Ill. 61820.
Publication: Limited copies of report available from investigator for $3.00, from University Microfilms, or ERIC Clearinghouse on Exceptional Children.

21-QD-1 PREVENTION THROUGH EARLY DETECTION IN HIGH HAZARD AREAS

Purpose: To develop an in-service program focusing upon behavioral manifestations; to provide an objective clear basis for referral for treatment; and to evaluate treatment modalities.
Subjects: 61 pupils from five parochial schools in central Harlem, referred to a child guidance clinic, and 28 teachers.
Methods: Treatment modalities which contrasted the traditional parent and child scheme with parent only, child only, and control groups, were established in a school setting.
Findings: Based on attitudinal and informational questionnaires, a significant change in attitude toward acting-out and withdrawn behavior was found; reliable differences among the four treatment groups were found on selected psychological dimensions.
Duration: September 1964-August 1966.
Investigator(s): John F. Walsh, Ph.D., Director of Research; Rita D'Angelo, Ph.D., Director of Education; and Thomas Brockbank, M.D., Staff Psychiatrist, Catholic Charities Guidance Institute, 122 E. 22nd St., New York, N. Y. 10010.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Paper presented at Eastern Psychological Association meeting, April 1967; copies available from Catholic Charities Guidance Institute.

21-QD-2 EDUCATION OF BEHAVIORALLY DISORDERED CHILDREN IN THE PUBLIC SCHOOL SETTING

Purpose: To develop effective and economical methods whereby behavioral problems and academic deficiencies of behaviorally disordered children can be remediated within a special class setting in a public school.
Subjects: Children, ages six to ten, referred because of behavior disorders.
Methods: Three classes will be operated in collaboration with a local public school in which methods and techniques, following generally from reinforcement and social learning theory, can be tested. Concurrently studied will be techniques in behavior modification, curriculum development, and instructional methods.
Duration: June 1966-May 1970.
Investigator(s): Herbert C. Quay, Ph.D., Research Director, Children's Research Center, and Professor of Psychology, and Larry K. Brendtro, Ph.D., Assistant Professor of Special Education, University of Illinois, Urbana, Ill. 61801.
Cooperating group(s): Urbana Public Schools; Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Exceptional Children 32:509-515, 1966.

21-QD-3 "NO WALLS TO CLIMB": ADJUSTING THE SCHOOL PROGRAMS IN THE PRIMARY GRADES FOR CHILDREN WITH PSYCHOLOGICALLY BASED LEARNING PROBLEMS

Purpose: To aid primary teachers in identification of children whose psychological problems impair their ability to learn.
Subjects: 12 children.
Methods: Meetings with teachers of primary children; gathering of related data, including annotated bibliography.
Duration: 1964-completed.
Investigator(s): Zelma Parker, M.S.W., Guidance Consultant; Alice McMaster, M.A., Curriculum Consultant; and Phyllis Brislawn, M.A., (formerly) School Psychologist, Sheldon School District, Contra Costa County Department of Education, 75 Santa Barbara Rd., Pleasant Hill, Calif.
Publication: Probably December 1967.

21-QE-1 SUPPORTIVE INTERVENTIONS FOR HIGHER EDUCATION AMONG STUDENTS OF DISADVANTAGED BACKGROUNDS

Purpose: To increase supply of high school and college graduates and leaders who come from severely disadvantaged backgrounds; to test hypothesis that significant modification in educational behavior of students is related to amount and type of supports provided by extra-school groups.
Subjects: Three panels of 57 to 75 seventh and eighth graders, one each in the summers of 1964, 1965, and 1966.
Methods: Subjects attend a six weeks residential program of curricular and co-curricular supports in English, science, social science, and mathematics. The major goal of this residential program is one of enrichment and stimulation for further academic work. Residential program is followed with a continuing flow of curricular and advisory-informational supports through graduation from high school, to encourage talented individuals to complete plans for higher education. In the experimental design a randomly chosen set of students, an equivalent set of unchosen students from the same schools, and a matched and/or equivalent set of students from uninvited schools of similar type are compared. Third

group of students from uninvited schools will allow assessment of amount of "contamination" within "treated" schools. All groups will be followed for five years. A series of measures will be employed to assess utility of predictive measures involved in selecting "talented" students, involving both academic performance and attitude and self-conception measures.
Duration: Not reported.
Investigator(s): J. Milton Yinger, Professor of Sociology; Kiyoshi Ikeda, Assistant Professor of Sociology; Frank Laycock, Professor of Education; and John M. Antes, Assistant Professor of Education, Oberlin College, Oberlin, Ohio.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Childhood Education 43:6:370, February 1967.

21-QE-2 AN INVESTIGATION OF THE EFFECTS OF MONTESSORI PRE-SCHOOL TRAINING ON PERCEPTUAL AND COGNITIVE DEVELOPMENT OF DISADVANTAGED CHILDREN

Purpose: To assess effects of Montessori pre-school kindergarten training on perceptual and cognitive developmental patterning of disadvantaged children.
Subjects: Disadvantaged children from pre-school years into early primary grades.
Methods: Longitudinal evaluation of a Montessori-trained versus non-Montessori-trained population, where training effects will be compared at successive age/developmental levels and differing stages of training. There will be a specific investigation of training effects with respect to perceptual-visual and visual-motor abilities, patterns of intellective function (general intelligence and behavior characteristics relating to concentration, persistence in problem-solving, achievement set), and reading readiness and achievement patterns.
Duration: Not reported.
Investigator(s): Barbara Berger, Ph.D., Research Associate, Center for Urban Education, 33 W. 42nd St. and Alan Cohen, Ph.D., Assistant Professor of Education, Yeshiva University, 55 Fifth Ave., New York, N. Y.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

21-QE-3 INTELLECTUAL STIMULATION OF CULTURALLY DEPRIVED INFANTS

Purpose: To test hypothesis that the relatively low I.Q.'s of slum children when they enter school at age six are due to cultural deprivation rather than to heredity, and that the effects of this cultural deprivation can be counteracted by systematic intellectual stimulation in the form of a home tutoring program.
Subjects: Experimental and control groups, each composed of 30 male Negro infants, ages 15 months to 3 years, all from slum areas.
Methods: Subjects are evaluated at 14 months, prior to tutoring. From 15 to 36 months, infants in the experimental group are visited by staff members for one hour a day, five days a week. Staff members try to stimulate infants by talking to them, playing games, using toys, taking them on trips, etc. Chief emphasis is on linguistic training. Infants in both groups are tested again at 21, 27, and 36 months to determine if, when, and in what specific abilities differences between groups emerge. The Bayley tests are used for the younger children, and the Stanford-Binet for the older ones. Data are collected on the course of intellectual, social, and emotional development of the child and on his social and cultural environment to determine the sequence and correlates of intellectual growth.

Findings: Preliminary results, though tentative, suggest confirmation of the hypothesis. The tutored experimental infants seem to do significantly better than the untutored control group.
Duration: September 1965-August 1968.
Investigator(s): Paul H. Furfey, Ph.D., Co-Director, Bureau of Social Research, Catholic University of America, Washington, D. C. 20017.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Possibly a preliminary report; final report expected late in 1968.

21-QE-4 A PROJECT TO INCREASE THE PROPORTION OF YOUNG PEOPLE IN LOCAL SCHOOLS WHO CONTINUE THEIR EDUCATION BEYOND HIGH SCHOOL

Purpose: To engage young people in a disadvantaged area in educational programs best suited to their interests and potentialities; to evaluate program in terms of higher education and post-high school employment.
Subjects: Students in a disadvantaged area in Philadelphia plus a random set of controls from local schools.
Methods: Demographic data are collected on all subjects and controls. Comparison of changes in academic behavior are made between subjects and controls, and there is extensive record-keeping on activities of all members of the project.
Findings: The grade point average of girls who had contact with the program improved significantly over the course of the school year, while that of the controls did not.
Duration: June 1965-June 1968.
Investigator(s): David Nowlis, Ph.D., Assistant Professor, Bryn Mawr College, Bryn Mawr 19010, and Consultant, and Susan D. Shubin, M.S.S., Director of Research, Threshold Program, Friends Neighborhood Guild, 703 N. Eighth St., Philadelphia, Pa. 19123.
Cooperating group(s): Rockefeller Foundation; Carnegie Foundation.
Publication: Data and results available from Mrs. Susan D. Shubin.

21-QE-5 INTENSIVE LANGUAGE INSTRUCTION, EXPERIENTIAL DEVELOPMENT, AND GUIDANCE PROJECT--"HIGHER HORIZONS 100"

Purpose: To demonstrate, through an experimental center at ninth grade level, the effect of compensatory services upon disadvantaged pupils possessing reasonable academic potential but deficient in language skills.
Subjects: 96 pupils, approximately equal number of boys and girls, and whites and non-whites, selected for emotional stability, at least average mental ability, and performing below norm in reading and English language functions.
Methods: Pupils were placed in a self-contained unit and were scheduled as a group for intensive English, civics, and general science. One period each day was allocated to team planning and individual pupil conferences or remediation; another period was shared on alternate days by a reading and a speech specialist. The sixth period was allocated to a non-group academic elective. In addition, pupils were involved in a highly correlated cultural exposure together with the intensive services of an assigned counselor.
Findings: Adjustments are required in the selection of students and organization of the program for coming years; there were no appreciable changes in measured I.Q. scores during the first year; there was a significant improvement in measured reading achievement, writing skills, and academic achievement test scores.

Duration: September 1965-indefinite.
Investigator(s): Robert J. Nearine, Ed.M., Coordinator of Evaluation, Hartford Board of Education, 249 High St., Hartford, Conn. 06103.
Cooperating group(s): State of Connecticut.
Publication: Data available in mimeographed form from Research and Publication Department, Hartford Board of Education.

21-QE-6 PARENTS' PERCEPTION OF HEAD START

Purpose: To determine parents' perception of Head Start aims and goals, and parent participation in Head Start at the end of the January 1966 semester.
Subjects: 50 parents randomly selected from the Milwaukee area. All parents had one or more children enrolled in Head Start Centers.
Methods: Two school social workers conducted individual interviews with parents in their homes. A structured interview technique was employed. Responses to a questionnaire were classified into reasons given for enrollment of children, degree of parent involvement, parents' perception of help given the child and family, and parents' suggestions for improving the program.
Findings: Parents were mainly motivated by education and socialization goals for their children; they participated to a limited extent in the program; they apparently lacked initiative to involve themselves in it; and they considered the program "child-centered" rather than "family-centered."
Duration: January-February 1966.
Investigator(s): John R. Belton, Ed.D., Supervisor of Educational Research, and Sidney Goldberg, M.S., School Social Worker, Milwaukee Public Schools, 2525 W. Van Beck, Milwaukee, Wis. 53211.
Publication: Copies of summary report are available from authors.

21-QE-7 EVALUATION PROGRAM: READINESS CENTER DEMONSTRATION PROJECT

Purpose: To evaluate the effectiveness of a pre-school program for children from culturally different home environments.
Subjects: Pre-school children from lower socio-economic homes whose older siblings have had a history of school failure.
Methods: In 1966 and 1967 35 children were involved in two kindergarten programs. A control group was observed. Prior to, during, and after involvement, all children are assessed medically, psychologically, and educationally. School will be discontinued in 1968, but the children will be followed longitudinally for 10 years.
Findings: Range of Binet scores in experimental group increased following treatment. Although mean scores were significantly highest (.01) for the control group during 1966, differences were not present when same children were re-tested in 1967.
Duration: 1966-1968.
Investigator(s): Jay K. Bishop, Associate Professor of Educational Psychology, and Beverly R. Cutler, Associate Professor of Education, University of Alberta, Edmonton, Alberta, Canada. (Reported by Neil M. Purvis, Acting Head, Department of Elementary Education, University of Alberta.)
Cooperating group(s): National Council of Jewish Women; Junior League of Edmonton; Edmonton Welfare Council.
Publication: *Interim Evaluation of the Readiness Center of Edmonton*, University of Edmonton, September 1967; report by Early Childhood Education Council of Alberta Teachers Association, Fall 1967.

21-QE-8 AN EVALUATION OF DIFFERENCES AMONG DIFFERENT CLASSES OF HEAD START PARTICIPANTS

Purpose: To study possible differences among three different groups of parents of children eligible for Head Start programs.
Subjects: 52 families in which the children were enrolled in Head Start through the parents' own initiative; 35 families which enrolled the child in Head Start, but only after they had been contacted personally by the study staff; 29 families who failed to enroll their children in Head Start, even after the personal contact with study staff; and 30 middle class families who had children of Head Start age or younger who had no previous school experience.
Methods: Standard measures of intelligence and school readiness. Original questionnaire measuring parental aspirations, parental awareness of the community, nature of the children's toys, and quality of living accommodations.
Findings: Children of parents who are self-referred to Head Start perform significantly better than do other disadvantaged groups on tests of verbal skills but not as well as middle class children who are a year younger. Parents in this self-referred group are more aware of facilities in the community, more apt to have books and more living space at home than other disadvantaged groups. Parents who were sought after in this study but whose children did not participate in Head Start scored lowest in these areas and were least likely to have the same aspirations for their children as middle class parents. Differences between the self-referred group and the sought after parents whose children did participate were vastly reduced by the end of program.
Duration: January-August 1966.
Investigator(s): Douglas Holmes, Ph.D., Director of Research, and Monica Bychowski Holmes, Ph.D., Project Director, Research Department, Associated YM-YWHA's of Greater New York, 33 W. 60th St., New York, N. Y. 10023.
Cooperating group(s): U. S. Office of Economic Opportunity.
Publication: Mimeographed final report available upon request from the Research Department of the Associated YM-YWHA's of Greater New York.

21-QG-1 SUMMER WORK-STUDY PROGRAM FOR HIGH SCHOOL STUDENTS

Purpose: To investigate factors associated with selection of mental health careers, and to determine whether summer placements in mental health agencies facilitate entrance of individuals into mental health careers.
Subjects: 240 high school juniors and seniors.
Methods: Half the students are provided with an integrated 10-week academic work experience in mental health for five summers while remaining 120 students are not involved in mental health work. Both groups are tested with various attitude, value, and personality measures and are followed up for seven years into the selection of a career.
Duration: June 1966-September 1972.
Investigator(s): Richard A. Pasewark, Ph.D., and Hugh B. McFadden, Ph.D., Professors of Psychology, University of Wyoming, Laramie 82070; and B. J. Fitzgerald, Ph.D., Director of Psychological Services, Wyoming State Hospital, Lander, Wyo. 82520.
Cooperating group(s): Wyoming State Training School; Veterans Administration Hospital (Sheridan); National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Yearly reports to National Institute of Mental Health.

21-QG-2 THE BRIDGEPORT VOCATIONAL REHABILITATION AND COOPERATIVE EDUCATION DEMONSTRATION PROJECT

Purpose: To determine by professional research methods the most efficacious ways of providing vocational rehabilitation service for all physically, mentally, and emotionally handicapped youth, ages 14 to 21, through a cooperative arrangement between the schools of Bridgeport, local community agencies and organizations, and the Bureau of Vocational Rehabilitation.
Subjects: 300 handicapped high school students.
Methods: Using State Rehabilitation Counselors, a sequence of service procedures has been established in three high schools consisting of referral and identification, diagnosis and treatment, training and evaluation, and job placement and follow-up. Varied approaches are used and explored at each high school using control groups so that the most effective methods will be identified.
Findings: A program of skill training and treatment has been implemented for more than 400 students. The role of the rehabilitation counselor has been defined, and the counselor has received excellent reception and cooperation from the school system.
Duration: July 1965-June 1970.
Investigator(s): Paul A. Lane, Ph.D., Professor of Psychology, and Louise Soares, Ph.D., University of Bridgeport, Bridgeport, Conn. 06604.
Cooperating group(s): Bridgeport Board of Education; Vocational Rehabilitation Administration, U. S. Department of Health, Education, and Welfare.
Publication: Two publications in preparation.

21-QG-3 EVALUATION OF A WORK-STUDY PROGRAM

Purpose: To determine what effect, if any, long-term systematic work experience had on the early vocational history of young adult males from low income families.
Subjects: 69 male students from four New York City high schools; 48 took part in the Municipal Cooperative Education Program in 1962-1963, and 21 are former controls. Under provisions of the program, students worked at full time entry jobs in City departments alternate weeks and attended special curriculum classes full-time every other week for two years.
Methods: Respondents were located, group interviews held, and a planning questionnaire administered. Depth interviews were held with 16 more verbal and more aware respondents selected from among group interviewed. Tapes of individual interviews and planning questionnaires completed during the program were also obtained. Criteria used for evaluating benefits, hindrances, or ineffectiveness of the program were: ability to hold and progress in jobs, suitability and satisfaction with occupation and life-style, knowledge of job-related information and use in self-management, recognition of goals, qualifications, and interests, and plans for and attainment of further education and training.
Findings: (1) Program participants benefitted from exposure to work environment, work routine, and non-teacher adult contact, role models, and advice, especially in most office and some hospital jobs; (2) program participants benefitted from regular earnings as symbols of independence rather than for self-support; (3) cooperative students seemed to exhibit less floundering than did controls, yet few have acquired marketable skills; (4) cooperative students lacked, and felt the need for, counseling to a greater extent than did controls; (5) cooperative students suffered from isolation in the special all-cooperative classes they attended and from reduction in number of courses offered them, and limited exposure to academic and commercial courses limited aspirations and activities; and (6) program made no provision for change in work assignment if student was not satisfied, and students could not leave special classes in mid-year.

Duration: February 1966-March 1967.
Investigator(s): Eva A. Vambery (Ed.D. Candidate), Research Sociologist, Center for Urban Education, 33 W. 42nd St., New York, N. Y. 10036.
Cooperating group(s): Ford Foundation; Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Report filed with Department of Personnel of the City of New York and Center for Urban Education.

21-QG-4 AN EVALUATION STUDY OF THE EFFECTIVENESS OF THE NEIGHBORHOOD YOUTH CORPS

Purpose: To determine whether or not the Neighborhood Youth Corps program significantly improves the economic, social, and educational level of the youths who participate.
Subjects: A 25 percent random sample of Neighborhood Youth Corps participants, ages 16 to 21, matched with a control group who had sought NYC help but who are not in the program.
Methods: The Neighborhood Youth Corps provides employment and an educational program for out-of-school youth. Questionnaires and personal interviews are utilized to evaluate, study, and compare the subjects in three main areas: (1) obtaining and retaining employment, including a study of level of performance, skills acquired and money earned before and after NYC experience; (2) social improvement, including police contacts, conflicts with peers, authorities, and parents, violations of laws, and personal deportment and activities; and (3) educational adjustment or improvement, including behavior, school attendance, subjects taken and completed, and grades received. Data on each youngster in the program will be traced back two years prior to participation in the NYC, and will extend at least two years from the beginning in the program. Data will be analyzed to determine whether or not a significant relationship or difference exists between the two groups.
Duration: June 1965-1968.
Investigator(s): Murray Weisman, Associate Director, The Citizens' Committee on Youth, 909 Plum St., Cincinnati, Ohio. (Reported by NCCD. See Note, p. 73.)
Cooperating group(s): U. S. Office of Economic Opportunity.

21-QG-5 PRE-VOCATIONAL JOB TRAINING

Purpose: To provide pre-vocational job training for boys and girls who are capable of benefitting from such training and in whose home community there is a job vacancy in the particular area of training.
Subjects: Boys and girls, ages 15-1/2 and older.
Methods: Pre-vocational job training is provided in nine areas: clerical services and public contact positions; farm specialty worker; food preparation and related services; furniture repair and upholstery; home care specialist; meat cutting; nurseryman; seamstress; and automobile service. Each course consists of three hours daily vocational instruction and three hours of regular school with daily help in special education classes. A special tutoring program with greater emphasis on reading and spelling is provided for those children below the sixth grade level. Project also includes specialized job counseling at the Youth Development Center and continued counseling, job development, and placement for the youths after they leave the Center.
Duration: January 1965-September 1966.
Investigator(s): James I. Lamb, M.S.W., Youth Development Center, 325 Curry Hill Rd., Canonsburg, Pa. (Reported by NCCD. See Note, p. 73.)

Cooperating group(s): Washington County Board of Education; Pennsylvania Department of Public Welfare; Pennsylvania Department of Public Instruction; Pennsylvania Bureau of Employment Security; Office of Manpower, Automation, and Training, U. S. Department of Labor.

21-QH-1 EVALUATION OF A METHOD OF SCHOOL-TO-HOME TELEPHONE INSTRUCTION OF PHYSICALLY HANDICAPPED, HOMEBOUND ADOLESCENTS

Purpose: To determine whether use of a school-to-home telephone by physically handicapped homebound adolescents will lead to greater academic achievement and intellectual development, greater improvement in social-emotional development, and improvement in teachers' lessons.
Subjects: Physically handicapped, homebound children in Brooklyn, New York, whose student population is representative of that of all large cities.
Methods: Subjects are assigned randomly to one of two groups--experimental or control. Experimental variable consists of school-to-home telephone hook-up which permits discussion and follow-up of a radio broadcast lesson. Data collected by means of questionnaires, interviews, individual tests from students, teachers, parents, and siblings will be analyzed in terms of test scores and ratings by qualified judges.
Duration: November 1965-May 1968.
Investigator(s): Kathleen Lolis, Ph.D., Research Psychologist, Bureau of Educational Research, New York City Board of Education, 110 Livingston St., Brooklyn, N. Y. 11201.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Required reports will be submitted to the New York State Department of Education and the U. S. Office of Education. No other publication is definitely planned at this time.

21-QH-2 DEVELOPMENT OF MORE EFFECTIVE TEACHING METHODS FOR CHILDREN WITH MULTIPLE SENSORY IMPAIRMENTS

Purpose: To study methods for teaching children with multiple sensory impairments whose potentials for learning are not tapped by presently available instructional methods.
Subjects: Six sensorily handicapped children.
Methods: Standard and special educational materials are utilized. Methods are based on Piaget techniques and techniques developed at University of Minnesota. Training materials, tests, and interview procedures are carried out.
Duration: 1965-1970.
Investigator(s): Lydia Muller-Willis, Ph.D.; Peter F. Briggs, Ph.D.; Frederic J. Kottke, M.D., Ph.D., Professor and Director; and C. G. Lyle, B.A., Department of Physical Medicine and Rehabilitation, University of Minnesota Medical Center, Minneapolis, Minn. 55455.
Cooperating group(s): Michael Dowling School for Crippled Children; Minneapolis Public Schools.

21-QH-3 A PROGRAM OF INSTRUCTION IN LANGUAGE SKILLS FOR THE HANDICAPPED CHILD: AN EXPLORATORY STUDY

Purpose: To devise a technique to provide a means of communication for children whose response capability is so restricted that they cannot learn to speak or to write; to determine the effect of deficient motor control on visual perceptual abilities.
Subjects: Six-year-old athetoid cerebral palsied child unable to control movement to a large extent, and unable to speak.
Methods: Operant conditioning through use of an enlarged typewriter keyboard. Stimuli were presented either verbally or by pictures, and the response to the correct key was immediately rewarded.
Findings: Results indicated that accurate visual perception can be developed through visual scanning movements of the eyes when other motor responses are severely limited. It would appear that very early training in making scanning visual responses is of extreme importance in the intellectual development of handicapped children.
Duration: Not reported.
Investigator(s): Suzanne D. Hill, Ph.D., Assistant Professor of Psychology, Louisiana State University in New Orleans, Lakefront, New Orleans, La. 70122.
Cooperating group(s): St. Bernard Parish School Board, La.; Cerebral Palsy Research and Educational Foundation; National Science Foundation.
Publication: Submitted to *Child Development*.

SOCIAL SERVICES

21-RA-1 A PILOT STUDY OF FAMILY ADVICE SERVICES

Purpose: To gather information on a national basis of how family advice services are being planned or have already begun to be put into practice by local authority Children's Departments. The second phase of the project will consist of a more detailed and prolonged study of three or four services.
Subjects: About 18 different services in England.
Methods: The Senior Research Officer has been spending several days in each of the above services; in addition, a number of services established by voluntary organizations have also been briefly studied.
Duration: April 1966-June 1969.
Investigator(s): A. Leissner, Esq., M.S.W., Senior Research Officer, National Bureau for Co-operation in Child Care, Adam House, 1 Fitzroy Square, London, W.1., England. (Reported by M. L. Kellmer Pringle, Ph.D., Director, National Bureau for Co-operation in Child Care.)
Cooperating group(s): Children's Departments in selected local authorities; The Home Office.
Publication: Studies in Child Development, Longmans, April 1967; final report will also be published in the same series.

21-RB-1 THE FAMILY AGENT: A NEW CAREER IN HUMAN SERVICE

Purpose: To provide a new source of manpower--college-educated women available on a part-time basis--to give intensive services to multi-problem families in a low income, multi-racial urban neighborhood.
Subjects: 68 college-educated women, and 235 families referred by the Bureau of Public Assistance, the Juvenile Probation Department, or the public schools.
Methods: Under professional supervision, the Family Agents worked with from two to five families to provide or locate services in the areas of home management, budgeting, health and mental health, education, employment, and community responsibilities. Evaluation includes a study of life styles of the poor; an instrument to measure family movement; determination of the availability of this source of manpower; selection, training, and intervention techniques; and an evaluation of outcome of program.
Findings: There is a wide availability of this source of manpower, which, with adequate selection and training, can work with low income families who show widely differing life styles. Over an extended period, this type of staff can be effective in instigating family change in certain problem areas.
Duration: March 1964-October 1966. (Evaluation completed, but program continuing).
Investigator(s): Irving Lazar, Ph.D., Project Director, and Joyce B. Lazar, M.A., Training Director, Neumeyer Foundation, 405 N. Bedford Dr., Beverly Hills 90210; and Harry Grace, Ph.D., Research Director, Department of Sociology, University of Southern California, Los Angeles, Calif. 90007.
Cooperating group(s): U. S. Office of Economic Opportunity.
Publication: Results of the program, including training manual and evaluation of program, available from the Neumeyer Foundation. (Two volumes--$3.67 per volume).

21-RB-2 VOLUNTEERS TO PREVENT EMOTIONAL PROBLEMS IN CHILDREN

Purpose: To determine whether early assignment of college volunteer "big brothers and sisters" will help to prevent emotional disturbances in elementary school pupils; to establish at what age the children will benefit most from this experience; to observe the effect on participating college students.
Subjects: 20 third grade and 20 first grade "slow" children; 40 volunteer freshman college students.
Methods: College students will provide fun and curriculum enrichment for children one afternoon a week for a period of three years. Comparison will be made with children who entered school at the same time as subjects and had no service. Evaluation will include use of achievement and psychometric tests, sociometric diagrams, annual evaluation conferences, and social research procedures.
Duration: February 1966-January 1970.
Investigator(s): Ruth Thomson, M.S., Executive Director; Hans R. Huessy, M.D., Psychiatrist; John Miller, M.A., Clinical Psychologist; and Ann Kimberly, M.S., Psychiatric Social Worker, Counseling Service of Addison County, Municipal Bldg., Middlebury, Vt. 05753.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

21-RB-3 METROPOLITAN CRITICAL AREAS PROJECT

Purpose: To study new ways of organizing and developing girls' group experiences, program activities, and volunteer leadership to make a significant contribution to the social development of girls.
Subjects: Girls, ages seven through high school, including those who are mentally retarded, living in three metropolitan target areas in Boston, Mass., Detroit, Mich., and Washington, D. C.
Methods: Maximum use of program activities, innovations, and research implementation.
Duration: Not reported.
Investigator(s): Helen Rowe, Associate Director and Project Director, and Ronald Lippitt, Ph.D., Senior Research Consultant, Camp Fire Girls, Inc., 65 Worth St., New York, N. Y. 10013.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-RB-4 INITIAL REACTIONS TO THE FIRST COMMUNICATION (A LETTER) FROM A CHILD PROTECTIVE AGENCY

Purpose: To document the reactions parents or child caretakers have to a letter sent by The Massachusetts Society for the Prevention of Cruelty to Children, a child protective agency, in which the agency expresses its interest in the referred family situation and in which an appointment date is set. It has long been a question as to whether a letter or an unscheduled personal contact is the preferable method to initiate contact.
Subjects: 50 families referred to three District offices of the Massachusetts Society for the Prevention of Cruelty to Children.
Methods: A standard letter is sent to each family referred except where there is a report of abuse, crisis, or abnormality. The caseworker interviews each family following a structured interview schedule prior

to formally exploring the family situation. The research schedule elicits information on the emotional and behavioral reactions at the time the letter was received and data regarding some factors which are seen as having a relationship to the reactions.
Duration: November 1965-December 1966.
Investigator(s): Morton I. Cohen, Research Director, Massachusetts Society for the Prevention of Cruelty to Children, 43 Mt. Vernon St., Boston, Mass.
Publication: Publication planned.

21-RB-5 COMPREHENSIVE YOUTH PROGRAM OF THE EAST CENTRAL CITIZENS ORGANIZATION

Purpose: To enable teenagers, by voice and action, to bridge the fear-hate gap with adults, business, agencies, and institutions.
Methods: Youth will be the largest group of workers. They will have a large responsibility in working out and running activities such as employment aid and training, the cultural arts, social and neighborhood action, new ways of education, and recreation. Youth will learn to develop programs and use already existing agencies. They will work and participate in the youth program through a youth council and the East Central Citizens Organization Executive Council, which gives any person above 16 years of age voice, vote, and position. A program director and an assistant will work with the youth and help train two neighborhood people who have talent-interest-concern for teenagers and will help youth workers in aiding their peers.
Duration: Not reported.
Investigator(s): Leopold W. Bernhard, Project Director; Thomas Green, Program Director; and Clifford Tyree, Chairman, Executive Council, East Central Citizens Organization, 22nd and McAllister, Columbus, Ohio.
Cooperating group(s): Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-RB-6 CREATIVE ARTS FOR ALIENATED YOUTH

Purpose: To attempt to deflect trouble-prone and deviant youth from potentially self- and socially destructive activities through a program of creative arts which will enable them to develop their individual potentialities through productive expression.
Subjects: Youths indigenous to a poverty community and alienated youth, presently members of the "subculture of the uncommitted."
Methods: Program consists of a theatre program, a poetry and writing workshop, and a film-making program. Each of these three components is designed to develop serious art productions beginning with creative improvisational techniques through disciplined art expression. Artists-producers directing each program will represent role models with whom youth can readily identify. The youth population and responsiveness of the program to the youth will be assessed and evaluated.
Duration: Not reported.
Investigator(s): Rev. J. C. Michael Allen, Project Director; Harry Silverstein, Co-Director; and Bernard Rosenberg, Research Associate, Center for New York City Affairs, New School for Social Research, 70 Fifth Ave., New York, N. Y. 10011.
Cooperating group(s): Office of Juvenile Delinquency and Youth Development, Welfare Administration, U. S. Department of Health, Education, and Welfare.

BEST COPY AVAILABLE

21-RC-1 A DEMONSTRATION OF RE-ORIENTATION OF ILLEGITIMATELY PREGNANT TEENAGE GIRLS LIVING IN RURAL AREAS

Purpose: To help the illegitimately pregnant teenage girl achieve a future pattern of behavior that will meet her needs constructively; to keep the illegitimately pregnant girl in her own community where possible, and to change the community climate in terms of services to the unmarried mother.
Methods: A multi-faceted program of social, emotional, educational, and medical treatment has been established to "re-orient" girls. Period before the birth is used to reduce immediate life pressures, to provide a period of nurturing, and to plan educational, medical, and social services. After delivery, girls are helped to carry out individual plans for the future which will include the appropriate services.
Duration: Not reported-January 1969.
Investigator(s): Edith Zober, Research Director, Iowa Children's Home Society, 1101 Walnut St., Des Moines, Iowa; and Merlin Taber, Ph.D., Associate Professor, School of Social Work, University of Illinois, Urbana, Ill.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-RE-1 THE FOSTER FATHER ROLE

Purpose: To discover functional differences between natural and foster fatherhood.
Subjects: 40-45 foster families caring for a normal boy in elementary school.
Methods: Interviewing of families and caseworkers.
Duration: November 1966-December 1967.
Investigator(s): Leo Davids (Ph.D. Candidate), Department of Sociology, Hunter College, New York, N. Y.

21-RE-2 SPECIALIZED FOSTER HOME CARE FOR DEPRIVED MENTALLY RETARDED CHILDREN

Purpose: To determine the feasibility and value of foster home care for a select group of mentally retarded children; to demonstrate possible prevention and treatment of functional mental retardation through proper foster family care; and to identify those ingredients in specialized foster care that can have application for other groups of children with special needs so that this project can serve as a model for similar programs elsewhere.
Subjects: 30 children, ages 4 to 10-1/2, half of whom have a diagnosis of functional retardation due to adverse environmental experiences or parental inadequacies, and half a diagnosis of retardation due to an organic etiology; control group of 30 institutionalized mentally retarded children selected on same basis.
Methods: Children are placed in foster care and are periodically evaluated and compared with control group.
Duration: 1964-January 1967.
Investigator(s): Marjorie Wilson, Project Director, and Robert Fishman, Research Director, Kentucky Department of Child Welfare, New Capitol Annex, Frankfort, Ky.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-RK-1 THE RESPONSE OF YOUNG PARENTS AND EXPECTANT PARENTS OF LOW SOCIO-ECONOMIC STATUS TO A GROUP FAMILY LIFE EDUCATION PROGRAM

Purpose: To ascertain the reaction of participants in a family life discussion group; to determine the reasons for attrition of the group, and the reasons why eligible non-participants are not interested in joining the group.
Subjects: Couples in which the wife is 20 years of age or younger at the start of the program and a patient at one of two maternity clinics.
Methods: Structured interviews, guided by schedules which contain both pre-coded and open-ended questions.
Duration: June 1966-tentatively 1971.
Investigator(s): Elizabeth L. Lyman, Ph.D., Research Associate, and Janet S. Brown, M.S.W., Staff Associate, Community Service Society, 105 East 22nd St., New York, N. Y. 10010.
Cooperating group(s): Lincoln Hospital, St. Francis Hospital, Mill Brook Community Center of East Side House Settlement, Bronx, New York.
Publication: Probably a mimeographed report will be available for a modest fee.

21-RL-1 PROLONGED STAY OF CHILDREN IN TEMPORARY CARE SHELTERS

Purpose: To identify and describe factors which contributed to lengthy stays in the temporary care shelters of the New York City Department of Welfare.
Subjects: 370 children who entered the temporary care shelters during first six months of 1964 and remained for more than one month.
Methods: Information regarding children's characteristics was transcribed from case records kept at the temporary care shelters; information regarding allocation process was transcribed from cards kept by Allocation Section of Bureau of Child Welfare, New York City Department of Welfare.
Findings: The report contains four sections: (1) the time involved in accomplishing each step of the placement procedure; (2) religion and race-ethnicity of the children whose cases were involved in the placement process; (3) a comparison of children who were rejected for placement by one or more agencies with those who were accepted upon initial consideration by an agency; and (4) characteristics of children who ultimately entered long-term foster care as compared with those of children who returned to their own (or similar) homes after both had spent more than one month in the shelters.
Duration: March-September 1966.
Investigator(s): Lawrence Podell, Ph.D., Assistant to the Commissioner for Research, and Ted Nelson, Ph.D., Principal Research Scientist, Office of Social Research, New York City Department of Welfare, 271 Church St., New York, N. Y. 10013.
Cooperating group(s): Bureau of Child Welfare, New York City Department of Welfare.
Publication: Information will be available from the Office of Social Research, New York City Department of Welfare, 271 Church St., New York, N. Y. 10013.

21-RL-2 NATIONAL STUDY OF CHILDREN IN CARE

Purpose: To study, on a national scale, the effects of young children having been in care, and to relate these to the mother's personal and social history, as well as to the child's birth history.
Subjects: All those children from the National Child Development Study (1958 cohort) who have been in care for shorter or longer periods during the first seven years of their lives.
Methods: A detailed and comprehensive inquiry will be made into the reasons for coming into care, type of substitute care given, whether and why changes in arrangements had to be made, as well as duration and frequency of separation from their own families; also, comparisons will be made between the emotional, social, educational, and physical development of those who have been in care and those who continued to live at home.
Duration: October 1966-April 1968.
Investigator(s): E. Pugh, B.A., Senior Research Officer, National Bureau for Co-operation in Child Care, Adam House, 1 Fitzroy Square, London, W.1, England. (Reported by M. L. Kellmer Pringle, Ph.D., Director, National Bureau for Co-operation in Child Care.)
Cooperating group(s): Children's Departments in England, Scotland, and Wales; Nuffield Foundation.
Publication: Probably in Studies in Child Development, National Bureau for Co-operation in Child Care.

HEALTH SERVICES

21-SA-1 STUDY OF RELATIONSHIP BETWEEN HEALTH INFORMATION, ATTITUDES, AND ACTION

Purpose: To study (1) relationships between information about and attitudes towards disease among teenagers and preventive health action taken; (2) ways in which changes in attitudes precipitate corresponding action; and (3) other factors affecting both attitudes and the probability of taking action.
Subjects: Approximately 250 boys and girls, ages 14 to 17, at various summer camps in Virginia and Maryland.
Methods: In a field experiment, attitudes towards diabetes among adolescents and time delay in the opportunity for health action as well as certain other variables are systematically varied under controlled conditions. The criterion is volunteering for a screening test for diabetes.
Duration: April-December 1966.
Investigator(s): Godfrey M. Hochbaum, Ph.D., Chief, and Bonnie Zwicker, Research Psychologist, Behavioral Science Section, Research Grants Branch, Division of Community Health Services; and Fred Heinzelmann, Ph.D., Research Psychologist, Heart Disease Branch, Division of Chronic Diseases, Public Health Service, U. S. Department of Health, Education, and Welfare, Washington, D. C. 20201.
Publication: Journal article planned in 1967.

21-SA-2 ALLERGIES IN CHILDREN AND ADOLESCENTS: CONTINUED STUDY

Purpose: To follow up 928 12th grade students who were randomly selected from three socio-economic levels and surveyed for allergies as 8th graders (1963) in the Denver public schools; to study the progress of these allergies from early to mid-adolescence as well as their effect on school attendance and disability; to investigate adequacy of medical care obtained for these conditions and its variation among the different socio-economic levels.
Methods: Questionnaire will be administered. An intensive medical and laboratory study of a smaller 150 random sample from another 12th grade class will be used for comparison. In addition, 1,000 pre-school children in Head Start programs will be seen for allergy history and nasal cytology studies to investigate the finding from the original survey that much less allergy was reported from the lower socio-economic group. These children had seen fewer medical specialists for these conditions and had less continuing care than middle and upper class children. It is hypothesized that this difference in reporting is due to inferior diagnostic services and care available to this group as well as failure of this group to seek care as readily for these chronic conditions.
Duration: Not reported.
Investigator(s): Samuel Johnson, M.D., Director, Division of Public Health and Preventive Medicine, and Geraldine Freeman, M.D., Pediatric Allergist, Denver Department of Health and Hospitals, West 6th Ave. and Cherokee St., Denver, Colo. 80204.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-SA-3 DETERMINATION OF THE PREVALENCE AND SPECIAL NEEDS OF CHILDREN WITH BRONCHIAL ASTHMA OR ATOPIC DERMATITIS

Purpose: To determine (1) the prevalence and care needs of children with atopic disorders in the State of Maryland by determining the prevalence and characteristics of children with bronchial asthma in a sample population of elementary school age children, and (2) the prevalence of children with atopic dermatitis in a sample population of one-year-old children.
Subjects: A stratified random sample of children drawn from either pupil rosters or birth certificates.
Methods: Mothers of children were interviewed in their home and data obtained concerning the medical history, physical and social environment, and family structure of each child. Physical examinations and skin tests were conducted on all cases and two controls matched for age, sex, race, and residential history. Medical reports were obtained from clinics or personal physicians reported by the mother to be the child's regular source of medical care.
Duration: Not reported.
Investigator(s): Marie Britt Rhyne, M.D., Assistant Professor of Pediatrics; David Mellits, Sc.D., Assistant Professor of Biostatistics and Assistant in Pediatrics; and Anne Clark Rodman, M.S., Assistant in Biostatistics, Johns Hopkins University School of Medicine, Baltimore, Md. 21205.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.
Publication: Monograph will focus upon programming for delivery of comprehensive health care to atopic allergic children.

21-SB-1 A HEARING CONSERVATION PROGRAM FOR CHILDREN

Purpose: To develop and maintain a statewide hearing conservation program for school students of Kansas; to evaluate the effectiveness of a hearing conservation program using a mobile testing unit.
Subjects: 200,000 students.
Methods: A mobile testing unit with identification audiometry is used to locate children with hearing loss who need medical or educational assistance in treatment and rehabilitation. Major emphasis is placed on prevention, casefinding, and diagnosis. The private physician in the community receives initial referrals. Project attempts to cultivate community interest in hearing problems and their conservation, and to motivate the development of similar programs in the schools of the State.
Duration: Not reported.
Investigator(s): Patricia T. Schloesser, M.D., and Evalyn S. Gendel, M.D., Kansas State Department of Health, State Office Building, Topeka, Kan.
Cooperating group(s): Public Health Service, U. S. Department of Health, Education, and Welfare.

21-SB-2 EVALUATION OF A COMMUNITY-WIDE PROGRAM IN FIRST GRADE

Purpose: To evaluate effectiveness of a community-wide school program of prevention and early treatment for first grade children of a lower socioeconomic urban Negro neighborhood in reducing prevalence of maladaptation and/or mental illness during first school years and later in school careers as measured at end of third grade.
Subjects: 2,017 first graders in 57 classrooms in Woodlawn.

Methods: Weekly classroom group meetings and school staff meetings are held in experimental schools. Outcome for children in both experimental and control schools is assessed at end of first and third grades, in terms of classroom adaptation, psychiatric status, and school performance. Institutional outcome is being assessed for both experimental and control schools in terms of differences in teachers' views of classroom maladaptation with subsequent cohorts of first graders, and teachers' comfort in the school. In addition, children in program schools who improve will be compared with those who do not, in terms of initial classroom maladaptation ratings, psychiatric status, ability test scores, and characteristics of the children and their families, obtained by family interviews.
Duration: January 1967-December 1970.
Investigator(s): Sheldon K. Schiff, M.D., and Sheppard G. Kellam, M.D., Assistant Professors of Psychiatry, University of Illinois College of Medicine, and Co-Directors, Woodlawn Mental Health Center, 841 E. 63rd St., Chicago, Ill. 60637.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

21-SC-1 INCREMENTAL ORAL HEALTH SERVICES PROVIDED BY DENTAL STUDENTS

Purpose: To determine practicality of using fourth year dental students during summer vacation as a source of dental manpower; to determine any attitude shifts concerning dentistry in children treated by dental students in the community; and to determine the attitude of health and community leaders about the program.
Subjects: Elementary school children.
Methods: Operating in five mobile clinics, each equipped with two dental chairs, fourth year students will provide complete dental care for elementary school children in Wolfe County, Kentucky. Children in lower grades will be treated first. Program will include education in prevention of dental disease for teachers, children, and parents. Clinical operation will be supervised by faculty members from the University of Kentucky College of Dentistry. Per unit and per patient cost of the project will be determined at the end of each operating year. A written attitude scale will be used to assess the attitude of fourth, fifth, and sixth grade students concerning dentistry at the beginning of the project, and again after three and five years of operation. Personal interviews will be used to assess the attitude of community leaders and health personnel about the project at end of fifth year.
Duration: November 1966-October 1971.
Investigator(s): Wesley O. Young, D.M.D., M.P.H., Professor and Chairman; Arlen G. Podshadley, D.D.S., M.S.D., Assistant Professor; and Edith R. Sanders, R.D.H., M.P.H., Instructor, Department of Community Dentistry, College of Dentistry, University of Kentucky, Lexington, Ky. 40506.
Cooperating group(s): Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Comprehensive booklet to be published by Department of Community Dentistry.

21-SC-2 THE DENTAL STATUS OF MENTALLY RETARDED CHILDREN

Purpose: To identify the blocks inherent within the dental profession which interfere with rendering care to mentally retarded children; to determine what dental problems exist in the mentally retarded children

of Georgia, whether their dental problems differ from those of normal children, and if so, how; to identify the blocks which mentally retarded children or their parents experience in obtaining dental care for these children.
Subjects: A 10 percent sample of the practicing dentists in Georgia; a 50 percent random sample of severely retarded and trainable children in the state institution for retarded children, a 16 percent sample of the 7,000 educable mentally retarded children enrolled in the "special" classes in the public school system in Georgia, selected at random by classroom, and a randomly selected sample from among the 70 day care schools sponsored by units of the Georgia Association for Retarded Children, including a "total" population of 648 trainable children; parents of all examined non-institutionalized retarded children.
Methods: Questionnaires were employed in the attitudinal or behavioral aspects of the study. They were distributed through teachers of those classrooms selected for study and were gathered by the teachers and coordinators of special education for the particular school systems. Telephone and personal interviews were conducted with dentists. In gathering dental disease data (DMF, OHI, RPI rates), examinations which had been previously standardized and calibrated were conducted by dentists in public health.
Findings: Dentists felt a need for special training and facilities if they were to provide care for retarded children. Many dentists did not know where to refer such children for adequate dental care. Mentally retarded children experienced less dental caries attack than did their "normal" counterparts, but they have more severe gingival disease and less evidence of reparative dental care. Their high prevalence of periodontal deviations appears to parallel a strikingly apparent inadequacy in oral hygiene. Most parents recognized the importance of dental care. Parents of more severely retarded children utilize dentists more for their children than do parents of children who are not as retarded. The private dentist is the chief resource used by parents for the provision of dental care to their retarded children. For those retarded children who did not have dental care in the 18 months immediately prior to the survey, the chief apparent reason was that the parent did not believe the child needed care. The next reason was cost.
Duration: August 1965-June 1966.
Investigator(s): John E. Butts, D.M.D., M.P.H., Resident in Dental Public Health, Georgia Department of Public Health, 47 Trinity Ave. S.W., Atlanta, Ga. 30303. (Reported by Sidney L. Miller, D.D.S., M.P.H., Director of Special Dental Programs, Georgia Department of Public Health.)
Cooperating group(s): Georgia Association for Retarded Children; Georgia Department of Education; Public Health Service, U. S. Department of Health, Education, and Welfare.
Publication: Submitted in sections to Journal of Public Health Dentistry.

21-SD-1 THE HEALTH VISITOR AS AN ADJUNCT WITH URBAN MATERNAL AND CHILD CARE SERVICES

Purpose: To recruit a new category of paramedical personnel, the health visitor, from members of disadvantaged groups; to improve utilization by socially disadvantaged groups of maternal and child care programs.
Methods: Health visitors will receive a six-month period of training in health and will then function in four separate settings: a housing project, a public school, a local union shop, and a small neighborhood, encouraging participation in official programs of aid. There will be a

simultaneous evaluation of training procedure, integration into the different communities, activities of health workers, their ability to relate to local community leaders, their job satisfactions, the response of official agencies, impact on local residents, and changes in utilization rates, and vital statistics when appropriate.
Duration: Not reported.
Investigator(s): Daniel Rosenblatt, Ph.D., Assistant Professor, Department of Environmental Medicine and Community Health, and Melvin Cohen, Instructor and Research Associate in Social Psychology, Department of Psychiatry, Downstate Medical Center, State University of New York, 450 Clarkson Ave., Brooklyn, N. Y. 11203.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-SD-2 PROGRAMMING FOR SOCIAL RESEARCH IN MATERNAL AND CHILD HEALTH

Purpose: To learn more about methods for effective short-term intervention in family crises associated with the developmental process or hazardous situational factors.
Subjects: Chronically ill and handicapped children experiencing an emergency flare-up or a breakdown in management of the disability which requires hospitalization; families of children with birth defects, prematures, pregnant mothers experiencing psychosocial stress, and families experiencing special problems around school entry.
Methods: The investigation will focus on the process of crisis, methods of intervention, and evaluation of the effectiveness of intervention.
Duration: Not reported.
Investigator(s): M. Harry Jennison, M.D., Medical Director, The Stanford Children's Convalescent Hospital; Martin I. Heinstein, Ph.D., Project Director, and Dorothy Ann Waring, M.S.W., Senior Research Assistant, Division of Clinical Social Work, Stanford University School of Medicine, 300 Pasteur Dr., Palo Alto, Calif.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-SD-3 NATIONAL STUDY OF MATERNITY CARE

Purpose: To study the present status of obstetrical practice in the United States; to review maternal and child health services in health departments, including the quality of maternity and newborn care in hospitals and the quantity and quality of prenatal care, with special emphasis on patient motivation factors; to develop the obstetric education and professional personnel training phase of the overall study; to evaluate all facets of maternity care in order to formulate future policies and programs.
Investigator(s): Donald B. Berg, American College of Obstetricians and Gynecologists, 79 West Monroe St., Chicago, Ill. 60603.
Cooperating group(s): American Public Health Association; American Medical Association; American Academy of Pediatrics; American Academy of General Practitioners; American Hospital Association; National Institute of Neurological Diseases and Blindness, and National Institute of Child Health and Human Development, Public Health Service, and Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-SD-4 DISCONTINUITY OF CARE IN A CRIPPLED CHILDREN'S PROGRAM

Purpose: To determine the non-medical factors influencing receipt of services by children in a state welfare-medical program for the handicapped.
Subjects: A panel of children and their mothers applying to the Division of Services for Handicapped Children, Michigan Department of Public Health.
Methods: The inquiry is directed first to child's mother, and secondly to agency administering the program. The study is primarily sociological, sociopsychological, and economic. Dependent variables include degree of utilization of clinic services and whether parents re-apply after a year of services; independent variables include severity of handicap, expectation of benefits from treatment, socio-economic status, mother's alienation from society and from her family, and mother's attitude toward work, welfare, and dependence, as well as her reaction to the agency's interview concerning her economic eligibility.
Duration: Not reported.
Investigator(s): Donald C. Smith, M.D., Professor; Harold Decker, M.D., Assistant Professor; Richard A. Bogg, and Edward A. Duffy, Research Associates, Maternal and Child Health, Department of Health Development, University of Michigan, Ann Arbor, Mich. 48104.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-SD-5 A SOCIOLOGIC STUDY OF INDIGENT PRIMIGRAVID PREGNANCY

Purpose: To test the hypotheses that: (1) different patterns of behavioral and attitudinal adaptation to pregnancy exist among indigent primigravid patients, and that these differences exist not only between Negro and white patients, but within these two racial groups as well; (2) these different patterns of behavioral and attitudinal adaptation are associated with cultural and structural characteristics of the social environment; (3) the association between characteristics of the social environment and adaptation to pregnancy is mediated through intervening social psychological variables such as alienation, achievement motives, authoritarianism, and anxiety; and (4) these different patterns of behavioral and attitudinal adaptation are related to pregnancy outcome, i.e., rates of prematurity, perinatal mortality, and other forms of reproductive wastage.
Subjects: 1,000 indigent primigravid patients at Grady Hospital, Atlanta, Georgia.
Methods: Will collect data relating to: (1) cultural and structural characteristics of the social environment (age, race, education, economic factors, etc.); (2) intervening social psychological variables (alienation, normlessness, etc.); (3) behavior and attitudes in pregnancy; and (4) pregnancy outcome. Standard statistical techniques will be used in studying the relationships between variables and drawing inferences to the study population.
Duration: Not reported.
Investigator(s): William L. Graves, Department of Obstetrics and Gynecology, School of Medicine, Emory University, 80 Butler St., S.E., Atlanta, Ga. 30303.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-SE-1 THE EFFECT OF PREGNANCY SPACING ON BIRTH OUTCOME

Purpose: To explore the effect of pregnancy spacing on birth outcome.
Methods: Computer matching of consecutive birth events to the same woman from vital statistics in three states. Multivariate analysis will allow measurement and simultaneous control of the interrelationships to both pregnancy spacing and birth outcome of race, age, parity, and socio-economic status.
Duration: Not reported.
Investigator(s): J. Richard Udry, Ph.D., Associate Professor of Sociology, and Associate Professor; Naomi M. Morris, M.D., M.P.H., Assistant Professor; and Sidney S. Chipman, M.D., M.P.H., Professor, Department of Maternal and Child Health, School of Public Health, University of North Carolina, Chapel Hill, N. C.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-SE-2 OPERATIONAL EVALUATION OF FAMILY PLANNING SERVICES

Purpose: To develop research strategies for evaluating family planning services; eventually, to survey other clinic service activities and staffing patterns; to conduct study of various means of patient follow-up and casefinding; and to construct new demographic measures of program impact.
Methods: Planned Parenthood centers, voluntary and tax-supported hospitals, and health departments will be included.
Duration: August 1966-July 1967.
Investigator(s): Steven Polgar, Ph.D., Director of Research, Planned Parenthood Federation of America, 515 Madison Ave., New York, N. Y. 10022.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-SF-1 EVALUATION OF THE INTERDISCIPLINARY TEAM FOR PROFESSIONAL TRAINING AND FOR PROVISION OF SERVICES TO HANDICAPPED CHILDREN

Purpose: To investigate effectiveness of the interdisciplinary team approach in providing patient services and professional training in clinics serving handicapped children.
Methods: There will be accumulation and comparison of empirical data relevant to diagnostic formulations, and programmatic recommendations and prognostic judgments made by individual professionals functioning alone and by interdisciplinary teams of varying size and disciplinary composition. Data relative to the influence of professional training of varying lengths of time within an interdisciplinary-oriented clinic setting will also be collected and analyzed.
Duration: Not reported.
Investigator(s): Robert W. Deisher, M.D., Director, Clinic for Child Study, School of Medicine, University of Washington, Seattle, Wash.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-SF-2 CARE-BY-PARENT UNIT FOR HOSPITALIZATION OF CHILDREN

Purpose: To determine the most effective and efficient manner of operating a Care-by-Parent Pediatric Unit for the hospitalization of non-acutely ill children in Kentucky.
Subjects: 12 patients and one parent each.
Methods: Child is cared for by parent under medical supervision from Pediatric Outpatient staff. All diagnostic and special treatment facilities of the Medical Center are available with minimal number of hospital attendants. Staff will utilize best methods of teaching parents to handle specific medical and child care problems, especially in chronically ill patients. Costs and charges will be defined, and necessary approaches will be found to adapt the unit to needs and peculiarities of Kentucky people, especially those from Appalachia. Effect of parent care will be under constant evaluation, as will the impact of the unit on the staffing of the conventional pediatric ward.
Duration: Not reported-March 1967.
Investigator(s): Warren E. Wheeler, M.D., Professor and Chairman, and Vernon L. James, M.D., Assistant Professor, Department of Pediatrics, Medical Center, University of Kentucky, Lexington, Ky. 40506.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-SF-3 FOLLOW-UP CARE AND A PEDIATRIC EMERGENCY ROOM

Purpose: To identify significant variables in the use of pediatric emergency room services, particularly the use of follow-up care, when indicated, in respect to household characteristics, pattern of usage of health facilities, and attitude toward existing facilities.
Subjects: Population selected from pediatric emergency room patients with recent diagnosis of acute infectious disease.
Methods: Children are divided into those attending and those not attending prescribed follow-up care. Field visits are made to homes of both groups to examine health status of index child and characteristics of household members, to identify sources of medical and social services used, and to define attitudes toward and reasons for use of particular health facilities.
Duration: June-August 1966.
Investigator(s): Jonas N. Muller, M.D., Professor and Head, and Ruth M. Heifetz, M.D., Instructor, Department of Preventive Medicine, New York Medical College, Fifth Ave. at 106th St., New York, N. Y. 10029.
Cooperating group(s): Health Research Training Program, New York City Department of Health.

21-SF-4 EFFECTIVE PATIENT CARE IN THE PEDIATRIC AMBULATORY SETTING

Purpose: To develop methods of improving medical "effectiveness" in pediatric care within a comprehensive outpatient department, with the main effort directed toward the "ordinary" patient and his family.
Subjects: A multi-disciplinary research team including pediatricians, public health nurses, a social worker, and consultants from the social sciences, and the University nursing school and computer center.
Methods: Will develop a co-professional doctor-nurse relationship that will attempt to assess problems of management simultaneously with the medical investigation. By anticipating problems that could interfere with care and by incorporating this information into initial planning and

subsequent follow-up, it is expected that a detectable improvement in medical "effectiveness" will be demonstrated. New methods will also be studied for evaluation of medical effectiveness, distribution of professional responsibility, and organization of ambulatory services. The first year of the three-year program will include development of study methods and experience in the proposed approach followed by a pilot study; the second and third years will be a full-scale study, applying the devised methods to a broad area of general pediatric care.
Duration: Not reported.
Investigator(s): Donald Fink, M.D., Assistant Professor of Pediatrics and Program Director, Department of Pediatrics, San Francisco Medical Center, University of California, San Francisco, Calif. 94122.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-SF-5 PATIENT-CARE PROGRAMS: DEMONSTRATION TEACHING PROJECTS IN FAMILY MEDICAL AND ADOLESCENT MEDICAL CARE

Purpose: To develop training programs for medical students and house officers and later, allied medical professionals, in delivery of health services to patients; to conduct research in the delivery of health services.
Methods: Combination of teaching the hard facts of health and illness with the skills of effective delivery of optimum health services to the patient. Primary areas of interest are on child health and maternal health, with consideration of the family and social aspects of health and illness.
Duration: Not reported.
Investigator(s): Robert J. Haggerty, M.D., Professor and Chairman, Department of Pediatrics, School of Medicine and Dentistry, University of Rochester, 260 Crittenden Blvd., Rochester, N. Y. 14620.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-SF-6 PLAN TO PROMOTE AND STUDY THE EFFECTIVE UTILIZATION OF NON-PROFESSIONAL PERSONNEL IN CHILDREN'S BUREAU RETARDATION CENTERS

Purpose: To develop a plan to study the effective utilization of non-professional personnel in mental retardation centers.
Methods: Technicians at 10 Children's Bureau mental retardation centers will be trained to operate a decision-free psychometric data collection, analysis, and report-writing tool. Data will be collected by a diagnostic "decision-tree." Manually or electronically operated algorithms will yield various stages of raw and derived data displays, including an automatically generated report. The algorithms will process the raw data through a set of problem-solving matrices to yield numbered "patterns" corresponding to such sources of deviations from "normally expected psychometric score patterns" as general mental subnormality, low scores due to such mental handicaps as language or memory disorders, poor quality raw data due to inadequate patient challenge, clerical errors, etc.
Duration: Not reported.
Investigator(s): Henry J. Mark, Sc.D., Associate Professor of Pediatrics, Otolargyngology, and Environmental Medicine; Shirley Mark, M.A., and James T. Herriot, M.A., Instructors in Pediatrics, Johns Hopkins University School of Medicine, Baltimore, Md. 21205.
Cooperating group(s): Children's Bureau, Welfare Administration, U. S. Department of Health, Education, and Welfare.

21-SG-1 **FOLLOW-UP STUDY OF CHILDREN WHO PARTICIPATED IN A PREVENTIVE MENTAL HEALTH PROGRAM**

Purpose: To provide follow-up information concerning achievement, behavioral, and adjustive status of a group of school children who participated for their first three school years in an experimental program designed to prevent emotional disorders. Specifically, to determine (1) whether the already demonstrated positive effects of the program at the third grade level have endured over time, and (2) the course of development of the emotionally disturbed child for whom no specific treatment has been provided over time.
Subjects: Seventh grade students.
Methods: Children from the experimental school will be compared at seventh grade level with control school youngsters on a variety of school record measures (i.e., nurses' referrals, attendance, grades, achievement test scores, etc.) as well as on a test battery including personality and adjustment indices, teachers' ratings, sociometric peer ratings, etc. Finally, within the experimental school, the emotionally disturbed group will be compared with its non-disturbed peer group on the same school record and test measures.
Duration: Not reported-Summer 1967.
Investigator(s): Emory L. Cowen, Ph.D., Professor of Psychology and Director of Clinical Training, and Melvin Zax, Ph.D., Associate Professor of Psychology, University of Rochester, River Campus Station, Rochester, N. Y. 14627.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publication: Paper presented at Eastern Psychological Association meeting, April 1967.

RESEARCH NOTES

CENTER FOR RESEARCH AND ADVANCED TRAINING IN DEAFNESS REHABILITATION

The Center for Research and Advanced Training in Deafness Rehabilitation was initiated at New York University under the sponsorship of the Vocational Rehabilitation Administration. The Center's program is organized around three main branches: Training, Research, and Consultation. In research, the major concern is with the field of human communication, programmatically designed for integrated studies of the multiple aspects of communication. (Hearing & Speech News, March 1967.)

NATIONAL LABORATORY IN EARLY CHILDHOOD EDUCATION

The Office of Education, U. S. Department of Health, Education, and Welfare, has established a National Laboratory in Early Childhood Education, under which centers have been set up at seven colleges and universities. These centers will represent a diversity of philosophies and approaches to early childhood education. Research and development activities of the Laboratory will be coordinated by the Center at the University of Illinois (which is also one of the eighteen ERIC Clearinghouses referred to on the following page). Information on the National Laboratory may be obtained from Dr. J. McVicker Hunt, Director, National Coordination Center, 805 West Pennsylvania Ave., Urbana, Ill. 61801.

Dissertation Abstracts, University Microfilms, Ann Arbor, Mich. 48103. (Gives synopses of U. S. doctoral dissertations with an annual index.)
dsh Abstracts, Deafness, Speech and Hearing Publications, Gallaudet College, Washington, D. C. 20002.
Excerpta Criminologica, New York Academy of Medicine Bldg., 2 E. 103rd St., New York, N. Y. 10029.
Inventory of Social and Economic Research in Health, Health Information Foundation, 5555 So. Ellis Ave., Chicago, Ill. 60637.
Listing of Health and Welfare Research Projects in Local Communities, United Community Funds and Councils of America, Inc., 345 E. 46th St., New York, N. Y. 10017.
Nursing Research, American Journal of Nursing Co., 10 Columbus Circle, New York, N. Y. 10019.
Nutrition Abstracts and Reviews, Rowett Research Institute, Bucksburn, Aberdeenshire, Scotland.
Psychological Abstracts, American Psychological Association, 1333 - 16th St., N. W. Washington, D. C. 20036.
Rehabilitation Literature, National Society for Crippled Children and Adults, 2023 W. Ogden Ave., Chicago, Ill. 60612.
Research and Study Projects Reported by FSAA Member Agencies, Family Service Association of America, 215 Park Ave. South, New York, N. Y. 10003.
Sociological Abstracts, Leo P. Chall, 225 W. 86th St., New York, N. Y. 10024.

Through the Educational Resources Information Center (formerly the Educational Research Information Center), better known as ERIC, current research and research-related information will be made available to teachers, administrators, researchers, commercial organizations, and others. ERIC also includes eighteen clearinghouses, or documentation centers, located at universities and other institutions throughout the country. Each clearinghouse will concentrate on a different subject-matter area. More complete information may be obtained by writing to the Director of ERIC, Office of Education, U. S. Department of Health, Education, and Welfare, Washington, D. C. 20202.

The Excerpta Medica Foundation, New York Academy of Medicine Building, 2 E. 103rd St., New York, N. Y. 10029, has established an abstracting service on pediatrics on a yearly subscription basis. In addition to abstracts, the Foundation can provide to subscribers, at cost, photocopies and translations of complete articles.

The Human Relations Area Files have classified cultural data on primitive and non-primitive societies into 710 categories of human behavior. Complete sets of all files are available in 22 member institutions in the United States. For information, write to Dr. Clellan S. Ford, President, Human Relations Area Files, Yale University, New Haven, Conn. 06520.

The Minnesota Family Study Center can supply to interested scholars bibliographic information from the Inventory of Published Research in Marriage and Family Behavior. Requests for information should be addressed to the Director, Inventory of Published Research in Marriage and Family Behavior, Social Science Tower 1026, University of Minnesota, Minneapolis, Minn. 55455. (Journal of Marriage and the Family, May 1966, p. 142.)

The Library of the National Society for Crippled Children and Adults has initiated a photoduplication service for persons engaged in rehabilitation research. It is available without charge to personnel in educational or research institutions and health or welfare agencies, public or private. This service hopes to provide the necessary professional literature not available in local libraries. Further information may be obtained by writing to the Librarian of the Society, 2023 W. Ogden Ave., Chicago, Ill. 60612. (Rehabilitation Literature, April 1966, p. 109.)

The Science Information Exchange, Smithsonian Institution, 209 Madison National Bank Bldg., 1730 M St., N. W., Washington, D. C. 20036, provides to qualified investigators on request selected abstracts of current research supported by foundation or government grants. The Exchange covers such fields as medicine, nursing, public health, nutrition, psychology, education, anthropology, mental health, and intercultural relations.

The World Federation for Mental Health, 19 Manchester St., London W.1, England, operates a clearinghouse for research and study projects in the field of mental health.

The Library of the National Bureau for Child Welfare (Voor Kinderbescherming), Stadhouderslaan 150, The Hague, publishes abstracts of articles in the field of child welfare each month. These are in Dutch, but those familiar with the Universal Decimal System would be able to understand something about the article. The subscription rate for documentation on cards is 30 guilders (approximately $8.40).

In addition to these journals and services, many professional journals in such fields as pediatrics and mental deficiency include a section of abstracts regularly or once a year. There are also a number of indexes and abstracting journals in the medical area which occasionally refer to materials in the area of child development.

THE CHILDREN'S BUREAU
AND ITS
CLEARINGHOUSE FOR RESEARCH IN CHILD LIFE . . . .

The Children's Bureau was established in 1912 to "investigate and report. . . . upon all matters pertaining to the welfare of children and child life among all classes of our people." From this beginning, the Bureau has extended its activities into such areas as developing standards of care for children and providing funds to States to improve conditions for children. More recently, the Bureau has established several new grants programs to support research in areas of maternal and child health and child welfare.

In keeping with the basic Act establishing the Bureau, the Clearinghouse for Research in Child Life was set up in 1948. Its function is to collect information about current research relating to children in order to make such information available for the use of investigators, administrators, program planners, and practitioners.

Investigators reporting a study to the Clearinghouse receive a free copy of the issue of *Research Relating to Children* in which their study appears. A free copy of each issue is also sent to directors of research centers and to libraries. In addition, the Clearinghouse maintains a mailing list of interested persons who receive announcements of new issues as they are published. Individuals may purchase copies from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

The Children's Bureau Clearinghouse routinely exchanges information with the Science Information Exchange of the Smithsonian Institution. This organization is very helpful in providing abstracts of research supported by federal funds and by many foundations.

The major source of information, however, is the individual research investigator, whose help is essential in obtaining the most complete and up-to-date coverage possible.

U.S. DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE
SOCIAL AND REHABILITATION SERVICE

Children's Bureau
Washington, D.C. 20201

INSTRUCTIONS

Please report studies in progress (or recently completed) which:

center on children or their families in such areas as child growth and development, intelligence, personality, education, social adjustment, family life, physical and emotional disorders, etc.

concern service programs in the fields of child health, child welfare, or special education

Please *DO NOT* report:

studies already reported to the Clearinghouse

purely medical studies limited to morphology or physiology, the physical aspects of etiology, epidemiology or symptomatology of diseases or handicapping conditions, surgery, chemotherapy, antibiotics or physical therapy; biochemical or other laboratory studies; animal studies

educational studies of curriculum construction or materials, teaching methods, surveys of school facilities or needs, general school administration studies

studies already published in sources generally available in major libraries across the country

demonstration projects, unless there is a formal plan for evaluation

studies of test development, standardization, or validation, except for special groups of children such as blind or retarded

regularly collected material such as annual reports, work preparatory to writing handbooks; directories; research based on secondary sources

master's theses, unless they represent work beyond a doctorate, as in dentistry

CHILDREN'S BUREAU
CLEARINGHOUSE FOR RESEARCH IN CHILD LIFE
WASHINGTON, D C. 20201

If you or your colleagues are currently engaged in research on children or their families, we would greatly appreciate your cooperation in providing a short summary of your work for inclusion in the next issue of *Research Relating to Children.*

The Clearinghouse is the branch of the Children's Bureau which collects and disseminates information on current research relating to children and their families. Its purpose is to provide research investigators with information about other research in progress, to point up gaps in present research, and thereby to stimulate more effective research.

The instructions on the preceding page of this form will serve as a guide for your summary. You will, of course, receive a free copy of the issue in which your study appears.

If you know of others doing research which might be of interest to the Clearinghouse, please give name(s) and address(es) below:

____

____

Thank you for your cooperation.

CLEARINGHOUSE PUBLICATIONS

Bibliography on the Battered Child, May 1966. Copies free from the Clearinghouse, Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare, Washington, D. C. 20201.

Research Relating to Juvenile Delinquents, 1966. A listing of studies reported to the Clearinghouse between 1948-1961, including publication references. Single copies free from the Clearinghouse; also available directly from the Government Printing Office, Washington, D. C. 20402, for 35 cents.

Research Relating to Mentally Retarded Children, 1966. A listing of studies reported to the Clearinghouse between 1948-1965, including publication references. Single copies free from the Clearinghouse; also available directly from the Government Printing Office for 65 cents.

Research Relating to Children.* An inventory of abstracts of ongoing or recently completed research studies published once or twice a year. Single copies of the following issue are available without charge from the Clearinghouse. (Dates indicate period during which studies were reported to us.)

Bulletin II, Supplement 4 (February-November 1955)

The following issues are available for purchase directly from the Government Printing Office, at the prices indicated:

Bulletin 17 (February 1963-February 1964) - 75 cents
Bulletin 18 (March-December 1964) - $1.25
Bulletin 19 (January-September 1965) - $1.50
Bulletin 20 (October 1965-May 1966) - $1.25

All issues not listed above are OUT OF PRINT but are available in many libraries.

---

*An investigator receives a free copy of the issue of Research Relating to Children in which his study appears. A free copy of each issue is available to libraries and research centers. The Clearinghouse also maintains a mailing list of interested persons who receive announcements of new issues as they are published.

CLEARINGHOUSE FOR RESEARCH IN CHILD LIFE

For sale by the Superintendent of Documents, U.S. Government Printing Office
Washington, D.C. 20402 – Price $1.00

FOREWORD

This Bulletin, like previous issues, includes reports of research in progress or recently completed. With the exception of the long-term research, it does not report again studies included in Bulletins 3 through 21 even though they may still be continuing. This issue, therefore, does not reflect all research relating to children in a given period but only that which was first reported to the Clearinghouse May through December 1967.

The Clearinghouse has only such information about the studies as the abstracts provide. Publication references and plans are given by some of the investigators but the Clearinghouse does not maintain bibliographic information on published reports of the studies. The reader who wishes to obtain further details about any of the projects reported should check professional journals in the appropriate field or write directly to the investigator.

For the Clearinghouse, I wish to thank those who have submitted reports on their own projects and those who have told us of other studies, and to acknowledge the valuable assistance of the Science Information Exchange, and the foundations which provide us with information about their research grants.

To Research Investigators:

This publication is only as complete as you are willing to make it. Page 121 is a form for letting us know of other investigators who are working in the field. Page 118 is a form for reporting your own current research. Please let us hear from you.

Clearinghouse for Research in Child Life

LONG-TERM RESEARCH

Note: The reports in this section concern research programs which are more or less continuous.

22-AA-1 GROWTH, DEVELOPMENT, AND ADAPTATION OF HUMAN INDIVIDUALS

Purpose: To gain greater understanding of many factors involved, prenatal and post-natal, as an individual is in the process of becoming the kind of a person he is as an adult.
Subjects: Approximately 100 middle class families in Denver, Colorado, including 210 offspring of whom over 50 are second generation followed in the institute. (Eighty percent of subjects entered since 1930 are still being followed.)
Methods: Each subject followed from birth at regular intervals studying: (1) pattern of changing structure by direct measurements, X-rays, and photographs; (2) development of personality traits, starting with family during prenatal period and carried on intensively with infant, child, and adult; (3) patterns of physiological development including nutrition, biochemical and physiological tests, and evaluation of healthiness.
Duration: 1927-continuing.
Investigator(s): Robert W. McCammon, M.D., Director, Child Research Council, University of Colorado Medical Center, Denver, Colo. 80220.
Cooperating group(s): University of Colorado; Commonwealth Fund; McDonald Foundation; National Dairy Council; Jones Foundation; Nutrition Foundation; Gerber Company; Lawrence Phipps Foundation; National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Appropriate medical or scientific journals every year. Publication lists available.

Note: Changes have been made in original plans for this study. Analysis is being made of existing data on physical growth, nutrition, radiological studies, and health records of subjects prior to January 1967.

22-AA-2 ANALYSIS AND EVALUATION OF DATA FROM THE LONGITUDINAL STUDY OF CHILD HEALTH AND DEVELOPMENT BASED UPON MULTIDISCIPLINE AND PERIODIC OBSERVATIONS OF INDIVIDUAL CHILDREN FROM BIRTH TO 18 YEARS

Initiation date: 1930.
Investigator(s): Research has been discontinued, but the analyses of data and preparation of reports are being continued by individuals under the direction of Robert B. Reed, Ph.D., Professor and Head, Department of Biostatistics, Harvard School of Public Health, Boston, Mass. 02115.

22-AA-3 LONGITUDINAL STUDY OF CHILD GROWTH AND DEVELOPMENT

Purpose: Program consists of study of adult personality, adjustment, and aging processes of individuals whose health, growth, personality development, and environment have been studied since birth. It included a study of the aging processes of their parents in relation to physical and biochemical measures made earlier. It will include studies of: parental child-rearing attitudes and practices of two generations in the same families; constancy of autonomic response patterns to stress from childhood to young adulthood and their relationship to psychosomatic disorders in adulthood; blood lipids in relationship to body composition and change in composition.
Investigator(s): Lester W. Sontag, M.D., Director, Fels Research Institute for the Study of Human Development, Antioch College, Yellow Springs, Ohio 45387.
Cooperating group(s): Public Health Service, U. S. Department of Health, Education, and Welfare.

22-AA-4 LONGITUDINAL CROSS-CULTURAL STUDY OF HUMAN DEVELOPMENT

Purpose: To observe the long-term effects of environment upon growth and health, that is, the influence of environmental factors upon physical and mental development, and the elucidation of their mode of action and interaction with genetic endowment.
Subjects: Several hundred males followed from pre-puberty, all with four grandparents from the same limited geographical zone of southern Italy but now living in the markedly different cultures of Boston, Rome, and Palermo; other groups of 100 girls and several hundred boys in Florence, Italy and 200 girls in Boston.
Methods: Repeated medical, anthropometric, and psychological examinations together with family interviews (with evaluation of child-rearing practices), nutrition, and socio-cultural data.
Findings: Reported in numerous articles in American and European journals. Current work under analysis includes cross-cultural study of moral values, studies of biological age and its estimation, estimation of socio-economic status across cultures, blood groups and temperament, and changing hemoglobin values in adolescent males. Work involving further and continuing data collection includes prediction of growth variables, cross-cultural study of creativity and its environmental determinants, a study of left-handed subjects in the relatively "permissive" and "intolerant" cultures of the United States and Italy, and an analysis of menstrual symptoms in both cultures.
Duration: 1956-1968.
Investigator(s): Harben Boutourline Young, M.D., Research Associate in Human Growth and Development, Harvard School of Public Health, Boston,

BEST COPY AVAILABLE

Mass. 02115; present address: Harvard Florence Research Project, Via Venezia 10, Florence, Italy.
Cooperating group(s): Grant Foundation; Wenner Gren Foundation; Olivetti Corporation; Universities of Florence, Rome, and Palermo.
Publications: Perceptual and Motor Skills 23:35-40, 1966; Bulletin of the International Epidemiological Association 12:1936, 1965; American Journal of Diseases of Children 106:568-577, 1963; papers and other articles; one book planned, another possible.

22-AA-5 BIOLOGIC AND ENVIRONMENTAL FACTORS IN CHILD DEVELOPMENT

Purpose: To investigate the relationship of biologic, genetic, and environmental factors in the parents--including events during pregnancy, labor, and delivery--to normal and abnormal development of offspring. Expected byproducts of investigation are relationships of these factors to pregnancy wastage in the form of early fetal death, perinatal mortality, infant and childhood mortality, and estimates of incidence of different types of abnormalities. In addition, detailed growth curves for children from birth to six years of age will be derived on a longitudinal basis, also estimates of illnesses and injuries in infancy and the pre-school child.
Subjects: Members of the Kaiser Foundation Health Plan--a pre-paid medical care program--who reside in the San Francisco-East Bay area.
Methods: Study is of a prospective, longitudinal type for both mother and child. Observations are made on the gravidas in the Department of Obstetrics and Gynecology, and on the children in the Pediatric Department, and are supplemented by special interviews and laboratory examinations. Physicians' observations are systematized and made more uniform. Special efforts are made to obtain information on members of study who do not return to the plan for medical care.
Duration: July 1959-indefinite.
Investigator(s): Jacob Yerushalmy, Ph.D., Professor of Biostatistics, School of Public Health, University of California, Berkeley; Stephen Thomas, M.D., Director, Department of Obstetrics and Gynecology, and Edgar Schoen, M.D., Director, Department of Pediatrics, Kaiser Foundation Hospital, Oakland, Calif.
Cooperating group(s): Permanente Medical Group; Kaiser Foundation Research Institute.
Publications: Journal of Pediatrics 71:2:164-172, August 1967; Pediatrics 39:940-941, 1967; American Journal of Obstetrics and Gynecology 88:4:505-518, February 15, 1964; other articles.

22-AA-6 THE BERKELEY (CALIFORNIA) GROWTH STUDY

Purpose: A study of the mental and physical growth of normally healthy persons from birth in 1928-1929 to the present.
Subjects: 60 full-term, healthy newborns, born in Berkeley, California hospitals of white, English-speaking parents, if parents were interested--a somewhat selected above-average group; 140 offspring of these subjects, age range from a few months to about 20 years, seen irregularly, but same data (appropriate for age) collected that were collected for their parents.
Methods: Tests of mental and motor development; pediatric examination; interviews at frequent intervals during growth beginning in first week of life. At all visits, inquiries made concerning current health and

recent illnesses. Anthropometrics, body photographs, and skeletal X-rays taken at most ages. Socio-economic data available. Adult records include mental tests, physical examinations, anthropometrics, and current status interview. Studies of physical aspects of growth include analyses comparing health histories with physical growth and with skeletal maturation. Some parent-child relations in susceptibility to illness could be studied. Emotional and other personality variables studied for consistency, and in various interrelations with maternal behavior in infancy, birth histories, socio-economic status, intellectual and physical growth.
Duration: 1928-continuing.
Investigator(s): Nancy Bayley, Ph.D., and Dorothy H. Eichorn, Ph.D., Research Psychologists, Institute of Human Development, University of California, Berkeley, Calif. 94720.
Publications: Monograph of the Society for Research in Child Development 28, 1963; Growth Diagnosis. Chicago: University of Chicago Press, 1959; Child Development 12:167-173, 1941 and 27:45-74, 1956; others.

22-AA-7 MEDFORD, OREGON BOYS' GROWTH STUDY

Purpose: To construct physical and motor growth curves of boys 7 to 18 years of age; to relate physical and motor traits to physiological maturity, physique type, socio-personal adjustment, interests, and scholastic aptitude and achievement.
Subjects: Cross-sectional samples: 40 boys at each age 9 through 15 years; longitudinal samples: 100 boys at ages 7, 9, 12, and 15 years; tested annually to 18 years.
Methods: Construction of growth and growth acceleration needs; extent of individual differences; contrasting extreme groups on various tests; zero-order, partial, and multiple correlations; factor analysis; multiple regression equations; special studies of athletes; and profile charts of outstanding athletes.
Findings: Contained in 62 master's and doctor's theses to date.
Duration: October 1955-June 1968.
Investigator(s): H. Harrison Clarke, Ed.D., Research Professor of Physical Education, School of Health, Physical Education, and Recreation, University of Oregon, Eugene, Ore. 97403.
Cooperating group(s): Oregon State Education Department; Southern Oregon College; Office of Scientific and Scholarly Affairs, University of Oregon Graduate School; Athletic Institute, Chicago.
Publications: Series of brochures planned, to be published by Prentice-Hall, Inc., Englewood Cliffs, N. J.

22-AA-8 GROWTH OF PSYCHOPHYSIOLOGICAL PATTERNS IN INFANCY

Purpose: To investigate the origins and course of development of individual differences in neonates. (See Research Relating to Children, Bulletin No. 21-AA-8.)
Subjects: Normal, healthy full-term babies, 2 to 5 days old, born at Bronx Municipal Hospital Center.
Methods: A neonatal behavioral profile established in prior studies in this laboratory will be used. This profile includes behavioral and heart rate ratings on excitation, soothing, feeding, sleep, and non-stimulus periods of observation. Neonates will be followed at two weeks, one, two, three, and four months of age to measure the stability of early-appearing traits and their relation to later behaviors.

Findings: Data will be analyzed with respect to stability of early-appearing behaviors and relationship between neonatal behavior and maternal and birth history.
Duration: 1966-continuing.
Investigator(s): Wagner H. Bridger, M.D., Associate Professor of Psychiatry, and Beverly Birns, Ph.D., Assistant Professor of Psychology, Albert Einstein College of Medicine, Yeshiva University, Bronx, N. Y. 10461.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: In Early Experience and Behavior, Grant Newton and Seymour Levine (Eds.). In press, 1968; Psychosomatic Medicine 28:316, 1966; Child Development, September 1965; others.

22-AA-9 PHILADELPHIA CENTER FOR RESEARCH IN CHILD GROWTH

Purpose: To develop standards and norms of physical growth and development of normal, healthy children of the Philadelphia area.
Subjects: White and Negro children, male and female. Data are longitudinal (usually annual), based on two major samples: birth to 7 years, and 6 to 17 years. Cephalometric (measurement of head, face, jaws) and somatometric (trunk, limbs) standards of second group (white, colored) are already available; those of first group (white only) will be within the year.
Methods: Cephalometry and somatometry. Measurements are linear, transverse, sagittal, circumferential, skin thickness (via skin calipers), X-ray films of left hand (routinely) and of upper arm or lower leg (reduced number of cases); also of head and face in norma laterales sinistra and norma faciales (roentgenographic cephalometry). Dental models are taken in most cases. Histories secured are: (1) familial in terms of ethnic background and socio-economic status; (2) medical (illness) and dental (occlusion, dental stage, oral habits); (3) genetic, in terms of the familial occurrence of trait(s) being considered. All data may be referred to several age categories: (1) chronological age (C.A.); (2) dental or eruptive age (D.A.); (3) skeletal or biological age (S.A.). All data have been put on microfilm, coded, and stored in computer memory. (1) School Series: initially based on 600 normal, healthy white school children from five Philadelphia schools, 6 to 12 years of age (ultimately followed to 22 schools). These children have provided the core data upon which our 6- to 17-year standards are based. (2) American Negro Series: based on the semi-annual study of some 500 elementary school children. These children have provided the core data upon which our 7- to 17-year standards are based. (3) Orthodontic Series: now numbering some 2,700 children from the Orthodontic Clinics of the University of Pennsylvania (2,200) and the Children's Hospital (500). All of these children have been followed through their treatment course (2 to 4 years, average). On about 10 percent of them there are post-treatment follow-up studies. (4) Cleft Palate Series: in cooperation with the Children's Hospital. These data are, for the most part, single pre-operative roentgenographic cephalometric, plus selected somatometry (H, W, shoulder B, chest B and D, hip B, etc.). There are some 600 such records; in about 10 percent there are follow-up data. (5) Cooley's Anemia Series: based on some 120 children. Measurements, X-ray films, familio-genetic histories, and therapeutic treatment. Data are longitudinal, on an annual basis. (6) Endocrine and Chromosomal Series: seen on a referral basis from Children's Hospital. Data are follow-up, though sporadically and irregularly so.
Investigator(s): Wilton M. Krogman, Ph.D., LL.D., Director, Philadelphia Center for Research in Child Growth, and Professor and Chairman;

and Francis E. Johnston, Ph.D., Assistant Director, The Center, and Associate Professor of Anthropology, Department of Physical Anthropology; Geoffrey F. Walker, B.D.S., Director of the Philadelphia Center for Cranio-facial Biology, and Research Associate in Orthodontics, Department of Orthodontics, Division of Graduate Medicine, University of Pennsylvania, Philadelphia, Pa. 19146.
Cooperating group(s): Children's Hospital of Philadelphia; Philadelphia Board of Public Education; School System, Archdiocese of Philadelphia; National Institute for Dental Research and National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.

22-AA-10 GROWTH RESEARCH UNIT

Purpose: To gain insight into critical factors influencing growth patterns of all children by observing the growth and development of deviates, especially those with pathological diagnoses which have been medically documented.
Subjects: Children with congenital cardiac lesions, and children and adolescents with significant deviations of physical, neurological, and behavioral development.
Methods: Inspection, anthropometry, photography, X-ray of the left hand and wrist. Analysis of these basic data for current status and for growth trends.
Duration: 1929-1969.
Investigator(s): Leona M. Bayer, M.D., Co-chairman, Youth Clinic, Presbyterian Medical Center, San Francisco, and Adjunct Clinical Associate Professor of Medicine, Stanford University, Palo Alto; and Saul J. Robinson, M.D., 2300 California St., San Francisco, Calif. 94115.
Cooperating group(s): Institute of Medical Sciences; Service for Developmentally Handicapped Children.
Publications: Journal of Pediatrics 62:5:631-645, May 1963; Journal of Clinical Endocrinology and Metabolism 22:1127-1129, November 1962.

22-AA-11 LONGITUDINAL STUDY OF DENTOFACIAL, SKELETAL, AND PHYSICAL GROWTH, AND NUTRITION OF CHILDREN

Purpose: To study the dentofacial growth of children, standards of nutrition, caries increment as related to nutrition, assessment and skeletal age as related to facial growth, variations in physique and its effect on dentofacial growth. Twins are also being studied to determine heritable traits.
Subjects: 400 children, including 40 pairs of twins, ages 3 to 18 years, who have been observed for periods of 3 to 10 years.
Methods: Cephalograms, hand, wrist, and calf X-rays, intra-oral X-rays, study casts, anthropometric measurements, photographs, oral examination, and one-week food diary. Children are examined every six months until 14 years of age.
Initiation date: 1950-continuing.
Investigator(s): Bhim S. Savara, D.M.D., M.S., Professor and Chairman, Child Study Clinic, Dental School, University of Oregon, Portland, Ore. 97201.
Cooperating group(s): Oregon State Board of Dental Examiners; Tektronix Foundation, Inc.; Medical Research Foundation of Oregon; National Dairy Council; National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Growth 31, 1967; Human Biology, May 1967; Archives of Oral Biology 12, 1967; others.

22-AA-12 RADIOGRAPHIC ATLASES OF SKELETAL DEVELOPMENT

Purpose: To develop radiographic standards of skeletal development for use as reference standards for children.
Methods: Series of films of hand, elbow, shoulder, hip, knee and foot of healthy children are used to identify the modal (moderate) rate of bone development. Revisions of the 1955 Knee Standard and the 1959 Hand Standard have been tested since 1965.
Investigator(s): S. Idell Pyle, Ph.D., Research Associate, Department of Anatomy, Western Reserve University School of Medicine, Cleveland, Ohio 44106; and William W. Greulich, Ph.D., Research Biologist, National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda, Md. 20014.
Publications: The Knee Standard is scheduled for publication in 1968.

Note: The Bulletin expects to have more current information on this study in the next issue.

22-AA-13 COLLABORATIVE STUDIES IN CEREBRAL PALSY AND OTHER NEUROLOGICAL AND SENSORY DISORDERS OF INFANCY AND CHILDHOOD

Purpose: To investigate factors and conditions affecting parents: (1) conditions of pregnancy itself, such as infections, trauma, bleeding, drugs, and progress of labor; (2) environmental factors influencing mother, such as social and economic conditions, emotional stress, and medical care; (3) biological factors in parents such as age, parity, medical and reproductive history, and immunologic characteristics; (4) genetic background of parents. To investigate in the offspring: disorders of the nervous system of all products of conception at time of delivery or appearing during infancy or early childhood, including cerebral palsy, mental sub-normality, behavioral disorders, etc. A detailed investigation of the independent variables will be directed toward the re-evaluation of the effect of factors already suspected, the elucidation of the mechanism through which these factors are operative, and the discovery of factors neither presently known nor suspected.
Subjects: Approximately 8,000 live births per year from collaborating institutions for five years. Offspring followed until school age.
Methods: Analysis of pooled information collected in a uniform way in a number of medical centers throughout the country from women studied during pregnancy and from their offspring followed throughout infancy and early childhood. Intensive study of limited number of cases; less intensive study of as many damaged children and abnormal pregnancies as possible.
Initiation date: 1956-continuing.
Investigator(s): Heinz W. Berendes, M.D., National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda, Md. 20014. Collaborating institutions: Charity Hospital, New Orleans, La.; Johns Hopkins University School of Medicine, Baltimore, Md.; Boston Lying-In Hospital and Children's Medical Center, Boston, Mass.; University of Minnesota Medical School, Minneapolis, Minn.; Columbia-Presbyterian Medical Center and New York Medical College, New York, N. Y.; University of Buffalo, Buffalo, N. Y.; University of Oregon Medical School, Portland, Ore.; Children's Hospital of Philadelphia and Pennsylvania Hospital, Philadelphia, Pa.; Brown University, Providence, R. I.; University of Tennessee Medical School, Memphis, Tenn.; Medical College of Virginia, Richmond, Va.
Publications: Bibliography available from Dr. Berendes; in Research

Methodology and Needs in Perinatal Studies, Chapters 5 and 6, S. S. Chipman, A. M. Lilienfeld, B. G. Greenberg, and J. F. Donnelly (Eds.). Springfield, Ill.: Charles C. Thomas, 1966; Summary of Progress in Collaborative Perinatal Research (A Nationwide Mother-Child Study), Public Health Service Research Profile No. 9, PHSP No. 1161, 1964.

22-AA-14 METHODS IN CHARACTER DEVELOPMENT

Purpose: To develop more effective methods in character development in cooperation with families and character training agencies. (Character is defined in terms of three dimensions: philosophy of values, breadth of social vision, and strength of purpose.)
Subjects: Children and families throughout the United States. These are in churches, YMCA's, and schools, and participate as individual families.
Methods: The methods of development are based on action research, in which the participants cooperate with the laboratory, using methods of co-scientist research. Open-ended reports on research goals constitute the basic body of research data. An analysis of this data serves as the basis for the development of new procedures and for the scientific reports which are published concerning it.
Findings: Reports have been prepared concerning hypotheses being tested in the home and character-building agencies. Most of the findings relate to the home, learning, decision-making, and methods for character development, plus descriptions of age-level potentials, especially for decision-making.
Initiation date: 1935-continuing.
Investigator(s): Ernest M. Ligon, Ph.D., Director, Leona J. Smith, Ph.D., Research Associate, and staff, Union College Character Research Project, 10 Nott Terrace, Schenectady, N. Y. 12308.
Cooperating group(s): Lilly Endowment, Inc.
Publications: Character Potential: A Record of Research; How to Stand Up for What You Believe, Herbert J. Detweiler. New York: Association Press, 1966; The Marriage Climate, Ernest M. Ligon and L. J. Smith. St. Louis, Mo.: Bethany Press, 1963; others.

GROWTH AND DEVELOPMENT

General

22-BA-1 ABERDEEN CHILD DEVELOPMENT PROJECT

Purpose: To determine the relative contribution of obstetric, social, and educational influences to development and particularly, to the later emergence of handicaps.
Subjects: The 14,000 children born between October 1951 and September 1955, resident in Aberdeen in December 1962.
Methods: Detailed case notes relating to their births are available for 11,820 of the children. Further information has been collected on their parental and social background, school progress and achievement, levels of intellectual functioning, and physical and mental health.
Duration: Not reported.
Investigator(s): Raymond Illsley, Professor, Department of Sociology; Gordon Horobin, and D. J. Oldman, Sociologists, and W. R. Bytheway, Statistician, Medical Sociology Research Unit, University of Aberdeen, Foresterhill, Aberdeen, Scotland.
Cooperating group(s): Association for the Aid of Crippled Children.

22-BA-2 STUDIES OF INTELLECTUAL AND PERSONALITY DEVELOPMENT OF CHILDREN FROM CULTURALLY DEPRIVED BACKGROUNDS

Purpose: To investigate the intellectual and personality development of children who have been subjected early in life to disadvantages and traumatic experiences.
Subjects: Children, ages three and four, enrolled in Head Start nursery classes in the Greater Washington area.
Methods: Analysis of learning environments of pre-school children; studies of cognitive, social, and personal characteristics; studies of inter-relationships between personality characteristics and cognitive styles, between language development and impulse control (capacity to modulate motor activity and the expression of aggressive impulses, and delay gratification) and between specific environmental variables and intellectual and personality development. Data are obtained through standardized tests and natural and structured situational observations. Capacity to delay gratification and inhibit motor activity is being studied in an experimental situation; data on other aspects of impulse control, ego functions, and coping behavior are obtained through direct observation.
Duration: 1967-1969.
Investigator(s): Leon J. Yarrow, Ph.D., Chief, and Michael Fishman, M.D., Psychiatrist, Social and Behavioral Sciences Branch, National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda, Md. 20014.

22-BA-3 BEHAVIORAL, INTELLECTUAL, AND PSYCHOPHYSIOLOGICAL CORRELATES OF THE HYPERACTIVE SYNDROME IN CHILDREN

Purpose: To investigate cognitive disabilities and parameters affecting learning in hyperactive children; to study the psychophysiological correlates of hyperactivity.

Subjects: Hyperactive children, ages 8 to 13.

Methods: Data are collected from a battery of cognitive tests, classroom observations, and psychophysiological measures, including galvanic skin response, heart rate, and finger tremor.

Duration: 1962-1969.

Investigator(s): Virginia I. Douglas, Ph.D., Associate Professor of Psychology, McGill University, and Senior Psychologist, Montreal Children's Hospital, Montreal, Quebec, Canada.

Cooperating group(s): Medical Research Council.

Publications: Book in preparation, 1967.

22-BA-4 ORIGINS AND DEVELOPMENT OF DIFFERENTIATION

Purpose: To trace longitudinally the precursors and development of psychological differentiation.

Subjects: Newborn infants and their parents.

Methods: Infants are observed for physiological and behavioral development and followed for three years. Two home visits are made to observe the mother-infant interaction in the "comforting situation". Tests of perceptual field-dependence and other indicators of psychological differentiation are administered to parents and to children at age two-and-one-half to three years.

Duration: September 1966-August 1971.

Investigator(s): Rita W. Clark, M.D. (D.M.S. Candidate), Instructor, Department of Psychiatry, State University of New York, Downstate Medical Center, Brooklyn, N. Y. 11203.

Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

22-BA-5 DEVELOPMENTAL PSYCHOPHYSIOLOGY

Purpose: To investigate spontaneous fluctuations in physiological response systems, habituation of orienting responses, differentiation of physiological responses, and the development and extinction of conditional responses as a function of the aging process.

Subjects: Boys, ages 7 to 8, whose parents have some form of psychosis.

Methods: EDR and vasomotor activity are recorded bilaterally while back of hand is stimulated with cool and warm air.

Duration: Not reported.

Investigator(s): John A. Stern, Ph.D., Professor of Psychology, and Director of Research, and Jon M. Plapp, Ph.D., Research Associate, Behavior Research Laboratory, Washington University, St. Louis, Mo. 63104.

Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

22-BA-6 LONGITUDINAL GROWTH OF INDIAN CHILDREN

Purpose: To develop normative data on Indian infants.
Subjects: Infants, ages 1 to 15 months; sample to be expanded to include urban lower economic group, four castes in village, and sample from a pediatric clinic.
Methods: Testing program using Bayley Infant Scales should lead to conclusions on reliability and validity of Bayley Scale in Indian culture, normative data on motor and mental development at various months for well children and those with certain diseases, and should make possible cross-cultural comparisons of motor and mental development.
Duration: December 1966-December 1968.
Investigator(s): Promila Phatak, Ph.D., Research Director, Child Development Program, Faculty of Home Science, M.S. University of Baroda, Baroda 2, Gujaret, India.
Cooperating group(s): Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.

22-BA-7 THE INFLUENCE OF CHRONIC DISEASE ON THE ADOLESCENT DEVELOPMENTAL PERIOD

Purpose: To study the effect of chronic medical diseases on the biological, physiological, and psychological development of adolescents; to eventually plan long-term medical-social-educational goals for these patients.
Subjects: All patients, ages 13 to 19, enrolled in the Adolescent Outpatient Service and/or admitted to the Adolescent Inpatient Unit of the Montefiore Hospital and Medical Center.
Methods: Group therapy is provided for a number of patients with rheumatic heart disease who present delinquency problems to the Adolescent Cardiac Clinic; a weekly peer group-oriented seminar-conference is held with adolescent females with severe exogenous obesity; complete anthropometric, biochemical, and psychological evaluation is made of all adolescents with chronic diseases such as asthma, diabetes, ulcerative colitis, collagen disease, chronic renal disease, etc., to ascertain the major areas of debilitation. This will be a multiple disciplinary approach employing a physician, research psychologist, and medical social worker in conjunction with medical house staff and nursing personnel from the Adolescent Unit of the Montefiore Hospital and Medical Center.
Duration: September 1967-September 1969.
Investigator(s): Michael I. Cohen, M.D., Director, Adolescent Unit, Montefiore Hospital and Medical Center, and Assistant Professor of Pediatrics, Albert Einstein College of Medicine, Yeshiva University; and Sheila Weinberg, Ph.D., Research Social Psychologist, Division of Pediatrics, Montefiore Hospital and Medical Center, Bronx, N. Y. 10467. (Reported by Laurence Finberg, M.D., Division of Pediatrics, Montefiore Hospital and Medical Center.)
Publications: Publication planned in appropriate medical periodicals.

Physical

22-CA-1 RESEARCH INTO FACTORS INFLUENCING CHILD GROWTH AND DEVELOPMENT IN AN AGRICULTURAL POPULATION IN JAMAICA

Purpose: To study the development of rural Jamaican children; to attempt to pinpoint the time at which growth faltering occurs, and to determine its likely causes.
Subjects: Children under age five in a representative rural population at Lawrence Tavern, Jamaica.
Methods: Present study is semi-longitudinal and supplements a longitudinal study of infants born in the same area between November 1962 and October 1963. Routinely collected anthropometric data are related to detailed information obtained concurrently on background, diet, illnesses, and child care.
Duration: 1964-not reported.
Investigator(s): Dr. W. E. Miall, Director, H. G. Lovell, Statistician, and Miss P. Heneage, Assistant Statistician, Medical Research Council's Epidemiological Research Unit; Dr. K. L. Standard, Senior Lecturer, Social and Preventive Medicine Department; and H. I. McKenzie, Sociologist, University of the West Indies, Mona, Kingston 7, Jamaica.
Cooperating group(s): Association for the Aid of Crippled Children.

22-CC-1 THE DEVELOPMENT OF AUDITORY DISCRIMINATION

Purpose: To test the hypothesis that children from disadvantaged environments will have greater difficulty in making auditory discriminations than will their middle class counterparts.
Subjects: 30 middle and 30 lower class males each from the first, third, and fifth grades, each group of 30 consisting of 15 Negro and 15 white boys.
Methods: A battery of auditory perceptual discrimination measures and one visual discrimination measure are administered. Scores on perceptual measures are compared with reading scores and group intelligence test (Lorge-Thorndike) scores; group differences are evaluated. Implications will be drawn for both the auditory hypothesis and the relationship between perceptual discrimination skill and reading at different age levels.
Duration: Not reported.
Investigator(s): Cynthia P. Deutsch, Ph.D., Institute for Developmental Studies, School of Education, New York University, New York, N. Y. 10003.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

22-CF-1 DENTAL ATTITUDE FORMATION AND PREVENTIVE CARE UTILIZATION

Purpose: To evaluate the relationship between child and maternal dental attitude at various ages, and attitude of children with varying dental experiential backgrounds; to evaluate children exposed to an "ideal" treatment experience with regard to pre- and post-treatment attitude; to evaluate preventive care-oriented practices of children treated under experimental program.

Subjects: Low through middle-middle income children, ages 8 to 12.
Methods: Structured interviews are held with mothers and children. A dental history is obtained and the child examined, with physiological monitoring during dental treatment.
Duration: September 1966-August 1968.
Investigator(s): Jack W. Howitt, D.D.S., Research Associate and Associate Pedodontist, Eastman Dental Center, 800 Main St. E., Rochester, N. Y. 14603.
Cooperating group(s): National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Publications planned.

22-CF-2 THE CHRONOLOGICAL SIGNIFICANCE OF DENTAL AND ORAL DEFECTS AND THEIR RELATIONSHIP TO NEUROLOGICAL AND DEVELOPMENTAL ABNORMALITIES

Purpose: To clarify relationship of developmental dental abnormalities to neurological and physical maldevelopment.
Subjects: Patients attending the Children's Evaluation and Rehabilitation Clinic of Albert Einstein College of Medicine.
Methods: Complete dental, neurological, and psychological studies with correlations of findings so as to identify time of insult to the organism, types of resultant neurological and dental defects, and relationship to other developmental anomalies.
Findings: The incidence of developmental dental defects appears to be higher in a neurologically abnormal population and occurs concomitantly with other more general developmental anomalies. Dental defects are often useful chronologic markers and may provide helpful diagnostic information for determining time and type of insult to the developing organism.
Duration: February-November 1967.
Investigator(s): Harold Diner, D.D.S., Assistant Professor, and Herbert J. Cohen, M.D., Assistant Professor of Clinical Pediatrics, Albert Einstein College of Medicine, Yeshiva University, Bronx, N. Y. 10461.
Cooperating group(s): Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.
Publications: Eventual publication planned.

22-CG-1 MOTOR SKILLS OF YOUNG CHILDREN: SEX DIFFERENCES

Purpose: To determine the effect of sex upon the performance of children on the rotary pursuit task, and the interactions of sex with grade and socio-economic class (school neighborhood) in predicting rotary pursuit performance.
Subjects: 128 elementary school children from an upper-middle class school and a lower class, inner-city school.
Methods: Each subject was given an individually administered session of five two-minute trials with a one-minute rest period between. The sex of the experimenter was systematically controlled. (Procedures were essentially the same as those described in Davol et al., *Perceptual and Motor Skills* 21:351-357, 1965.)
Findings: Preliminary analyses of the data indicate that there was some interaction between sex of experimenter and task difficulty (speed of rotation), and that sex differences were stronger in the performances of children in the lower socio-economic school.
Duration: February 1966-July 1967.

Investigator(s): Stephen H. Davol, Ph.D., Assistant Professor, Department of Psychology and Education, Mount Holyoke College, South Hadley, Mass. 01075.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: To be published in Perceptual and Motor Skills.

22-CH-1 AN EXPERIMENTAL STUDY OF THE EFFECT ON BABBLING OF VISUAL INTERACTION BETWEEN MOTHER AND INFANT

Purpose: To test Mowrer's autism theory of speech development in which he proposed that the infant's babbling is self-reinforced and self-gratifying, therefore not requiring a reaction from others for its continuation; to determine whether the frequency and duration of babbling vary with experimentally controlled visual interaction between mother and infant.
Subjects: 35 males and 25 females, ages 4 to 12 months; controls.
Methods: The babbling of the infants was tape recorded and measured under three test conditions: (1) absence of visual interaction (mother was seated in a different room from subject and remained silent until test condition was finished); (2) partial visual interaction (mother was seated three feet from infant, silently reading in full view of the subject, but not responding to subject's activity); (3) total visual interaction (mother was seated three feet from subject facing the infant, neither communicating verbally, smiling, nor nodding, but continuing to look at him until the test condition was finished). These conditions were presented in six randomized orders. Experimental design included controls for the intervening variables of fatigue, hunger, and physical discomfort. The frequency and duration of babbling in the three test conditions were compared to show whether babbling is independent of the infant's surroundings.
Findings: No significant differences were found among the experimental conditions. Infants did not babble more when alone or in the two presence conditions. Babbling seems to be independent of the infant's visual surroundings. Mowrer's autism theory as tested by this investigation is supported.
Duration: October 1965-May 1967.
Investigator(s): James Edward Parker, Ph.D., Center for the Study of Speech and Hearing, University of Southern California, Los Angeles, Calif. 90007. (Reported by William H. Perkins, Ph.D., Director, Center for the Study of Speech and Hearing.)
Publications: Copy of dissertation available in the University of Southern California Library.

22-CH-2 A STUDY OF SOME ASPECTS OF THE PLAY OF THREE- AND FOUR-YEAR-OLDS WHO HAVE DELAYED SPEECH

Purpose: To compare the play of nursery school children who have delayed speech, but who are otherwise normal, with that of a control group; to establish relationships between language and play; and to analyze the speech of the speech-retarded group.
Subjects: 3- and 4-year-old nursery school children; control group matched on a number of variables.
Methods: Each child was observed during play for four hours, the play being categorized under three conceptual frameworks. Each utterance was recorded, and the utterances of the speech-retarded group were analyzed

in terms of the rules for phrase structure grammar proposed by members of the Harvard Language Acquisition Board.
Findings: The play of three-year-old speech-delayed pupils differs only a little from that of normal speaking children. There are increasing differences from age four; mean number of morphemes per utterance correlates highly with amount of time spent in advanced forms of play.
Duration: July 1966-1967.
Investigator(s): K. Lovell, Ph.D., Reader in Education, University of Leeds, Leeds 2, England.
Publications: To be submitted for publication.

Intellectual

22-DA-1 PATTERNS OF INTELLECTUAL DEVELOPMENT DURING CHILDHOOD AND ADOLESCENCE

Purpose: To study the changes in structure and mental abilities at different ages as represented by performance on the Wechsler Intelligence Scale for Children (WISC); to interpret and possibly modify current theories of cognitive and psychomotor development in the light of these changes.
Subjects: 400 children, ages 5 to 16, selected at random from the school population.
Methods: WISC is administered at ages 5, 7, 9, 11, 13, and 15, and data are analyzed by means of appropriate factor analytic techniques at the various age levels.
Duration: May 1967-August 1968.
Investigator(s): Mohammed Y. Quereshi, Ph.D., Associate Professor of Psychology, Marquette University, Milwaukee, Wis. 53233.
Publications: Publication planned.

22-DA-2 A DEVELOPMENTAL APPROACH TO SPACE LOCALIZATION

Purpose: To investigate the interaction between perceptual and cognitive factors, and the changes in their relationship during development.
Subjects: Children, ages 5 to 15.
Methods: Areas of study include changes in size transposition with changes in physical dimensions or changes in labeling of correct responses during training; systematic developmental changes in the nature of transfer in situations which allow for generalization along either a perceptual or conceptual dimension; and two-person communication games involving transmission of information about spatial relationships.
Findings: Transposition is affected by intra- as well as inter-pair differences. Systematic developmental changes in the nature of transfer are obtained.
Duration: June 1966-May 1969.
Investigator(s): Joseph A. Glick, Ph.D., Assistant Professor of Psychology, Yale University, New Haven, Conn. 06520.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Papers in preparation, 1967.

22-DA-3 PRE-SCHOOL PROJECT

Purpose: To trace the development of educability in children during the first six years of life; to trace the role of experience in such development.
Subjects: Approximately 50 normal children each year, from birth to age six, selected for diversity along several dimensions such as ethnicity, intelligence, social class, and pre-school setting.
Methods: Approach is longitudinal and cross-sectional. Naturalistic observations are used to generate developmental inventories of tasks which pre-school children face, coping behaviors, abilities, and environmental saliencies. Hypotheses about the development of educability are being generated by this procedure and will be tested through further observation and experimental studies.
Findings: Tentative identification has been made of social and non-social abilities which distinguish very able from inept six-year-old children.
Duration: September 1965-continuing.
Investigator(s): Burton White, Ph.D., Director, Frances Litman, M.Ed., Assistant Director, E. Robert LaCrosse, Ph.D., Daniel Ogilvie, Ph.D., and Patrick Lee, Ph.D., Research Associates, Pre-school Project, Laboratory of Human Development, Harvard Graduate School of Education, Cambridge, Mass. 02138.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Publication planned for 1968; interim reports available.

22-DB-1 ANALYSIS OF COGNITIVE GROWTH OF CHILDREN AS SHOWN IN THEIR ORAL DISCUSSION AND WRITTEN COMPOSITIONS

Purpose: To provide evidence of logical abilities of children at different grade levels in elementary school.
Subjects: Children in grades two to six.
Methods: Children's compositions produced in four different writing situations are analyzed; taped oral discussions are compared with written work.
Findings: Results will yield information on (1) types of logical tasks children at different grade levels from two through six may reasonably be expected to accomplish; (2) types of linguistic expressions children use which indicate their place on the cognitive growth scale; (3) range of cognitive abilities apt to be found within an ordinary classroom at each grade level; (4) possible effects of prolonged experience under the Nebraska English Curriculum upon certain kinds of writing at each grade level; (5) whether a child's scores on standard I.Q. and Achievement Tests in Reading and Language may be considered an indication of his stage of cognitive growth; and (6) types of questions children in grades two through six write down during spare school time.
Duration: Not reported.
Investigator(s): Paul A. Olson, Ph.D., Professor of English, and Co-Director, and Elizabeth T. Carpenter, Ph.D., Content Analyst, Nebraska Curriculum Development Center, University of Nebraska, Lincoln, Neb. 68508.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

22-DB-2 THE CHILD'S LINKS BETWEEN TOUCH, VISION, AND THOUGHT

Purpose: To investigate conditions affecting cross-modal recognition and cross-modal transfer; to explore the role of handling in children's identification of objects and assignment of meaning to objects.
Subjects: Kindergarten, second, and fourth grade children.
Methods: A variety of perceptual and cognitive tasks.
Findings: From a comparison of uses for objects under conditions of looking and handling, it appears that kindergarten children give more, and more varied, uses for objects when allowed to handle as well as look at them.
Duration: September 1966-September 1969.
Investigator(s): Jacqueline J. Goodnow, Ph.D., Associate Research Professor of Psychology, George Washington University, Washington, D. C. 20006.
Cooperating group(s): Montgomery County, Md. Department of Education; National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: To be submitted to Child Development.

22-DB-3 FAMILY INTERACTION AND COGNITIVE DEVELOPMENT

Purpose: To develop a brief, untaxing method by which to study parent-child interaction in a cognitive task, which may then be analyzed both quantitatively and qualitatively.
Subjects: Ten "normal" males, ages seven to eight, with I.Q.'s ranging from 95 to 110 as measured by the WISC, and their parents, all of lower class and residing in the same geographical area.
Methods: Child is pre- and post-tested twice on five tasks; two testings are at least one week apart. Between pre- and post-testing, child is "taught" the task by each parent. Tasks include: Piaget's conservation of substance and test of "all and some" class inclusion; cartoon stories involving assessment of parent-child interaction; the "Fox and the Grapes" fable; and either the "glass houses" or "rolling stone" proverb.
Findings: Most of the "normal" parents used very clear language and concepts in teaching their children what was involved in the tasks. In two families this was not so, and in both, the child was having difficulty at school.
Duration: July 1966-October 1967.
Investigator(s): Loren R. Mosher, M.D., Assistant Professor of Psychiatry, Yale University Medical School, New Haven, Conn. 06519.
Cooperating group(s): Sociologic Research Unit, University of London, London, England; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Results available from Dr. Mosher.

22-DB-4 THE EFFECTS OF SOCIALIZATION ON COGNITIVE SKILLS

Subjects: Rural and suburban children residing in Baltimore County, Md.
Methods: Data are obtained through administration of a questionnaire, projective tests, classroom observations, and observation of parent-child interaction in the home.
Duration: September 1967-September 1969.
Investigator(s): Doris R. Entwisle, Ph.D., Associate Professor of Social Relations and Engineering Science, and Ellen Greenberger, Ph.D.,

Research Associate, Center for the Study of the Social Organization of Schools, Johns Hopkins University, Baltimore, Md. 21218.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Results will be published as reports of the Center for the Study of Schools and as journal articles.

22-DB-5 A STUDY OF SOME COGNITIVE AND NEUROLOGICAL DIFFERENCES IN BACKWARD AND NORMAL READERS

Purpose: To compare the intercorrelations between test scores on variables in a sample of backward and normal readers; to determine whether a link exists between reading disability and neurological impairment, at least in the case of some backward pupils.
Subjects: 50 backward readers, ages 9 to 10, with an I.Q. over 85; control group of normal readers matched on several variables.
Methods: Cognitive and neurological tests were administered to all subjects, and test scores were intercorrelated separately.
Findings: In the backward readers, reading age was strongly linked to auditory-visual integration and motor efficiency (Oseretsky Revised Test). Factor scores enabled the selection of pupils who were most likely to be backward due to neurological impairment.
Duration: September 1965-1967.
Investigator(s): K. Lovell, Ph.D., Reader in Education, and A. Gorton, M.A., Senior Lecturer in Education, University of Leeds, Leeds 2, England.
Publications: Submitted for publication.

22-DC-1 A FRESH APPROACH TO PRE-SCHOOL EDUCATION AND AN EVALUATION OF ITS EFFECTIVENESS

Purpose: To determine the effectiveness of a pre-school program based on teaching children how to learn.
Subjects: Two matched groups of 23 lower-middle class five-year-olds.
Methods: Experimental group was exposed to the "Learning to Learn Program", which utilizes game-like activities which motivate and enable the children to progress through the motor-perceptual-symbolic stages. Emphasis is on principles of cognitive development, and materials were developed in a sequential order based on the assumption that development proceeds from motor to perceptual to symbolic levels. Program centers on process of learning rather than on content. Control group received more traditional methods of pre-school training, and both groups were evaluated at end of year.
Findings: Experimental group made significantly larger gains than control group on 15 of the 17 developmental measures taken. Differences were large enough to be of practical as well as statistical significance.
Duration: September 1966-November 1967.
Investigator(s): Herbert Sprigle, Ph.D., Director, Learning to Learn School, Vernon Van De Riet, Ph.D., Assistant Professor, Department of Clinical Psychology, and Hani Van De Riet, Ph.D., University of Florida, Gainesville, Fla. 32601.
Cooperating group(s): Carnegie Corporation.
Publications: To be submitted for publication.

22-DC-2 A LONGITUDINAL ASSESSMENT OF PRE-SCHOOL CHILDREN IN HAPTIC LEARNING

Purpose: To study the development of haptic perception and the retention of learning in subjects who have completed an experimental program of planned learning activities involving haptic perception.
Subjects: Children, ages three to six.
Methods: Plywood forms of geometric design are presented haptically to subject who is asked to identify, describe, and draw each form, to match the forms haptically, and to select the representation of each form from among a group of drawings. Test is repeated with each child at intervals of 6 and 12 months. Data are examined in relation to chronological and mental age, time elapsed since completion of experimental program, and other factors.
Duration: December 1965-February 1968.
Investigator(s): Sister John Vianney Coyle, Ph.D. Candidate, and Sister Josephine Concannon, Professor, School of Education, Boston College, Chestnut Hill, Mass. 02167.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

22-DC-3 FACTORS INVOLVED IN EARLY SCHOOL LEARNING DIFFICULTIES

Purpose: To discover any statistically significant relationships between learning skills and neurological, psychological, environmental, or psychiatric status after three years of school; to determine the extent to which maturational lags in sensory, motor, social and intellectual areas shown in pre-schoolers may have been resolved by age eight or nine in the normal course of events at school and in the home.
Subjects: 64 nine-year-old children and their parents; control group.
Methods: One hundred forty-two children were given a complete battery of tests of general intelligence, manual and drawing skills, and projectives in the summer of 1964 prior to entering kindergarten. Those who showed pre-school difficulties in visual-motor coordination, figure-ground discrimination, and/or visual organization were followed up three years later. Comprehensive developmental history includes further psychological and achievement tests, neurological examination, administration of Purdue Perceptual Motor Survey and Frostig tests, an EEG, including photic and hyperventilation, and a stereotyped psychiatric interview with the child. In addition, the mother provides developmental and medical history of the child, is interviewed by the social worker, and answers two standard questionnaires regarding family interaction.
Duration: Summer 1964-January 1968.
Investigator(s): Anne Bell, B. Paed., M.A., Psychologist, and W. Wallace Grant, M.D., Director, Child Development Clinic, Children's Hospital, and Professor of Pediatrics, University of Manitoba, Winnipeg, Manitoba, Canada.
Cooperating group(s): Manitoba Hospital Commission; Department of Psychology, University of Manitoba.
Publications: Manitoba Psychologist 8:1, October 1966; conclusions will be published in appropriate professional journals.

22-DC-4 AN EXPERIMENTAL ANALYSIS OF LEARNING ABILITIES IN CULTURALLY DISADVANTAGED CHILDREN

Purpose: To devise methods of assessing learning abilities in culturally disadvantaged children; to provide training in techniques of mnemonic elaboration which have already been shown experimentally

to facilitate paired-associates learning; eventually, to adapt these techniques of facilitation of learning to instruction in the content of the primary school curriculum.
Subjects: Elementary school children, ages 4 to 11, from high and low socio-economic status levels.
Methods: Children are tested individually on a battery including Perceptual-Motor Learning-to-Learn, Perceptual-Motor Speed, Short-Term Memory, Attentional Ability, Free Recall, Serial Learning, Paired-Associate Learning, and Conceptual Learning, all of which are adapted for appropriate difficulty at each age level. Results should give age range throughout which each test yields reliable individual differences.
Duration: February 1967-September 1968.
Investigator(s): Arthur R. Jensen, Ph.D., Professor of Education and Research Psychologist, and William D. Rohwer, Jr., Ph.D., Assistant Professor of Education and Assistant Research Psychologist, School of Education, University of California, Berkeley, Calif. 94720. (Reported by Dr. Douglas A. Penfield, Assistant Research Educator, School of Education.)
Publications: Formal report to be issued at completion of project.

22-DD-1 RESPONSE PATTERNING OF MINIMALLY BRAIN-INJURED CHILDREN ON THE WECHSLER INTELLIGENCE SCALE FOR CHILDREN

Purpose: To determine sources of variability and commonality of WISC sub-test scores of minimally brain-injured children; to determine if the response patterning of this group is distinctive and, if so, how this knowledge can be used in diagnosis and treatment.
Subjects: 250 children in classes for perceptually handicapped children in the Memphis City Schools with a mean age of 10.7 years and a standard deviation of 1.58.
Methods: Factor analysis of WISC sub-scales yielding both a principal components solution and a varimax rotation.
Duration: October 1967-February 1968.
Investigator(s): David C. Tanis, M.S., Coordinator of Research, Memphis City Schools, 2597 Avery Ave., Memphis, Tenn. 38112.
Publications: Results to be stored with Educational Resources Information Center (ERIC), Office of Education, U. S. Department of Health, Education, and Welfare; to be published in a professional journal.

22-DE-1 SENSORY-MOTOR EXPERIENCE AND CONCEPT FORMATION IN EARLY CHILDHOOD

Purpose: To determine whether there is a relationship between sensory-motor experience in early childhood and concept formation, and whether there are motoric and non-motoric modes that children employ in solving means-ends situations. Specifically, to test hypotheses that (1) the motorically handicapped will show a deficit of action concepts to object concepts in their concept repertoire, which is related to their restricted sensory-motor experience; (2) children will utilize, predominately, a motoric or non-motoric mode of dealing with means-ends situations; (3) the handicapped group will show deficits in tactile and motor perception.
Subjects: One group of motorically handicapped children, age four-and-one-half, and a control group.
Methods: Sensory-motor learning theories of Piaget and Hebb provide a theoretical basis for study. The two groups are compared for acquisition of simple action and object concepts. Two picture-type tests are constructed to test the first two hypotheses.
Duration: Not reported-Spring 1967.

Investigator(s): Robert F. Peck, Ph.D., Department of Educational Psychology, and Donald Melcer, School of Education, University of Texas, Austin, Tex. 78712.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

22-DE-2 EVALUATION OF CONCEPT ATTAINMENT IN THE PRE-SCHOOL CHILD

Purpose: To evaluate the level of concept attainment in pre-school children and to program individualized experiences in keeping with levels of development; to train inner-city mothers to carry out classroom observations and record and subsequently rate concept attainment.
Subjects: 750 children, ages three-and-one-half to four-and-one-half, from Project Headstart Child-Parent Development Center.
Methods: Mothers have been trained to observe and rate the children on Allerhand's Concept Attainment Rating Scale, based on various theories of concept formation. Teachers plan individualized experiences for the children based on their developmental levels, through various teacher training methods.
Duration: October 1966-January 1968.
Investigator(s): Melvin Allerhand, Ph.D., Director, Division of General Studies, and Carole Levy, M.S., Psychologist, Western Reserve University, Cleveland, Ohio 44106.
Cooperating group(s): U. S. Office of Economic Opportunity.
Publications: Information available from Carole Levy.

22-DF-1 PROBLEM-SOLVING PROCESSES USED BY ELEMENTARY SCHOOL BOYS

Purpose: To investigate how elementary school children at different ages and at different levels of ability solve problems of specified logical structure when using different modes of presentation.
Subjects: Boys, ages 7 to 12.
Methods: In individual testing sessions subjects are given problems that they must solve by asking questions. After each question is asked, the corresponding information is given. The experimenter records the questions in sequence, and analyzes them by experimental and traditional methods. Variables subject to experimental manipulation are age, ability level, logical structure of the problems, mode of presentation, and grade level.
Duration: 1966-1970.
Investigator(s): H. J. A. Rimoldi, M.D., Ph.D., Professor of Psychology, and Director, Psychometric Laboratory, and Kenneth Vander Woude, Research Associate, Loyola University, Chicago, Ill. 60626.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

22-DF-2 A COMPARISON OF ACTIVITIES DESIGNED TO PROMOTE LOGICAL EXPRESSION IN CHILDREN

Purpose: To determine effectiveness of training programs which teach parents how to utilize reading materials or games as means for increasing logical expression in their children.
Subjects: 42 Negro families with a mother or mother-substitute and one five-year-old child.

Methods: Families were randomly divided into two experimental and one control group. Experimental groups used either reading materials or games with weekly assistance of investigator, who served as a teaching model for the parent. Pre- and post-test data include verbal and non-verbal measures of logical expression from the children; verbal reports from parents on child guidance techniques which they would use in specified behavioral situations; and observational check lists of the teaching style of the parent in a standard situation.
Duration: September 1966-September 1967.
Investigator(s): Therry N. Deal, Ph.D., Assistant Professor of Child Development, School of Home Economics, University of Georgia, Athens, Ga. 30601. (Reported by Elizabeth T. Sheerer, Ph.D., Head, Department of Family Development, School of Home Economics.)
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Results available through Research and Development Center, University of Georgia; journal publication planned.

22-DG-1 PERCEPTUAL DEVELOPMENT IN YOUNG CHILDREN

Purpose: To develop visual, auditory, tactual, kinesthetic, and other instruments for assessing perceptual development in the age range of three to nine years; eventually, to define a set of measurement operations by which pre-school development may be meaningfully related to early school progress.
Subjects: 15 children at each of seven age levels, attending the University Schools.
Methods: Pre-recorded test materials are administered to groups where possible, with increasingly smaller groups at the lower end of the age range. Instruments used relate to current major theories of cognitive development.
Duration: September 1967-June 1968.
Investigator(s): Edward Gotts, Ph.D., Assistant Professor and Research Coordinator, Institute for Child Study, University Schools, Indiana University, Bloomington, Ind. 47401. (Reported by William W. Lynch, Ph.D., Chairman, Department of Educational Psychology, School of Education, Indiana University.)
Publications: Publication planned.

22-DG-2 DEVELOPMENT OF ATTENTIONAL PROCESSES

Purpose: To determine whether there is a change with age in the extent to which an individual can ignore task-relevant information and can take in task-relevant information when stimulation is complex, and, if so, to determine whether these changes depend upon development of the ability to make use of a preparatory set; to investigate role of sense-organ orientation in the utilization of preparatory set in auditory perception.
Subjects: Children, ages 5 to 14; adults, ages 59-84.
Methods: Subject listens to taped auditory messages in which two voices speak simultaneously. Subject is instructed either to select one voice or to report them successively with order specified.
Findings: The children improved in selective listening; improvement did not depend upon increasing utilization of preparatory set, although the availability of a preparatory signal did improve selective listening at all the ages studied. The utility of the preparatory signal did not depend upon ear orientation, but appeared to be central.

BEST COPY AVAILABLE

Duration: September 1964-August 1967.
Investigator(s): Eleanor E. Maccoby, Ph.D., Professor of Psychology, and Director, Laboratory of Human Development, Stanford University, Stanford, Calif. 94305.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Monograph of the Society for Research in Child Development 112:32:4, 1967; in Advances in Child Development and Behavior, Vol. 3, Lipsitt and Spiker (Eds.), 1967.

22-DG-3 INTERPERSONAL PERCEPTION OF PRE-SCHOOL CHILDREN

Purpose: To investigate at what age the pre-school child becomes capable of perceiving the needs and feelings of other people; to develop ways of helping him to become increasingly aware of the world of the other so that he can use this information in his social interactions.
Subjects: 20 three- and four-year-old children of middle class professional parents, enrolled in the Carnegie-Mellon Child Development Laboratory.
Methods: Several techniques have been utilized to measure the child's awareness of the other person's perspective, as in ability to select appropriate gifts for familiar people, and awareness of how other children would feel as presented in a hypothetical situation. Techniques will be tested for validity by correlating them with teachers' ratings of social perceptiveness and evidence of such perceptiveness in a behavioral observation made of each child. Different approaches will be used to increase the child's awareness of the other's point of view and to help him apply it to interpersonal situations (e.g., teachers suggest that children tell one another how they feel during disagreements; parents are encouraged to listen to the child's point of view and share theirs with him, etc.), and change will be measured.
Findings: Tentative findings indicate that middle class children as young as three are quite accurate in their perception of how other children feel in various situations.
Duration: September 1967-September 1968.
Investigator(s): Helene Borke, Ph.D., Assistant Professor of Child Development and Psychology, Carnegie-Mellon University, Pittsburgh, Pa. 15213.
Publications: Plan to publish in an appropriate journal.

22-DH-1 PERCEPTUAL VERSUS MOVEMENT RESPONSES IN THE ACQUISITION OF VERBAL SYMBOLIC CONCEPTS BY DEPRIVED CHILDREN

Purpose: To contrast efficiency of verbal concept learning in disadvantaged children when taught through perceptual means with that taught through use of music or children's own highly differentiated movement responses.
Subjects: 156 four-year-old Negro children enrolled in a summer pre-kindergarten program.
Methods: Subjects were divided into perceptual, movement, and control groups. Perceptual group, taught by Montessori methods, and movement group were taught the same series of symbolic verbal concepts using either perceptual or movement responses. Children received 20 minutes of training three times a week for four weeks.

Findings: Both treatment groups were significantly better in verbal concept understanding and use than the control group; movement group was significantly better than the perceptual.
Duration: Summer 1967-completed.
Investigator(s): Marcia Guttentag, Ph.D., Assistant Professor of Psychology, Queens College, Flushing, N. Y. 11367.
Cooperating group(s): New Haven, Conn. Project Headstart; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Paper presented at Eastern Psychological Association Meeting, Washington, D. C., April 1968; publication planned.

Personality

22-EA-1 AN EXPLORATORY INVESTIGATION OF CERTAIN PERSONALITY CHARACTERISTICS AT GRADES SEVEN AND TWELVE IN SELECTED SCHOOLS

Purpose: To identify certain personality characteristics of students in specified school environments.
Subjects: Students in grades 7 through 12 in four secondary schools in New York State.
Methods: California Psychological Inventory was administered to the same students in seventh and twelfth grades, and results were compared.
Findings: Two of the four schools showed more change than stability. Significant differences between high- and low-ranked groups at grade seven increased over the five-year period in three of the four schools.
Duration: January 1963-June 1967.
Investigator(s): F. Douglas Bowles, Ed.D., Associate Professor of Education, State University of New York, Oneonta, N. Y. 13820.
Cooperating group(s): Quality Measurement Project, New York State Department of Education.
Publications: Plan to publish in psychological and sociological journals, 1968.

22-EA-2 EFFECT OF FETAL ACTIVITY ON APPREHENSION AND AGGRESSION

Purpose: To study the relationship between fetal activity, and social apprehension and peer aggression when mother-child interaction variables are controlled.
Subjects: 80 expectant mothers and their children.
Methods: Mothers are selected on basis of prenatal care, socio-economic background, intact homes, race, and non-smoking. Fetal activity is recorded by mothers for the last two-and-one-half months of pregnancy. Following the birth of the infants, several measurements will be taken, including activity ratings of the infants, Gesell Developmental Schedules, Social Apprehension and Peer Aggression Scales, Overt Peer Aggression, Love-Hostility and Acceptance-Rejection Scales, and Mother-Child Interaction Test (measuring over-protectiveness). Kendall rank-order correlations will be obtained for each sex between fetal activity and social apprehension, and between fetal activity and two measures of peer aggression, with mother-child interaction variables held constant.
Duration: January 1967-1971.

Investigator(s): C. Etta Walters, Ph.D., Associate Professor, Institute of Human Development, and James Walters, Ph.D., Professor and Head, Home and Family Life, Florida State University, Tallahassee, Fla. 32306.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

22-EA-3 THE INFANT'S REACTIONS TO THE STRANGER

Purpose: To arrive at a more precise and complete description of the infant's reactions when he meets a person whom he has never seen before; to determine the psychological nature and meaning of those reactions.
Subjects: Normal infants in Montreal, ages 6 to 15 months.
Methods: Observation is made of infant's motor, visual, vocal, and expressive reactions to an experimenter who behaves according to a predetermined schedule. For the purpose of interpreting those reactions, there is a tentative assessment of the infant's cognitive development, based on Piaget's genetic model, and his relationship to his mother.
Findings: Preliminary findings indicate that negative reactions to the stranger do not seem to be a general phenomenon among infants, at least not until about the end of the first year.
Duration: June 1966-1972.
Investigator(s): Thérèse Gouin Décarie, D.Ph., Professor, Institute of Psychology, University of Montreal, Montreal 3, Quebec, Canada.
Cooperating group(s): The Canada Council.
Publications: *Canadian Psychologist* (*Psychologie Canadienne*) 8-a:2:157, April 1967.

22-EA-4 PSYCHOENDOCRINE STUDIES OF ADOLESCENT BEHAVIOR

Purpose: To study the correlation of endocrine function with behavior and social function in adolescent males.
Subjects: Five groups of adolescent males: acting-out aggressive; acting-out aggressive with brain damage; passive-withdrawn; passive-withdrawn with brain damage; normal with regard to each of these conditions.
Methods: Three-day pools of 24-hour urine samples are collected periodically over three months, including time of admission; these are processed and stored with subsequent analysis for 17-hydroxycorticosteroid, epinephrine, norepinephrine, aldosterone, androgen, estrogen, and pepsinogen. Concomitantly, complete medical examination, interview, life history, projective testing, and daily observations are performed in order to provide social and behavioral data for correlation with identified endocrine patterns.
Findings: Data on 55 youths studied to date suggest increased lability of endocrine functions as compared to older populations, exaggerated patterns of excretion in either direction in adolescents with brain damage, and correlations between behavioral styles during periods of social stress and patterns of endocrine function.
Duration: 1962-1968.
Investigator(s): Jacob R. Fishman, M.D., Center for Mental Health, Howard University College of Medicine, Washington, D. C. 20001.
Cooperating group(s): U. S. Army.

22-EB-1 DEVELOPMENT STUDY OF THE SELF-IMAGE

Purpose: To determine whether it is possible to differentiate stages in the development of the self-image.
Subjects: Children, ages 6 to 12.
Methods: Intensive interviews are conducted to determine conceptions of the self in present and future; change and development of self-values; changing self-picture which the individual desires to project to the world; emergence of self-awareness and self-consciousness; changes in degree of preoccupation with the self; emerging clarification of the distinction between committed and idealized images; content of the present, committed, and idealized images; development of the superego emphasizing the content of moral judgments about the self; changing sensitivity to external evaluation; development of ego-extensions; stability of the self-image at different stages; and other aspects of the self-image.
Duration: Not reported.
Investigator(s): Morris Rosenberg, Ph.D., Social Science Analyst, Laboratory of Socio-environmental Studies, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Chevy Chase, Md. 20203.

22-EB-2 SELF-EVALUATION, BIRTH ORDER, AND PESSIMISM

Purpose: To investigate some of the supposed determiners of self-confidence.
Subjects: Boys, ages 7, 12, and college-age.
Methods: Each subject works at a task with experimentally controlled feedback of information about the rate of improvement in his performance. He periodically estimates his probability of success in terms of his chances of driving his performance up to a fixed "required" level at least once in the 10 trials allowed.
Findings: Optimistic attitude, i.e., if the reward for doing a good job is valuable to me, then I am more likely to succeed, is characteristic of later-born, low-self-evaluating college students, and to a lesser degree, of similar 12-year-old boys. Pessimistic attitude is characteristic of all other groups.
Duration: September 1965-continuing.
Investigator(s): James C. Diggory, Ph.D., Professor and Chairman, Department of Psychology, Chatham College, Pittsburgh, Pa. 15232.
Cooperating group(s): Pittsburgh parochial schools.
Publications: Paper presented at Eastern Psychological Association Meeting, Washington, D. C., April 1968.

22-EB-3 RACIAL DIFFERENCES IN EGO FUNCTIONS RELEVANT TO ACADEMIC ACHIEVEMENT

Purpose: To explore the hypotheses that (1) the ego functions of sense of personal control and willingness to delay gratification are significantly related to academic achievement; and (2) Negro children score significantly lower on measures of both ego function variables.
Subjects: 237 eighth graders (182 white, 55 Negro) and 321 eleventh graders (288 white, 33 Negro).
Methods: All subjects were given two seven-item scales, one measuring sense of personal control and the other, willingness to delay impulse gratification. Three sets of analyses of variance and covariance (with I.Q. as covariate) were performed: (1) sex and race as independent

variables, academic grade point average (GPA) as a dependent variable; (2) ego function variables as independent, GPA as dependent variable; and (3) sex and race independent, ego function variables dependent.
Findings: Both hypotheses were supported. However, the ego function variables appeared to influence academic achievement largely through their association with intelligence. The racial differences on the ego function variables were interpreted as contributing to a vicious cycle, with the Negro child's intellectual and psychological handicaps interacting.
Duration: April-October 1967.
Investigator(s): Elise E. Lessing, Ph.D., Senior Research Associate, Institute for Juvenile Research, 232 E. Ohio St., Chicago, Ill. 60611.
Publications: Report to be published in professional journal.

22-EB-4 EGO DEVELOPMENT IN SOCIALLY DISADVANTAGED FOUR-YEAR-OLDS

Purpose: To explore the spectrum of salient ego functions for four-year-olds in a socially disadvantaged area; to attempt clinical assessment for use in nursery school intervention; to relate children's personality functions to family and community characteristics.
Subjects: 30 male children enrolled in a research nursery school for socially disadvantaged youngsters.
Methods: The children were interviewed and observed by two child psychiatrists. Clinical observations and standardized techniques were utilized to evaluate ego functions of various kinds.
Findings: It was found that organization and content of play were important factors in determining quality of ego functioning; that verbal facility was not as useful a predictor; that capacities for interpersonal relationships are also good indicators of functioning.
Duration: May 1966-July 1968.
Investigator(s): Jay G. Hirsch, M.D., Chief, Division of Preventive Psychiatry, Institute for Juvenile Research, 232 E. Ohio St.; and Gene H. Borowitz, M.D., Associate Professor of Psychiatry, University of Illinois College of Medicine, Chicago, Ill. 60612.
Cooperating group(s): Kenneth F. Montgomery Foundation.
Publications: Reports presented at Meeting of Society for Research in Child Development, March 1967, and at American Orthopsychiatric Association Meeting, March 1968; articles to be published in journals.

22-EC-1 ANIMAL SYMBOLISM IN CHILDHOOD

Purpose: To investigate the animal choices of children in an effort to develop a normative scale to be used in psychodiagnostic interviews.
Subjects: 200 children each, equally divided by sex, from kindergarten through grade 12, in a school district of a small New England city.
Methods: Each class was interviewed. The children were asked to write down the name of the animal they would most like to be, as well as the name of the animal they would dislike being. Results are analyzed in relationship to age and sex.
Duration: January 1967-January 1968.
Investigator(s): Raymond Sobel, M.D., Professor and Director, Division of Child Psychiatry, Dartmouth Medical School, Hanover, N. H. 03755.

22-ED-1 EFFECTS ON AGGRESSION OF FILMED VS. LIVE SANCTIONS

Purpose: To assess: (1) the role of co-observer's differential sanctions on subsequent performance of aggression; (2) the role of expectancies in determining the performance of film-mediated aggression; and (3) the difference in the aggressive performance between males and females.
Subjects: 42 boys and 42 girls, ages 60 to 105 months, with a mean age of 84 months.
Methods: Each child was individually shown a film containing an adult male behaving aggressively. A male co-observer provided either positive, negative, or no evaluation of this performance during its presentation. The co-observer subsequently accompanied half of the subjects to an experimental room where their imitative behavior was scored for a 15-minute period.
Findings: (1) Co-observer's positive, negative, or neutral sanctions have differential effects on subsequent performance of aggression; (2) differential effects occur only when the individual sanctioning the behavior remains with the children during performance opportunities; (3) girls perform less aggressively than boys, but the relative effects of various sanctions are the same between sexes.
Duration: September 1964-completed.
Investigator(s): David J. Hicks, Ph.D., Associate Professor of Psychology, Chico State College, Chico, Calif. 95926.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Submitted to Child Development.

22-EE-1 HYPNOTIC SUSCEPTIBILITY IN FRATERNAL AND IDENTICAL TWINS, AND IN CHILDREN AND THEIR PARENTS

Purpose: To compare hypnotic susceptibility between sets of identical and fraternal twins in an effort to isolate genetic and environmental factors in the development of responsiveness to hypnosis; to investigate similar factors in children and their parents, with the addition of relating the child's score to his parents' in terms of like-sex, identification, etc.
Subjects: Volunteer families from the community, specifically the Mothers of Twins Club, which provides a large part of the twin sample.
Methods: Stanford Hypnotic Susceptibility Scale, Form A, is administered and information obtained on age, sex, education, occupation, and birth order of family members. Objective hypnotic susceptibility scores are compared.
Duration: June 1966-June 1969.
Investigator(s): Ernest R. Hilgard, Ph.D., Professor of Psychology, Stanford University, Stanford, Calif. 94305. (Reported by Arlene Morgan, Staff Associate, Laboratory of Hypnosis Research, Department of Psychology.)
Publications: Plan to publish in 1969.

22-EF-1 DETERMINANTS OF EARLY PLAY BEHAVIOR

Purpose: To explore the roles of anxiety and the desire for competence in determining children's play behavior.
Subjects: Children, ages 5 to 10.
Methods: Children are observed at play in school and at the doctor's office.
Duration: September 1967-August 1968.

Investigator(s): J. Barnard Gilmore, Ph.D., Associate Professor of Psychology, University of Waterloo, Waterloo, Ontario, Canada.
Cooperating group(s): The Canada Council.

22-EG-1 ANIMAL FIGURES IN DREAMS: AGE, SEX, AND CULTURAL DIFFERENCES

Purpose: To discover the type and frequency of various animal figures in several samples of dreamers.
Subjects: 520 dreams from 457 American children; 4,000 dreams from 801 American adults; and 554 dreams from 247 cross-cultural adults, including Australian aborigines, South Pacific and North American Indians.
Methods: Dreams were analyzed for manifest content, and types of animals present were tallied. Dreams containing animals were also compared with those in which no animals appeared.
Findings: Four-year-old children dream about animals 61 percent of the time, and adults seven to eight percent. Between these age extremes there is a rank order correlation of +1.00 between chronological age and the frequency of animal dreams. Children dream of different animals than adults. Sex and cultural differences are present in the type of animals dreamed about.
Duration: Not reported.
Investigator(s): Robert L. Van de Castle, Ph.D., Associate Professor of Psychology, Department of Psychiatry, University of North Carolina Medical School, Chapel Hill, N. C. 27514.
Publications: Monograph planned in Journal of Consulting Psychology.

Social

22-FC-1 SMOKING EDUCATION AND EVALUATION PROGRAM

Purpose: To test hypothesis that certain attitudes and knowledge held by school children about smoking are predictive of actual smoking behavior; to determine the effects of an intensive program in smoking information on smoking attitudes, beliefs, and practices.
Subjects: Children in kindergarten through high school in two separate matched school districts of 3,000 students each; control groups of children in two additional school districts.
Methods: Students in one district are given an intensive educational program designed to increase knowledge about smoking, change attitudes and beliefs in a direction unfavorable to smoking, and decrease actual smoking behavior. A questionnaire will be administered before, during, and after the program. Corollary studies will include a survey of attitudes, beliefs, and smoking behavior of teachers in the districts; a study of sub-groups of students in relation to their ability to delay gratification, their habits of arousal-seeking, and their mode of reinforcement (external versus internal); and a check of the reliability of responses on the questionnaire, especially in the primary grades.
Duration: July 1966-July 1971.
Investigator(s): Richard L. Grant, M.D., Instructor in Psychiatry, University of Oregon Medical School, Portland, Ore. 97201.
Cooperating group(s): Tuberculosis and Health Association of Oregon; Oregon Heart Association; American Cancer Society, Oregon Division; Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Cigarette Smoking and School Children: The Beginning of a Longitudinal Study, Richard L. Grant and Morris Weitman. Chicago: Aldine Publishing Company, in press, 1967.

1212

22-FD-1 IMITATION IN CHILDREN AS A FUNCTION OF INTERPERSONAL ATTRACTION

Purpose: To determine (1) whether the relationship between attitude similarity and attraction to another person holds true for young children as it does for older children and adults; and (2) whether differences in attitude similarity (and therefore interpersonal attraction) affect the degree of the child's imitation of the other person.
Subjects: 32 children, ages four to five-and-one-half, attending the Washington State University nursery school.
Methods: Children are individually introduced to an adult female who is the model. Examiner explains that he wants to find out what things people like, and that he will first ask the child and then ask the model about the same things. He then asks 12 questions such as, "Is it all right for children to cry at nursery school?" and "Do you like ice cream?" The model agrees with the attitudes expressed by half the subjects, and disagrees with the remainder. She then leaves, while the Examiner determines the child's attraction toward her. The model returns to "play with some things," then the child is given a turn to play. His imitation of four acceptable and four unacceptable things the model did is noted, as well as his use of four things the model did not use.
Findings: Means indicate higher interpersonal attraction and higher imitation in the 100 percent agreement group.
Duration: April-June 1967.
Investigator(s): Marshall L. Hamilton, Ph.D., Assistant Professor, Department of Child and Family Studies, Washington State University, Pullman, Wash. 99163.
Publications: If results are significant, plan to submit to *Journal of Personality and Social Psychology*.

22-FD-2 MODELING AS A FACTOR IN THE INTERNALIZATION OF SOCIAL STANDARDS

Purpose: To test the hypothesis that subjects can abide by behavioral standards that they have observed or have had imposed on them without having the "investment in" or "commitment to" those standards that is characterized by internalized standards.
Subjects: 29 boys and 25 girls, ages 8-6 to 10-6, in third and fourth grades in the Tenafly, N. J. public schools.
Methods: Children were first exposed to a model who rewarded and punished herself for her performance on a particular task; then, under conditions of non-surveillance, the children were given an opportunity to reward and punish themselves for their performance on the same task. After a series of trials, a second person entered and, as the subject continued to perform the task, meted out either stricter or more lenient rewards or punishments to the child. Finally, the children were given a second opportunity to perform alone and to self-reinforce or punish their own performance.
Findings: Under-punishment and over-reward tended to result in decreased rule adherence, while over-punishment and under-reward showed no change or slight decreases in rule adherence.
Duration: Spring-Fall 1967.
Investigator(s): Harvey A. Hornstein, Ph.D., Assistant Professor of Psychology, and Peter Gumpert, Ph.D., Assistant Professor, Teachers College, Columbia University, New York, N. Y. 10027.
Cooperating group(s): National Science Foundation.
Publications: Indefinite.

SPECIAL GROUPS OF CHILDREN

Physically Handicapped

22-GC-1 THE EFFECT OF CYSTIC FIBROSIS ON THE SOCIAL FUNCTIONING OF ADOLESCENT AND YOUNG ADULT PATIENTS

Purpose: To evaluate (1) the social functioning of adolescent and young adult cystic fibrosis patients, and (2) the resources available to and the kinds of help needed for those patients who seem to have educational, economic, and social relationship difficulties that conflict with their overall future potential.
Subjects: 12 adolescent cystic fibrosis patients.
Methods: Interviews with subjects are recorded. Material is examined and analyzed to determine current problems, universal characteristics, and future needs. Model of the normal adolescent role developed by Erik H. Erikson is utilized to compare cystic fibrosis patients to the normal adolescent and young adult.
Duration: Not reported-1968.
Investigator(s): David W. Callagy and Thomas G. Gallagher, Social Work Department, Clinical Center, National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda, Md. 20014.

22-GC-2 NEUROLOGIC AFFECTATIONS IN APHASIA

Purpose: To structure a kinesthetic method to develop verbal reactions in aphasia.
Subjects: 10 children, ages 6 to 12, at various levels of aphasian syndrome.
Methods: Use of speech methods associated with training of the deaf.
Findings: Motor training is closely associative in speech training. An involuntary verbal reaction is desirable.
Duration: December 1966-December 1967.
Investigator(s): Ann Reid, Ph.D., Coordinator of Special Education, Oklahoma City Public Schools, 1134 N.W. 8th St., Oklahoma City, Okla. 73106.
Cooperating group(s): Child's Study Center, Oklahoma City.
Publications: Plan to publish.

22-GC-3 INSTRUMENTATION FOR NASALITY AND ORAL COORDINATION

Purpose: To broaden the existing theoretical construct relative to examining relationships between speech competency and structural impairment in cleft palate individuals; to develop instrumentation to measure nasality and oral coordination.
Subjects: Children with hypernasal voice and cleft palate.
Methods: Development of the necessary electronic instrumentation to measure nasality and oral coordination.

Duration: January 1967-December 1968.
Investigator(s): Samuel G. Fletcher, Ph.D., Professor and Head, Department of Audiology-Speech Pathology, Utah State University, Logan, Utah 84321.
Cooperating group(s): Easter Seal Research Foundation; Cleft Palate Team at Primary Children's Hospital.

22-GC-4 DEVELOPMENT OF TESTING PROCEDURES FOR ASSESSING COORDINATION DEFECTS OF CHILDREN WITH MINIMAL BRAIN DYSFUNCTION

Purpose: To refine the assessment of coordination deficits usually considered as neurological "soft signs".
Subjects: 60 children diagnosed as having central nervous system dysfunction; 60 children without such a diagnosis.
Methods: Comparison of normal subjects and those with central nervous system dysfunction on the Diagnostic Testing Instrument, which is a compilation of those procedures described in neurological literature as tests for "soft signs".
Findings: Several of the "soft sign" indices in use by neurologists do not appear to differentiate the two groups, while others definitely do.
Duration: September 1967-June 1968.
Investigator(s): George DeHaven, B.S., R.P.T., Chief Physical Therapist, and John B. Mordock, Ph.D., Coordinator of Research, The Devereux Foundation, Institute for Research and Training, Devon, Pa. 19333.
Publications: Findings to be presented at Annual Meetings of American Physical Therapy Association and American Psychiatric Association; also plan to publish in appropriate journals.

22-GC-5 EVALUATION OF TWO MEASURES OF SPEECH HEARING FOR HEARING-IMPAIRED CHILDREN

Purpose: To assess the function of hearing-impaired children with the Threshold by Identification of Pictures test and the Discrimination by Identification of Pictures test.
Subjects: 200 peripherally hearing-impaired children, ages 5 to 12.
Methods: The TIP and DIP materials are presented using taped stimuli following standard field presentation techniques. Data for discrimination using the DIP are obtained at levels of 5dB, 10dB, and 25dB above threshold, as established with the TIP test. Comparisons of three forms of the DIP and two forms of the TIP will be made, and results compared to a normative study completed in 1966.
Duration: June 1966-June 1968.
Investigator(s): George S. Haspiel, Ph.D., Assistant Director, and Bruce M. Siegenthaler, Ph.D., Director, Speech and Hearing Clinic, Pennsylvania State University, University Park, Pa. 16802.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: To be submitted to a national journal in communication disorders and presented at a convention of the American Speech and Hearing Association.

22-GC-6 INVESTIGATION OF INTELLIGENCE OF EPILEPTIC PATIENTS AND THEIR FAMILIES

Purpose: To assess the differences between the intellectual functioning of the epileptic and members of his family; to evaluate the relationship between electroencephalographic and intellectual functioning in the epileptic and in his family.
Subjects: 20 children referred to the Michigan Epilepsy Center for diagnostic evaluation or recommendations because of suspected seizures or an actual seizure disorder, and their families. Only those families were chosen in which all siblings and parents agreed to cooperate in the study assessment procedures.
Methods: Either the Stanford-Binet, WAIS or WISC (depending upon age), and EEG's were administered to all members of the family, including the patient. In addition, parents were administered the Manifest Anxiety, Shaw Pseudo-Neurological, and Hovey Brain Damage Scales, as well as the Parental Attitude Research Instrument.
Findings: Preliminary findings indicate that in those cases with a confirmed diagnosis of convulsive disorder, the epileptic child falls, on the average, from 10 to 15 points below the mean I.Q. of the remainder of the members of his family. In cases of suspected convulsive disorder, only 50 percent of the subjects had lower I.Q.'s than the mean I.Q.'s of their families.
Duration: January 1966-continuing.
Investigator(s): Ernst A. Rodin, M.D., Director of Medical Research, and Melvin L. Schwartz, Ph.D., Chief of Neuropsychology, Michigan Epilepsy Center, 10 Peterboro, Detroit, Mich. 48201.

22-GC-7 AN INTEREST INVENTORY FOR THE BLIND

Purpose: To develop an interest inventory made up entirely of items which form part of the jobs or recreational activities of legally blind persons, beginning with the early teens.
Subjects: Blind teenagers who are beginning to plan for post-high school years.
Methods: Test to be administered has three sections: activities suited to persons of limited ability and/or education, activities suited to those in or considering professional training, and activities in art, music, and outdoor fields which offer limited opportunity but may represent intense interests for blind people. Items have been selected chiefly from job descriptions of subjects of study because they were working in the professions or in clerical, industrial, and service jobs. Items have been studied and equated for level of difficulty and refined to the most effective phrasing. Norms will be obtained by administering the test to persons already in the fields covered. Test may be administered in whole, or in sections.
Duration: September 1966-September 1968.
Investigator(s): Mary K. Bauman, M.S., Director, Personnel Research Center, 1604 Spruce St., Philadelphia, Pa. 19103.
Cooperating group(s): Committee for Research on Problems Related to Blindness; The Rauch Foundation.
Publications: To be published in either New Outlook for the Blind or International Journal for the Education of the Blind.

22-GE-1 A HOME TEACHING PROGRAM FOR PARENTS OF VERY YOUNG DEAF CHILDREN

Purpose: To demonstrate value of a parent-oriented program for deaf children in which a model home facility is used by trained teachers of the deaf to show parents the ways in which the daily life activities in the home can be the source of stimulation for the child in his use of hearing and development of language.
Subjects: 56 families with deaf children under age three.
Methods: Following medical, audiological, psychological, and social service evaluation, parents enroll with their child in a weekly instruction program geared toward helping them to understand the handicap of deafness and to help the child become accustomed at an early age to utilizing residual hearing and to attempting to communicate through development of aural and oral language. Hearing aid use is begun almost immediately, and audiological maintenance is carried on with instruction program. Parents meet once monthly at night for group sessions led by two clinical psychologists, and one night a month for instruction series of lectures by audiologists, teachers, psychologists, physicians, etc.
Duration: February 1966-January 1969.
Investigator(s): Freeman McConnell, Ph.D., Professor of Audiology, and Director, Bill Wilkerson Hearing and Speech Center, Vanderbilt University, Nashville, Tenn. 37212.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Plan to publish parents' manuals on communication skills by end of 1968; additional articles to appear in professional journals.

22-GE-2 AMELIORATION OF THE MINIMAL BRAIN DAMAGE SYNDROME

Purpose: To study whether a group discussion program with mothers of newborns with a high incidence of minimal brain damage will help reduce the incidence of the behavioral and neurological manifestations of this syndrome.
Subjects: 100 premature infants, with birthweight of two-and-one-half to four pounds; their families.
Methods: The Parental Attitude Research Instrument and a socio-economic scale are employed to determine assignment of mothers to a group discussion program held periodically during infants' first year. Infants are studied for neurological and behavioral development and followed up at six months, one, two, four, and five years with neurological examinations, psychological tests of intelligence, perceptual, and perceptual-motor function, and with electroencephalograms.
Duration: April 1967-April 1972.
Investigator(s): Jack Arbit, Ph.D., Associate Professor of Psychology, and George K. Yacorzynski, Ph.D., Professor of Psychology, Department of Neurology and Psychiatry, Northwestern University Medical School, Chicago 60611; Beatrice Tucker, M.D., Medical Director, Chicago Maternity Center, Chicago, Ill.
Cooperating group(s): Chicago Wesley Memorial Hospital; Office of Research and Demonstrations, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.
Publications: Plan to publish in appropriate pediatric, neurological, and psychological journals.

Mentally Retarded

22-HA-1 THE TOTAL CARE OF BLIND RETARDED CHILDREN

Purpose: To study the incidence of a double handicap of blindness and retardation; to evaluate the associated behavioral abnormalities and their relation to lack of occupation, and the need for adequate stimulus in programming for these children.
Subjects: Blind retarded children known to the Department of Mental Health and the Royal Children's Hospital, Melbourne.
Methods: Evaluation of histories; physical and psychological examinations.
Duration: 1962-1966.
Investigator(s): David Pitt, M.D., Pediatrician, Children's Cottages Training Centre, Kew, E.4, Victoria, Australia.
Publications: Submitted to Medical Journal of Australia.

22-HB-1 A SCIENTIFIC STUDY OF ASSESSMENT PROCEDURES AND THE ESTABLISHMENT OF A THERAPEUTIC PROGRAM FOR TRAINABLE RETARDED CHILDREN

Purpose: To assess current methods of evaluating the retarded child, with a view to therapeutic programming in a pre-school unit for trainable retarded children, the eventual goal being to establish a program which could be extended into the community.
Subjects: 10-14 pre-school trainable retarded children, ages 4 to 6, functioning at a 2- to 2 1/2-year level; their parents.
Methods: Development of systematized methods for collecting data concerning the use of a team process in assessing and establishing a pre-school therapeutic program.
Findings: Progress found in subjects which exceeds that expected had they not participated.
Duration: July 1967-not reported.
Investigator(s): Frederick W. Lundell, M.D., Psychiatrist and Director, and Mrs. R. Lippsett, M.S.W., Ph.D., Administrative Coordinator, Mental Assessment and Guidance Clinic, Montreal Children's Hospital, Montreal 25, Quebec, Canada.
Cooperating group(s): Quebec Association for Retarded Children; Canadian Association for Retarded Children.
Publications: Several preliminary papers have been published and are available on request.

22-HC-1 THE IDENTIFICATION OF BEHAVIORAL AGGRESSION IN THE MENTALLY RETARDED

Purpose: To identify behavioral aggression in the retardate.
Subjects: 60 mentally retarded male adolescents with I.Q.'s above 50 and a modal C.A. of 14 years attending a summer camp; 36 institutionalized male retardates with I.Q.'s between 40 and 50.
Methods: Flanagan's Critical Incident Technique and the Sonoma Checklist were used by five raters to assess behavioral aggression over a period of five weeks.
Findings: 46 items on the Sonoma Checklist differentiated at a statistically significant level those children identified as behaviorally aggressive.

Duration: June 1966-October 1967.
Investigator(s): George Domino, Ph.D., Assistant Professor of Psychology, Fordham University, Bronx, N. Y. 10458.
Publications: Training School Bulletin, 1967.

22-HC-2 EFFECTS OF A MODIFIED ADMINISTRATION OF THE BENDER-GESTALT TO MENTAL RETARDATES

Purpose: To ascertain the degree of improvement in visual-motor reproduction with decrease in distraction.
Subjects: Mentally retarded children.
Methods: Bender-Gestalt is administered in AB-BA design under experimental and controlled reproduction conditions; Peabody Picture Vocabulary and Frostig tests are also given.
Duration: September 1966-June 1967.
Investigator(s): Robert M. Allen, Ph.D., Professor of Psychology, University of Miami, Coral Gables, Fla. 33124.
Cooperating group(s): Hope School; Sunland Training Center; Child Development Center, Department of Pediatrics, University of Miami.
Publications: To be submitted for publication.

22-HE-1 CONTEXTUAL CUES IN THE VERBAL LEARNING OF RETARDATES AND NORMAL CHILDREN

Purpose: To investigate the conditions under which stimuli become functional in verbal learning tasks; to compare retarded and normal individuals with respect to their use of various relevant cues.
Subjects: Mentally retarded adolescents and normal elementary school children.
Findings: The effect of context cues is dependent upon the meaningfulness or discriminability of the primary stimuli. Retardates are less likely to effectively employ context cues in verbal learning situations.
Duration: June 1966-May 1968.
Investigator(s): Alfred A. Baumeister, Ph.D., Associate Professor of Psychology, University of Alabama, University, Ala. 35486.
Cooperating group(s): Partlow State School and Hospital; National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Articles submitted to psychological journals, 1967.

22-HE-2 ODDITY LEARNING IN RETARDATES

Purpose: To determine the effect of double responding (touching or nearly touching the stimulus before responding to a remote site) under the condition of Stimulus-Response discontiguity; to compare the performance of the group instructed to double respond with that of a group learning under S-R contiguity and with another learning under S-R discontiguity but without double responding.
Subjects: 36 students from "slow learners" classes of the seventh, eighth, and ninth grades of Francis Junior High School, Washington, D. C., divided into three groups of 12 subjects each and matched for M.A. as determined by the Peabody Picture Vocabulary test; M.A.'s ranged from 7-8 to 10-8, with a mean M.A. of 9-70, C.A.'s, from 13-11 to 16-5, with a mean C.A. of 14.99.

Methods: Subjects were presented with a three-choice oddity discrimination task.
Findings: The group instructed to double respond learned the problem most efficiently, as measured by mean trials and errors to criterion. The group presented the problem under the control condition of S-R contiguity learned more efficiently than the S-R discontiguity group, but not as well as the double responding group. The differences among the three groups were all statistically significant. Findings indicate that the technique of Double Responding is effective in promoting proficient discrimination learning under conditions of S-R discontiguity.
Duration: November-December 1966.
Investigator(s): Richard A. Wunderlich, Ph.D., Associate Professor of Psychology, Catholic University, Washington, D. C. 20017.
Cooperating group(s): Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.
Publications: Plan to publish in appropriate psychological journal; in Proceedings of the American Psychological Association Annual Meeting, 1967.

22-HE-3 TITRATION AND DOUBLE RESPONDING AS TECHNIQUES PROMOTING PROFICIENT LEARNING IN RETARDATES

Purpose: To determine the relative effectiveness of the techniques of Double Responding (DR), Titration (T), and Double Responding plus Titration (DR + T) under conditions in which Stimulus and Response were spatially discontiguous by an 18-inch vertical distance.
Subjects: 72 retardates, ages 14 to 30, from schools and workshops in Washington, D.C. metropolitan area, divided into six groups and matched for M.A. by Peabody Picture Vocabulary test. Mean M.A. was 9.70 with a range of .28.
Methods: Subjects were presented with a two-choice discrimination under conditions of DR, T, and DR + T. Performance was compared with that of subjects under control conditions of learning with total contiguity (C-0), with S-R discontiguity of 18 inches without any of the specified techniques (C-18), and minimal discontiguity, a S-R separation of less than one inch (C-<1).
Findings: Findings indicate that the techniques of DR, T, and DR + T promote proficient discrimination learning under a discontiguous condition in which Stimulus and Response were separated by 18 inches in the vertical plane as compared to the level of efficiency in learning at this separation without employing these techniques.
Duration: July-October 1966.
Investigator(s): Richard A. Wunderlich, Ph.D., Associate Professor of Psychology, Catholic University, Washington, D. C. 20017.
Cooperating group(s): Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.
Publications: In Proceedings of The American Psychological Association Annual Meeting, 1967.

22-HE-4 LEARNING SET EFFICIENCY IN MENTALLY RETARDED CHILDREN

Purpose: To test Harlow's hypothesis that a small number of trials per problem in the early stages of learning set (LS) formation should produce minimal interproblem improvement and that a larger number of trials per problem should result in significant amounts of early interproblem learning; also, that later in the training, maximum interproblem gain should be achieved in relatively few trials per problem.

Subjects: 31 educable mentally retarded children with I.Q.'s ranging from 53 to 77.
Methods: Seventeen subjects were placed in a criterion training group and 14 in a fixed trials group. Learning set task administered was the object-quality discrimination problem. During the experimental period, the fixed trials training group received three trials per problem and 10 problems per day. Criterion training group also received 30 training trials per day for five days, but each discrimination problem was presented for either a maximum of 20 trials or until the subject reached the criterion of nine out of 10 consecutive correct responses. After receiving 150 training trials each, both groups were presented with 50 additional three-trial problems.
Findings: Preliminary results tend to confirm Harlow's hypothesis of the superiority of using larger numbers of trials per problem early in the learning.
Duration: July 1967-January 1968.
Investigator(s): Melvin E. Kaufman, Ph.D., Associate Professor of Rehabilitation Psychology, University of Wisconsin, Madison, Wis. 53706.
Cooperating group(s): University of Wisconsin Research and Training Center in Mental Retardation.
Publications: To be submitted to American Journal of Mental Deficiency.

22-HG-1 EARLY LANDMARKS OF DEVELOPMENT WITH A YOUNG DOWN'S SYNDROME NEW ZEALAND POPULATION

Purpose: To study patterns among a group of patients with Down's syndrome, noting physical disability, chromosomal patterns, dermatoglyphics, availability of community services, etc.; to study incidence of Down's syndrome among Maoris, which, at present, is lower than for any reported ethnic group; to develop a table predictive of future potential for professionals dealing with young Down's syndrome children.
Subjects: 230 children with Down's syndrome, ages one month to six years, both hospital and home samples.
Methods: Use of Gesell Developmental Schedules noting landmarks of development; identifying history such as age of parents, genealogy data, etc.; investigation of chromosomal analysis; dermatoglyphic studies; and medical resumé from local doctor.
Duration: February 1965-April 1968.
Investigator(s): Jack B. Share, Ph.D. Candidate, Senior Lecturer, Department of Education, Victoria University, Wellington, New Zealand.
Cooperating group(s): Mental Health Division, Head Office, Wellington, New Zealand.
Publications: Preliminary findings to be presented at pediatric conference; article to be submitted to American Journal of Mental Deficiency.

22-HH-1 IMPROVEMENT OF LANGUAGE SKILLS IN RETARDED CHILDREN

Purpose: To provide sensory and motor experiences which will stimulate language development in non-verbal retarded institutionalized children of nursery age; to provide sensory, motor, perceptual and language experiences which will develop language skills in young, low-verbal, mentally retarded institutionalized children; to provide language stimulation and speech correction for school age and adult mentally retarded institutionalized women.

Subjects: Selected residents at a state institution for the retarded: 119 children, ages 2-6 to 30-10; experimental program with matched controls for 9 children, ages 2-6 to 6-0, in the nursery.
Methods: Structured experiences providing sensory and motor stimulation are accompanied by appropriate verbal label to stimulate language understanding and usage. In the school, language stimulation and speech therapy classes are provided by three speech pathologists. In the nursery and full care cottage for young children, classes are given by speech aides, supervised by a speech pathologist. The speech aides are non-professional high school graduates trained on the job by the speech pathologist.
Findings: Tests with nursery experimental group demonstrate growth in I.Q., Social Age and Social Quotient, and language understanding and usage of the experimental group over the matched controls. Growth in language understanding and usage is measured yearly by a battery of tests, including Illinois Test of Psycholinguistic Abilities, Templin-Darley Test for Articulation, and Peabody Picture Vocabulary test.
Duration: June 1964-1970.
Investigator(s): Eva Hubschman, M.A., Project Director, North Jersey Training School, P.O. Box 215, Totowa, N. J. 07511.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Submitted to Journal of Mental Deficiency and Journal of Speech and Hearing Disorders, Fall 1967; reports delivered at Meetings of Speech Association of the Eastern States, American Association on Mental Deficiency, American Speech and Hearing Association, November 1967.

22-HH-2 EXPERIMENT IN TEACHING RETARDED BLIND CHILDREN

Purpose: To discover ways, means, and methods of helping severely retarded blind children to be independent in activities of daily living, in manipulating materials, and in exploring environment.
Subjects: 43 retarded blind children at Pacific State Hospital.
Methods: College students with majors in sociology, psychology, or education were recruited to work, each with one child, at development of whatever abilities the child had, and to investigate areas to which he could be introduced.
Findings: The one-to-one relationship for only a few hours weekly lead to notable advancement toward independence in children who are so retarded that intelligence cannot be measured.
Duration: Summer 1966-August 1967.
Investigator(s): Irene Blanchard, Ph.D., Research Speech Correction Teacher, Don Bowling, M.A., Principal, and R. Lincoln Roberts, M.A., Vice Principal, Educational Services, Pacific State Hospital, Box 100, Pomona, Calif. 91766.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Mental Retardation; Outlook for the Blind; others pending.

22-HH-3 CREATING THERAPEUTIC PYRAMIDS USING MENTALLY RETARDED PATIENTS

Purpose: To develop procedures whereby institutionalized adolescent retardates acting as tutors can be taught to use modeling and reinforcement techniques to modify the verbal and non-verbal behaviors of younger retardates (trainees).

Subjects: Trainees are non-speaking institutionalized retardates under 10 years of age; tutors are institutionalized teenage or young adult retardates who are ambulatory and able to speak intelligibly.
Methods: An attempt is made to create a therapeutic pyramid in which each of a few mental health professionals trains several retarded tutors who in turn then work with the retarded trainees, thus broadening the base of the pyramid and facilitating a more efficient use of professional time than is usually possible in institutional settings. Modeling is utilized to elicit the desired behaviors; reinforcement strengthens and maintains these responses. A modeling-reinforcement paradigm is employed on two levels: staff uses demonstration and reward to teach the tutors how to work with their trainees; tutors then use this same method to teach their trainees basic verbal and non-verbal skills. Results are evaluated through frequency and duration measures of several types of tutor and trainee behaviors such as tantrums, correct responding, etc., obtained from ongoing training sessions, objective tests of imitative behavior and language comprehension, and ward personnel ratings of social behaviors obtained before and after the training program.
Findings: Preliminary results indicate that retarded tutors can be taught to effectively apply modeling-reinforcement procedures to modify the behavior of younger retardates and that there are many beneficial side effects of this program for both tutors and trainees.
Duration: October 1967-September 1969.
Investigator(s): Carol Kupers Whalen, Ph.D., Research Specialist, Fairview State Hospital, Costa Mesa 92626; and Barbara A. Henker, Ph.D., Assistant Professor, University of California, Los Angeles, Calif.
Cooperating group(s): Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Publication planned, 1968.

Gifted

22-IA-1 "SOFT SIGNS" AND SCHOLASTIC SUCCESS: A NEUROLOGICAL STUDY OF GIFTED CHILDREN

Purpose: To ascertain the frequency of minimal neurological abnormalities in a group of children with superior intelligence.
Subjects: 49 children with I.Q.'s ranging from 130 to 161 in Educationally Advanced classes of the Salem Public School System; control group of 30 children with normal intelligence.
Methods: Complete neurological examinations, EEG's, and special tests for fine motor coordination were performed on all subjects.
Findings: A small number of both groups had minimal neurological abnormalities such as choreiform movements, slight clumsiness, minor eye muscle deviations, etc.
Duration: April-June 1967.
Investigator(s): Peggy J. Copple, M.D., Assistant Clinical Professor of Pediatrics, University of Oregon Medical School, Portland, Ore. 97201.
Cooperating group(s): Department of Psychology, Willamette University, Salem, Ore.
Publications: Material in preparation for publication in neurological and educational journals; paper read at Academy of Pediatrics Postgraduate Course on Learning Disorders, August 1967, Portland, Ore.

Emotionally Disturbed and Mentally Ill

22-JA-1 PREVALANCE OF EMOTIONAL DISTURBANCE AS THE PRIMARY DISABILITY IN CLASSES FOR THE MENTALLY RETARDED

Purpose: To establish an estimate of the number of children presently in classes for the mentally retarded who have some form of emotional disturbance rather than mental retardation as their primary disability.
Subjects: A random, stratified sample of classes for the mentally retarded in 26 Florida counties.
Methods: Survey of teachers.
Findings: Approximately 20 percent of the children in classes for the mentally retarded have emotional disturbance as their primary disability. This percentage varies depending upon whether or not the county provides public school facilities for the emotionally disturbed.
Duration: January-November 1967.
Investigator(s): Myron A. Cunningham, Ed.D., Professor, Marnell L. Pierce, M.Ed., Instructor, and John F. Jacobs, M.Ed., Doctoral Fellow, College of Education, University of Florida, Gainesville, Fla. 32601.
Cooperating group(s): Florida Educational Research and Development Council.
Publications: To be published as a monograph by Florida Educational Research and Development Council, 1968.

22-JA-2 DETECTING NEUROTIC FORERUNNERS IN ELEMENTARY SCHOOL CHILDREN BY MEANS OF CATTELL'S ESPQ AND CPQ SCALES: A PILOT STUDY

Purpose: To determine prevalent problem areas among elementary school children for purposes of programming appropriate educational and mental health services.
Subjects: All the children in grades 1 to 8, inclusive, of an integrated public school.
Methods: Children were screened by means of Cattell's Early School Personality Questionnaire (ESPQ, 1966) and the Children's Personality Questionnaire (CPQ, 1963). Analysis of variance was applied to the test data consisting of 17 personality variables, and intercorrelations between first order and second order variables were also obtained.
Findings: Statistically significant differences were found between boys and girls on several of the personality variables. Intercorrelations showed the greatest positive r between the variables of neuroticism and anxiety.
Duration: October 1966-May 1967.
Investigator(s): Rhea R. Hilkevitch, Ph.D., Director of Research and Evaluation, and Charles Shooster, M.A., Staff Psychologist, John Madden Zone Center, State Department of Mental Health, Roosevelt Rd. and First Ave., Hines, Ill. 60141.
Cooperating group(s): Statistical Evaluation Section, State Department of Mental Health.
Publications: Publication planned; paper presented at Midwestern Psychological Association Meeting, 1967.

22-JA-3 ASSESSMENT OF PATHOLOGY IN CHILDHOOD: PROBLEMS OF DIFFERENTIAL DIAGNOSIS

Purpose: To assess pathology in childhood and the problems of differential diagnosis. (See *Research Relating to Children*, Bulletin No. 16-J-3.)
Subjects: Children with developmental disturbances, sleep disturbances, obsessional neurosis, phobias.
Methods: Clinical and theoretical material is elicited using the "Developmental Profile" as the diagnostic tool. Material is obtained from cases examined diagnostically, from cases in psychoanalytic treatment, from Indexed Cases (in files) with discussion and organization of data in several study groups. Infantile and Adult Neuroses are compared.
Duration: October 1965-September 1967.
Investigator(s): Anna Freud, LL.D., Director; Liselotte Frankl, M.D., Psychiatrist-in-Charge; and Humberto Nagera, M.D., Psychiatrist and Project Coordinator, Hampstead Child Therapy Clinic, 12 & 21 Maresfield Gardens, London N.W. 3, England.
Publications: Monograph submitted for publication; in *The Psychoanalytic Study of the Child* 21, 1966; Monograph No. 2 of *The Psychoanalytic Study of the Child*, 1966.

22-JB-1 SYMPTOM CHANGE DURING INTAKE STUDY

Purpose: To study the effect of symptom change on personality development and to learn which cases are suitable for short-term therapy; to try to determine whether modification of symptoms represents a fundamental change in character development or whether it will be replaced by other symptoms; and to identify the factors influencing the change.
Subjects: All new admissions under age five, seeking service at the Child Development Center.
Methods: Cases which show modification are catalogued to see whether certain symptoms are more likely to show change than others, i.e., bowel retention, sleep disturbance, enuresis, hairpulling, etc. Each case is evaluated according to specific data which include description of symptom, age at onset, duration, treatment, if any, prior to study, suggestions made by worker during study, changes made spontaneously by parent or teacher, subsequent course and appearance of new symptoms, reaction of family members to symptom, parents' view of what influenced change, their response to change, and whether change stablized. Each case is reviewed intensively in an attempt to arrive at a dynamic formulation. A controlled situation is set up between worker and child to see whether the same situation can be replicated with revival of symptoms, or whether integration has been established.
Duration: October 1966-continuing.
Investigator(s): Nina R. Lief, M.D., Psychiatrist, Child Development Center, 120 W. 57th St., New York, N. Y. 10019.

22-JB-2 CHILDHOOD EMOTIONAL DISORDERS AND THE NON-RESTING EEG

Purpose: To investigate the feasibility of recording electroencephalograms from children with emotional disorders while they are at play; specifically, to determine whether the non-resting electroencephalogram is useful in differentiating children with different types of emotional disorders.
Subjects: Children with aggressive or neurotic emotional disorders.
Methods: Electroencephalograms are recorded via telemetry with consideration of three aspects: (1) period of the dominant rhythm from

central, parietal, and occipital regions, (2) complexity of the waves recorded from these areas, and (3) frequency distribution of the periods of individual waves in selected intervals. If procedure is feasible, the EEG's of children with aggressive emotional disorders will be compared with those of children with neurotic emotional disorders to determine whether the non-resting electroencephalogram is useful in differentiating the two groups.
Duration: 1966-1968.
Investigator(s): Walter W. Surwillo, Ph.D., Associate Professor of Clinical Psychology, and Reginald Quilter, Bio-Medical Technologist, Child Psychiatry Research Center, University of Louisville School of Medicine, Louisville, Ky. 40202.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

22-JB-3 THE USE OF PERCEPTUAL-MOTOR-BODY TRAINING WITH SEVERELY DISTURBED INSTITUTIONALIZED CHILDREN

Purpose: To gain information as to whether or not: (1) children with emotional and/or learning difficulties sufficient to require institutionalization are prone to have poor body concepts (perceptual-motor difficulties); (2) brief body image training, geared to general perceptual-motor difficulties as outlined by Newell Kephart, will increase the functional level of these children's abilities as a group in the areas of basic perceptual-motor skills, psychosocial adjustment, and academic acuity.
Subjects: 16 inpatient residents at the William Healy School, ages 8 to 12, who are enrolled in the Special Education Service Program.
Methods: Administration of a test battery including the Purdue Perceptual-Motor Survey, California Achievement Test Battery, Developmental Form Sequence, Standard Figure Drawing, and two sub-tests of the Illinois Test of Psycholinguistics to all subjects; division of subjects into two matched groups on the basis of age, sex, I.Q., and ranking on the perceptual-motor survey and academic achievement tests; daily paced individual training sessions utilizing Kephart's training program for one group for a period of twelve weeks, with the other group serving as control; re-administration of the pre-training test battery to all subjects.
Findings: Pre-test findings indicated that the group of 16 subjects as a whole tended to be very poor in perceptual-motor-body ability as was speculated in the original hypothesis.
Duration: November 1966-September 1967.
Investigator(s): Ned Gaylin, Ph.D., Supervising Psychologist III, and Katherine Wimmer, M.Ed., Director, Special Education Service, Institute for Juvenile Research, 907 S. Wolcott St., Chicago, Ill. 60612.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

22-JB-4 THREE EARLY READERS; A CASE STUDY OF THREE CHILDREN WHO COULD READ AT A VERY EARLY AGE

Purpose: To investigate the cases of three very disturbed children who were able to read at age two in order to discover similarities and differences in them and their backgrounds and find factors which may have caused their abnormal development.
Methods: Case study method utilizing psychiatric evaluation, psychological testing, social work intake material, and available history.

Duration: March 1967-January 1968.
Investigator(s): Leon Tec, M.D., Medical Director, and Richard M. Starr, Jr., M.Ed., Clinical Psychologist, Mid-Fairfield Child Guidance Center, Inc., 74 Newton Ave., Norwalk, Conn. 06851.

22-JB-5 CHILD-REARING ATTITUDES OF MOTHERS OF EMOTIONALLY DISTURBED CHILDREN

Purpose: To explore some factors that may be important in the etiology, diagnosis, and treatment of emotional disturbance in children attending public elementary schools; specifically, to investigate maternal attitudes and their relationships to the child.
Subjects: Experimental group of 90 mothers of children identified as emotionally disturbed by the school social workers and psychologists through the use of social histories, psychological tests, and interviews with children and their parents. Children were between ages 6 and 12 and awaiting placement in special classes for the emotionally disturbed; their mothers had not been advised of their pathology. Control group was composed of mothers of children not diagnosed as disturbed and living in the same geographical area as the experimental group.
Methods: Parental Attitude Research Instrument was administered to both groups, along with a brief bibliographical questionnaire. Differences between groups were measured by t test.
Findings: Significant differences were found between the two groups in that the experimental group felt their husbands were much more inconsiderate of their feelings; significant differences were also found in family size and incidence of emotional disturbance; differences were also evident in communication levels and the sex of the disturbed child.
Duration: January-June 1967.
Investigator(s): Anthony J. LaPray, Ed.D., Assistant Professor of Educational Psychology, Brigham Young University, Provo, Utah 84601.
Publications: Publication in preparation, 1968.

22-JB-6 SYMPTOM CHECKLIST FACTOR STUDY

Purpose: To compare the symptom picture obtained on child guidance patients by three methods: (1) Wichita Symptom Checklist, (2) Peterson Symptom Checklist, and (3) Institute for Juvenile Research Symptom Checklist; to compare the factors so obtained with those obtained in previous investigations using school children and clinic patients.
Subjects: 63 boys and 36 girls, ages 10 to 13, who were patients at the Institute for Juvenile Research.
Methods: The three checklists were separately factor analyzed; a canonical analysis will be performed.
Findings: From the three symptom checklists, four factors each were found for the Peterson and Wichita Checklists and three factors for the IJR Checklist. Two of the four factors found on the Peterson appear to be similar to personality and conduct factors identified in previous research. The analysis of the data involves comparison of the factors obtained from the three checklists.
Duration: August 1966-May 1968.
Investigator(s): Elise E. Lessing, Ph.D., Senior Research Associate, Institute for Juvenile Research, 232 E. Ohio St., Chicago, Ill. 60611.
Publications: To be published in a professional journal.

22-JC-1 SELF-INFLICTED INJURIES IN THE PRE-ADOLESCENT CHILD: A STUDY OF PARENT ATTITUDES

Purpose: To study (1) the concept of death in the pre-adolescent child and the factors which contribute to self-inflicted injuries; and (2) the factors within the home environment, such as parent attitudes and feelings towards child rearing, in order to understand those factors which might be regarded as predictive clues to future self-inflicted injury.
Subjects: Pre-adolescent children referred through suicide prevention centers and medical and psychiatric facilities; a control group of normal families.
Methods: Statistical analysis is made of a number of attitude rating scales obtained from experimental and control families. Analysis of variance and factor analysis will be done to help in determining those variables which might be regarded as predictive clues. In addition, each child is given a complete battery of psychological tests in order to identify those intra-psychic characteristics which make a child behave in a self-destructive manner.
Duration: July 1966-1970.
Investigator(s): Morris J. Paulson, Ph.D., Assistant Professor of Medical Psychology, University of California Medical Center, Los Angeles, Calif. 90024.

22-JD-1 INDUCED RESPIRATORY CHANGE IN ASTHMATIC CHILDREN

Purpose: To pursue preliminary findings that, after viewing a motion picture of another child having asthma, asthmatic children report increased respiratory distress.
Subjects: Approximately 35 asthmatic children.
Methods: Will obtain subjective and objective measures of respiratory and autonomic responses to the experimental film alone and to the film in combination with a bronchial challenge. Purpose of the latter is to test a "summation of stimuli" hypothesis.
Findings: Pilot results show subjective increases in respiratory distress and, in one instance thus far, evidence of increased severity of wheezing.
Duration: June 1967-May 1969.
Investigator(s): Jonathan H. Weiss, Ph.D., Chief, Clinical Psychology, Children's Asthma Research Institute and Hospital, Denver, Colo. 80204.
Cooperating group(s): National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

22-JD-2 INTERDISCIPLINARY STUDY OF ADOLESCENT ENURESIS

Purpose: To clarify and define the various components of adolescent enuresis; to define causative factors as far as this is possible.
Subjects: Nocturnal enuretics, ages 12 to 18, referred to Adolescent Clinic with enuresis as primary or secondary complaint; two control groups of 25 non-enuretic clinic patients and 25 non-enuretic adolescents from the surrounding community, matched for age and sex.
Methods: Medical, social psychological, and psychiatric data were collected on all subjects. Data were analyzed through cross-correlation between findings of the different disciplines and the three groups of subjects.
Duration: September 1965-December 1967.

Investigator(s): Solbritt E. S. Murphy, M.D., Pediatrician and Clinical Instructor; Jackson D. Nickols, M.S., Psychologist and Instructor in Pediatrics and Psychiatry; Agnes E. Umphress, M.S.W., Clinical Social Worker; and Sherrel L. Hammar, M.D., Director, Adolescent Clinic, Division of Child Health, University of Washington, Seattle, Wash. 98105. (Reported by Margaret A. Ohlson, Ph.D., Research Coordinator, Division of Child Health.)
Cooperating group(s): Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.
Publications: Paper presented at Annual Meeting of American Academy of Pediatrics, October 22, 1967, Washington, D. C.; plan to publish in pediatric, sociological, and psychological journals.

22-JE-1 THE ACQUISITION OF IMITATIVE RESPONSES AND EVIDENCE FOR NEGATIVISM IN AUTISTIC CHILDREN

Purpose: To investigate the responses of the autistic child occurring during the acquisition stage of learning which impede the performance of the reinforced response.
Subjects: Three autistic latency age males on inpatient service who do not use social-verbal communication.
Methods: Each child receives 12 45-minute sessions a week during meal times. Responses by the child that match the immediately preceding ones of the model are reinforced by the model with food. Records are kept of those responses that occur frequently. These responses include some of the reinforced imitative responses but also include a large proportion of non-reinforced responses that seem to interfere with the occurrence of the imitative responses. These interfering responses are investigated.
Findings: Interfering responses often include responses that are a "compromise" response relative to the one reinforced. The reinforced response will often occur at a better-than-chance frequency on one occasion only to be replaced by an interfering response on the next occasion. Autistic children may have correct responses in their response repertory which they will not emit under certain conditions but will under other conditions.
Duration: July 1966-September 1968.
Investigator(s): Delmont Morrison, Ph.D., Assistant Clinical Professor of Medical Psychology; Dale Miller, M.A., Educational Psychologist; and Berta Mejia, B.S., Staff Nurse, Department of Psychiatry, University of California Medical School, San Francisco, Calif.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Paper submitted to American Journal of Orthopsychiatry; others to be submitted to appropriate journals.

22-JG-1 A HOME TRAINING PROGRAM FOR MENTALLY ILL CHILDREN

Purpose: To evaluate a highly individualized Home Training and Guidance Program designed to prepare mentally ill children, considered "uneducable", for group living within the family and community.
Subjects: 24 mentally ill children, ages three to seven, currently on waiting list of League School for Seriously Disturbed Children, and their parents; control group of 24.
Methods: Program is based on early diagnosis, psycho-educational assessment, and the relevant interdisciplinary recommendations that

accompany the assessment. Child and mother attend individual one-hour training sessions. Teacher uses specific remedial, habilitative, therapeutic, and educational techniques and activities that may reduce, correct, or remove the child's disabilities, or work around and compensate for irremedial disabilities if possible. Mother observes teacher attitudes, techniques, relationships, and interactions with child, has additional conferences with teacher, and participates in parent-group counseling sessions with the social worker. This should give parents greater understanding of the child and assurance and competence in handling him, thus helping the child to grow.
Duration: Not reported.
Investigator(s): Carl Fenichel, Ed.D., Program Director, and Bernice Bukatman, M.S., Co-director, League School for Seriously Disturbed Children, 196 New York Ave., Brooklyn, N. Y. 11216.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

22-JG-2 SHORT-TERM FAMILY THERAPY WITH FAMILIES OF SCHOOL UNDERACHIEVERS

Purpose: To evaluate the effect of 12-session conjoint family therapy on school achievement; to evaluate the therapist's ability to use two contrasting types of family therapy.
Subjects: Eighth grade boys, designated as scholastic underachievers.
Methods: Therapist uses two types of treatment, one which defines the study of family transactions within the session as the object of the study, and one which attempts to have the family set up experiments to be tried between sessions. Evaluation of change over course of therapy will be based on review of grades before and after study, and changes noted by teachers during this period. Changes in family modes of interacting will be studied by repeating family interactional tasks after therapy.
Duration: 1966-1973.
Investigator(s): Helm P. Stierlin, M.D., Ph.D., Adult Psychiatry Branch, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Chevy Chase, Md. 20203.

22-JG-3 MULTIFAMILY GROUP THERAPY

Purpose: To explore the therapeutic effect of placing problem families together in what is essentially an encapsulated societal milieu. This is done to expose isolated families to the corrective influence of what occurs in other families so that their rigid and distorted ideas of familial functioning and societal organization can be brought out and worked up; to set up criteria for inclusion in multifamily groups.
Subjects: Families from the area serviced by the Child Guidance Clinic of the Oranges, Maplewood, and Millburn.
Methods: Three families, each consisting of the mother, father, and designated child patient, are seen in a group setting on a weekly basis by a male and a female co-therapist. Siblings are introduced into the group when it is deemed appropriate. Families are seen for one year minimally and longer if necessary. All groups are seen by the same therapists to elimate therapist effect and are subject to the same treatment procedures. All group sessions are taped.
Findings: Families with the same defensive structures tend to reinforce each other in their pathology, and resistance in the groups is increased.

Verbal capacity and symptoms, *per se*, are not significant. Age of child patient seems to be an important factor as older children respond better to the group setting.
Duration: September 1964-June 1969.
Investigator(s): Marion B. Powell, Ph.D., Chief Psychologist, and John P. Monahan, M.S.W., Clinic Administrator, Child Guidance Clinic of the Oranges, Maplewood, and Millburn, 115 S. Munn Ave., East Orange, N. J. 07018.
Publications: Paper presented at American Orthopsychiatric Association Meeting, San Francisco, Calif., April 1966.

22-JG-4 GROUP THERAPY WITH PARENTS WHOSE CHILDREN ARE PARTICIPATING IN A DAY CENTER FOR EMOTIONALLY DISTURBED CHILDREN

Purpose: To test the hypotheses that therapeutic help to emotionally disturbed latency age children living at home can be significant only if parents are aided to substantial attitudinal growth, and that provision of group therapy for parents during the time their children are receiving relevant treatment and education can effect parental attitude change.
Subjects: Eight families in which diagnosis precluded extremes in psychotic or character disorder of child or parent, prognosis was that child could return to public school within a two-year period, and the parents would and could use group psychotherapy. Some of the children were delinquent.
Methods: Each parent is evaluated by caseworker, psychiatrist, and psychologist as a basis for consideration. Group psychotherapy offered to both parents as a contingent to child's participation in the academic program. Commitment is for two years, with each parent meeting weekly with a mixed group of non-spouses.
Duration: 1965-1967.
Investigator(s): George E. Gaby, M.S.W., Caseworker, Children's Study Home, 38 Sherman St., Springfield, Mass. 01109. (Reported by NCCD. See Note, p. 51.)
Cooperating group(s): Massachusetts State Department of Welfare.

22-JH-1 TECHNICAL PROBLEMS IN CHILD PSYCHOANALYSIS

Purpose: To investigate and clarify analytic therapy problems, and methods of handling them.
Subjects: Patients of 12 therapists in private practice.
Methods: Presentation and discussion of clinical data with records and follow-up of future developments.
Duration: May 1966-continuing.
Investigator(s): Nathan N. Root, M.D., American Association of Child Psychoanalysis, 201 E. 66th St., New York, N. Y. 10021.
Publications: Presentation of data at scientific meeting of American Association of Child Psychoanalysis.

22-JH-2 IMPULSE CONTROL; NURSERY SCHOOL EDUCATION AND DEVELOPMENT

Purpose: This research represents part of a larger research program designed to study modifications in current educational and therapeutic practices which may be generalized to the larger group of culturally disadvantaged children.

BEST COPY AVAILABLE

Subjects: Children from the Nursery School at the Child Study Center and other nursery schools within the community.
Methods: Individual, therapeutic, and clinical assessment, and quasi-experimental techniques are used to evaluate existing status and change over a period of time in response to various intervention techniques. Wherever possible, experimentally designed situations are introduced to help gather data.
Duration: September 1966-continuing.
Investigator(s): Seymour L. Lustman, M.D., Ph.D., Professor of Psychiatry, Child Study Center, and Department of Psychiatry, Yale University, New Haven, Conn. 06510.
Publications: In *Psychoanalysis--A General Psychology*, M. Schur, L. Newman, and A. J. Solnit (Eds.). New York: International Universities Press, 1966.

22-JH-3 PILOT PROGRAM WITH SERIOUSLY EMOTIONALLY DISTURBED DEAF CHILDREN, PHASE I

Purpose: To determine (1) the best teaching techniques to use to bring about behavioral change in seriously emotionally disturbed deaf children that will result in their being able to live harmoniously with others and learn in a small group situation; (2) the appropriate program, activities, and living arrangements for the children to bring about the changes stated above; and (3) what effect parental education and counseling have in bringing about changes in the behavior of these children.
Subjects: 16 seriously emotionally disturbed deaf boys, ages 7 to 11.
Methods: Use of operant conditioning procedures in both the educational program and residential living program; parent counseling, conferences, instruction of parents in manual communication, and group therapy sessions with a trained psychological counselor.
Findings: Three of the 16 boys were successfully returned to a program for normal deaf children after a period of one year.
Duration: October 1966-June 1968.
Investigator(s): Richard G. Brill, Ed.D., Superintendent, and Robert K. Lennan, M.A., Project Supervisor, California School for the Deaf, 3044 Horace St., Riverside, Calif. 92506.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Final report to be made available through Educational Resources Information Center, U. S. Office of Education.

22-JH-4 RECIPROCAL INHIBITION THERAPY WITH NEUROTIC CHILDREN

Purpose: To test the feasibility of applying Wolpe's Reciprocal Inhibition Therapy to a large group of children with phobic disorders.
Subjects: 144 children diagnosed as phobic by a clinical team.
Methods: Children are assigned at random to a program of Reciprocal Inhibition Therapy (RIT), traditional play therapy (PT), or no therapy. Two therapists conduct both types of treatment. Patients receiving both RIT and PT will have a maximum of 24 therapy sessions lasting one hour and spaced one week apart. Six weeks after termination of treatment, a follow-up evaluation will be done, comparing the three groups. Patients receiving no therapy will be re-assessed after 32 weeks. Difference scores between first and second assessment will be analyzed in a factorial design.

Duration: June 1967-May 1970.
Investigator(s): Lovick C. Miller, Ph.D., Director of Research, Child Psychiatry Research Center, University of Louisville School of Medicine, Louisville, Ky. 40202.
Cooperating group(s): National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: To be submitted for publication.

22-JH-5 THE TREATMENT OF AUTISTIC-LIKE CHILDREN THROUGH OPERANT CONDITIONING IN AN OUTPATIENT CLINIC

Purpose: To determine the feasibility of treating autistic-like children through operant conditioning on an outpatient basis; to develop methods which will help to accurately select parents who can be successful in helping to "treat" their own child; to encourage local, state, and federal agencies to take more responsibility in attempts to help these children.
Subjects: Children, ages four to eight, who exhibit bizarre behavior, have failed to develop normal social relationships, are often out of contact with reality, and demonstrate bizarre speech or have no speech at all; their parents.
Methods: Parents and children are chosen after screening by psychologist, speech pathologist, and psychiatrist, with selection based mainly on observable behavior, interaction, and results of testing with several standardized scales. Each child is seen individually for one hour daily at the clinic for about three months. Operant conditioning and methods similar to those developed by Lovaas are used to teach speech and "socialization". Emphasis is on speech, and food is used as the reinforcer. Parents are taught to carry on the same program at home. After child begins to respond to social reinforcers (good boy!), he is placed in a nursery school with other children in the same program; there is also some interaction with normal children.
Findings: It is feasible to treat autistic-like children through operant conditioning on an outpatient basis. Treatment is economical because lay people can be trained as therapists in the short period of two months.
Duration: February 1967-continuing.
Investigator(s): Michael Goldblatt, Ph.D., Staff Clinical Psychologist, and William Trachtenberg, M.A., Director of Speech Pathology, St. Christopher's Hospital for Children, Philadelphia, Pa. 19133.
Cooperating group(s): Philadelphia Board of Education.
Publications: Early findings to be submitted for publication to American Journal of Orthopsychiatry, Journal of Consulting Psychology, or Behavior Research and Therapy.

22-JH-6 THE EFFECTS OF ECT ON VISUO-MOTOR AND PERCEPTUAL FUNCTIONING IN CHILDHOOD SCHIZOPHRENIA

Purpose: To evaluate immediate and long-term effects of electric shock therapy on test performance of schizophrenic children.
Subjects: 20 children in residential treatment at Children's Unit, Creedmoor State Hospital.
Methods: A battery of tests, including the Bender-Gestalt, Picture Completion, Picture Arrangement, Block Design, Benton Visual Retention, Object Emergence, and hidden figures was administered immediately before ECT, immediately after completion of the series, and one month later.

Findings: A general improvement was observed in Bender-Gestalt performances. About half of the sample demonstrated improved pattern of performance on perceptual tests.
Duration: 1966-1967.
Investigator(s): Leonard Cobrinik, Ph.D., Senior Research Psychologist, Children's Unit, Creedmoor State Hospital, Queens Village, N. Y. 11427.
Publications: Submitted for publication.

Socially Deviant

Note: Some of the following delinquency studies, as well as a few in other categories, were taken from the section "Current Projects," in Crime and Delinquency Abstracts, Vol. 4, Nos. 3 and 5, 1966 (formerly entitled International Bibliography on Crime and Delinquency). This publication is prepared by the National Clearinghouse for Mental Health Information of the National Institute of Mental Health (5454 Wisconsin Ave., Chevy Chase, Md. 20203) from material provided by the National Council on Crime and Delinquency (44 E. 23rd St., New York, N. Y. 10010). The studies are noted: (Reported by NCCD.)

22-KA-1 PREGNANCY IN SCHOOL CHILDREN IN THE LIGHT OF CHILD-PERCEIVED MOTHER-CHILD RELATIONSHIPS

Purpose: To determine whether the mother-child relationship, as perceived by the daughter, is a factor in determining the incidence of pregnancy in 13- to 15-year-old girls.
Subjects: 5,000 girls in six selected junior high schools with follow-up of those who become pregnant during a one-year observation period; control sample of 50 matched and 100 randomly chosen girls from original sample of 5,000.
Methods: In prospective phase of study, Schaeffer's Child-Reported Parental Inventory to measure certain factors in the mother-daughter relationship and investigator's questionnaire on the concept of trust are administered. In retrospective phase, estimated 50 girls who became pregnant are interviewed to further investigate the relationship to the mother and to determine patterns of and attitudes toward sexual activity.
Duration: June 1966-Fall 1967.
Investigator(s): Beverly H. Bowns, D.P.H. Candidate, Department of Mental Hygiene, Johns Hopkins University School of Hygiene and Public Health, Baltimore, Md. 21205.
Cooperating group(s): Baltimore City Board of Education.
Publications: Publication planned.

22-KC-1 A STUDY OF JUVENILE DELINQUENTS IN DAR ES SALAAM, TANZANIA

Subjects: 100 juvenile offenders in approved schools and prisons; a control group of non-offenders, primarily school children.
Methods: Comparison of two groups on factors such as family background, incidence of broken homes, and peer group and school influences.
Duration: March 1966-1967.
Investigator(s): Carl G. Widstrand, University College, Dar es Salaam, Tanzania. (Reported by NCCD.)

22-KC-2 ATTITUDINAL BARRIERS TO DELINQUENCY CONTROL

Purpose: To learn how the general public views delinquency control and how attitudes differ among various groups.
Subjects: Representative sample of adult population in Wisconsin.
Methods: Sample given standardized interviews; analysis of significant differences used to determine how various strata view problem of delinquency control.
Findings: General public is apparently interested in punishment of delinquents but, at the same time, is interested in having highly qualified experts handle these problems. Ambivalence and confusion are evident. Attitudes vary according to social status: individuals of higher social status are found to be less punitive and show less confusion as to how delinquents should be treated. Analysis of data continuing.
Duration: October 1964-June 1967.
Investigator(s): William P. Lentz, Ph.D., Chief, Planning and Development; Paul H. Kusuda, M.A., Social Science Research Analyst; and James Lewis, Ph.D., Division for Children and Youth, State Department of Welfare, State Office Building, Madison, Wis. 53702. (Reported by NCCD.)
Publications: Journal of Research in Crime and Delinquency, January 1967.

22-KC-3 JUVENILE DELINQUENCY IN THE UNION OF SOVIET SOCIALIST REPUBLICS

Purpose: To survey the problem of juvenile delinquency in the Union of Soviet Socialist Republics.
Methods: Survey will include a study of juvenile delinquent types, incidence, distribution, frequency, and trends of occurrence.
Duration: Not reported.
Investigator(s): H. Kent Geiger, Ph.D., Professor of Sociology, University of Wisconsin, Madison, Wis. 53706. (Reported by NCCD.)
Cooperating group(s): Ford Foundation.

22-KD-1 JUVENILE NORMS ON THE ROTTER SENTENCE COMPLETION TEST

Purpose: To develop quantitative norms of juvenile delinquents and non-delinquents on the Rotter Sentence Completion test; to illustrate the use of this test in helping to identify and understand the life style of delinquents.
Subjects: 100 boys and 100 girls, all juvenile delinquents from the Essex County Youth House; control group of 100 boys and 100 girls.
Methods: Rotter Sentence Completion test is administered to delinquent and control groups, and results are analyzed.
Duration: April 1967-January 1968.
Investigator(s): Donald N. Lombardi, Ph.D., Associate Professor of Psychology, Seton Hall University, South Orange 07079, and Psychologist, Essex County Youth House, 70 Duryee St., Newark, N. J. 07103.
Publications: Publication planned.

22-KD-2 EARLY DETECTION OF JUVENILE DELINQUENCY

Purpose: To detect potential delinquency in children at an early age in order to intervene to abort its development.

Subjects: Over 100 children, ages two to three, admitted to pre-nursery section of Child Development Center since 1959.
Methods: Long-term follow-up through direct observation of children and parents by caseworkers, nursery school teachers, psychologists, and psychiatrists; recorded interviews; data collection on parent-child relationship, parental relations, and interpersonal relations. Based on above, investigators apply Glueck Social Prediction Table for two- to three-year-olds.
Duration: April 1967-continuing.
Investigator(s): Nina R. Lief, M.D., Psychiatrist, Child Development Center, 120 W. 57th St., New York, N. Y. 10019.
Cooperating group(s): New York City Youth Board.

22-KD-3 PREDICTION OF DELINQUENCY RATES IN CHILDREN OF PARENTS ON PAROLE FROM CORRECTIONAL INSTITUTIONS

Subjects: Six children with abnormal psychopathology referred to the investigator by their parents.
Methods: Children are evaluated clinically, and by means of projective tests and case histories.
Duration: Spring 1967-Spring 1968.
Investigator(s): Hans A. Illing, M.S.W., Ph.D., Staff Member, Hacker Clinic, and Senior Psychiatric Social Worker, Parole Outpatient Clinic, State Department of Corrections, 107 S. Broadway, Los Angeles, Calif. 90012.
Publications: To be submitted for publication.

22-KD-4 RECEPTION CENTER RESEARCH PROJECT

Purpose: To determine extent to which a coordinated diagnostic study and evaluation of offenders at a reception center is a factor in their rehabilitation; to develop criteria for a more effective treatment program.
Subjects: All newly committed male youths, ages 16 to 20 (except the mentally handicapped and those sentenced to death), received at the State Department of Correction Reception Center at Elmira.
Methods: Subjects are diagnostically studied, evaluated, and classified by specialists prior to their transfer to appropriate Department institutions.
Duration: October 1965-1970.
Investigator(s): Herbert L. Bryan, Division of Research, State Department of Correction, Governor Smith State Office Building, Albany, N. Y. 12225. (Reported by NCCD.)

22-KD-5 SCHOOL CAREERS OF JUVENILE DELINQUENTS

Purpose: To determine if there are particular types of school maladjustments which can be used to identify the delinquency-prone child.
Subjects: 12 secondary school classes in a particular region.
Methods: In a longitudinal study, school careers of subjects are being compared with a theoretically normal or "ideal" school career, based on statistics of the French Ministry of Education. Proportion in which certain maladjustments can be identified, number of school dropouts,

and number who were expelled from school will be analyzed in a study of the way in which a child's school career may be made more successful or unsuccessful.
Duration: 1962-1967.
Investigator(s): Henri Michard, Director, Centre de Formation et de Recherche de l'Education Surveillée, 54, Rue de Garches, Vaucresson, S. & O., France. (Reported by NCCD.)
Cooperating group(s): Ministère de la Justice, Service de l'Education Surveillée; Institut Pédagogique National; Délégation Interministérielle à la Recherche Scientifique et Technique; Ministère de l'Education Nationale, France; Department of Education, United Nations Economic and Social Council.

22-KE-1 STUDY OF THE CHARACTERISTICS OF JUVENILE DELINQUENCY

Purpose: To investigate the psychological, bio-medical, and sociological aspects of juvenile delinquency.
Subjects: 500 boys, ages 14 to 18, a representative sample of the juvenile delinquent population of France.
Methods: Pilot study of subjects, conducted from 1958-1961, experimented with methods of collection and analysis of data. Statistical analysis of data by a method called latent structure analysis led to establishment of a typology of juvenile delinquents. Major part of this study is now in progress.
Duration: 1958-1970.
Investigator(s): Henri Michard, Director, Centre de Formation et de Recherche de l'Education Surveillée, 54, Rue de Garches, Vaucresson, S. & O., France. (Reported by NCCD.)
Cooperating group(s): Ministère de la Justice, Service de l'Education Surveillée; Délégation Interministérielle à la Recherche Scientifique et Technique; Centre National de la Recherche Scientifique, France.

22-KJ-1 PARENTAL DISCIPLINE AND DELINQUENCY

Purpose: To determine the relationship between parental discipline and delinquency in adolescent males.
Subjects: 80 mothers and fathers of urban and rural delinquent and normal boys, ages 11 to 16.
Methods: Interviews with parents.
Duration: June 1966-March 1967.
Investigator(s): F. R. Wake, Ph.D., Associate Professor of Psychology, Carleton University, Ottawa, Ontario, Canada. (Reported by NCCD.)

22-KJ-2 ECONOMIC DEVELOPMENT AND JUVENILE DELINQUENCY

Purpose: To study the effects of industrialization and urbanization on the social relations within primary groups.
Methods: Comparative international research, using juvenile delinquency as a criterion of disorganization. A statistical study of offenses and their possible variations in each locality; a comparative case study of samples of delinquents from localities whose residents had a high incidence of geographic, social, and professional mobility, and samples of delinquents from localities with a low incidence.

Duration: 1964-1969.
Investigator(s): Henri Michard, Director; M. Peyre; and M. Selosse, Centre de Formation et de Recherche de l'Education Surveillée, 54, Rue de Garches, Vaucresson, S. & O., France. (Reported by NCCD.)
Cooperating group(s): Centre Européen de Coordination de Recherches et de Documentation en Sciences Sociales, Vienna, Austria; Ministère de la Justice, Centre d'Etudes Pénitentiaires, Warsaw, Poland; Institut des Sciences Juridiques et Politiques de l'Académie des Sciences, Hungary; Institut de Criminologie, Belgrade, Jugoslavia; Ministère de la Justice, Service de l'Education Surveillée; Délégation Interministèrielle a la Recherche Scientifique et Technique, France.

22-KJ-3 DIFFERENTIAL PATTERNS IN RURAL-URBAN DELINQUENCY

Purpose: To compare rural and urban patterns of delinquent behavior to see whether different family patterns are reflected.
Subjects: 20 institutionalized delinquents: 10 from urban and 10 from rural areas; comparison group of 10 urban and 10 rural non-delinquent high school students.
Methods: Subjects were tested on the Glueck scale of family solidarity and control and delinquency as modified by the New York City Youth Board.
Findings: The rural delinquent reflected greater family disorganization than the urban non-delinquent but less than the urban delinquent, and the urban non-delinquent revealed less family solidarity than the rural non-delinquent, reflecting general weakening of family control of youth in urban areas. In the rural area there appeared to be areas of social control in the community when they were lacking in the family. Delinquent behavior in the rural areas continues to be mostly of the individual type while sub-cultural or peer group delinquent patterns are reflected in the urban group.
Duration: January 1966-1968.
Investigator(s): Edward D. Stokes, M.S., Assistant Professor of Sociology, James Juaire, and Bruce Miller, Bemidji State College, Bemidji, Minn. 56601. (Reported by NCCD.)

22-KK-1 A COOPERATIVE PROGRAM FOR THE ALLEVIATION OF JUVENILE BEHAVIOR PROBLEMS

Purpose: To demonstrate the effectiveness of individualized education and vocational training in conjunction with intensive counseling in the prevention of juvenile delinquency.
Subjects: 180 students in Tulsa County, Oklahoma.
Methods: Services available from public schools, the courts, the Department of Public Welfare, and the Vocational Rehabilitation Agency will be coordinated, and efforts made to stimulate the interest and support of other community and governmental agencies. Continuous project evaluation will be conducted to determine effectiveness of project. Criteria to be used will be any reduction in number of delinquent acts committed by subjects and any increase in efficiency in provision of services to delinquents due to the coordination of efforts and activities by cooperating agencies.
Duration: 1965-1968.
Investigator(s): Glen Wallace, State Department of Education, Oklahoma Capitol Building, Oklahoma City, Okla. 73105. (Reported by NCCD.)
Cooperating group(s): Office of Research and Demonstrations, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.

22-KR-1 THE WORK INCENTIVE PROGRAM FOR JUVENILE COURT WARDS

Purpose: To determine the effectiveness of a Work Incentive Program in abating recidivism among delinquent boys.
Subjects: Male juvenile court wards, ages 15 to 18.
Methods: Forty-five boys per summer reside at Juvenile Hall for periods of 30, 60, or 90 days, while taking part in work-furlough programs. They are transported to work assignments which include farming, working in car wash or service stations, and other labor paying minimum wages. Juvenile Hall provides job counseling and remedial schooling as well as food and lodging. Expenses, restitution, fines, and voluntary allotments are deducted from the boys' earnings.
Findings: Program dropouts were fewer than five percent, and about 30 percent of the boys continued in employment beyond the assigned time period. Juvenile law violations and delinquency abated 23 percent, but misbehavior recidivism was not markedly reduced. About 60 percent were known to be school problems, curfew violators, family dissidents, vandals, and petty law breakers after release. Although the Work Incentive Program is no more effective in abating recidivism than are more traditional treatment methods, temporary respite for the community is gained while these problem youngsters are segregated in such a program. Collateral benefits of work-training, positive work attitudes, maturation, and community appreciation were deemed to be worthwhile.
Duration: 1964-not reported.
Investigator(s): A. H. Giovannetti, Chief Probation Officer, Monterey County, P.O. Box 2135, Salinas, Calif. 93901.

22-KR-2 THE IMPACT OF INSTITUTIONALIZATION UPON DELINQUENT BOYS

Purpose: To measure attitude change associated with incarceration in an institution for "disturbed delinquent boys"; to relate attitude changes, if any, to the boys' behavior after release.
Subjects: 300 white and Negro boys, ages 16 to 18, consecutively released from an institution.
Methods: A questionnaire is administered and ratings obtained from staff at institution; boys are followed after release.
Duration: 1963-1968.
Investigator(s): Thomas G. Eynon, Ph.D., Associate Professor, Department of Sociology, Ohio State University, Columbus, Ohio 43210.
Cooperating group(s): Training Institute of Central Ohio, Columbus.
Publications: Report will be available from Dr. Eynon.

22-KS-1 COMPARISON OF THREE TREATMENT MODELS IN DELINQUENCY

Purpose: To determine (1) whether any one of three special treatment methods (intensive conjoint family therapy, intensive peer-group therapy, or a Negro self-image enhancement indoctrination program) is more effective than any other in changing delinquent attitudes or reducing delinquent and maladjustive behavior in lower socio-economic class delinquent boys; (2) whether any one of the three special treatment methods adds any degree of significant effectiveness to that achieved by a residential group-living program which places special emphasis on apprenticeship and job training and job placement; (3) whether the Youth Development Center at South Philadelphia, with a newly organized program, is more effective with this type of delinquent boy than two of the best facilities and programs now available, and whether it therefore might be a model for future planning in this field for the Commonwealth of Pennsylvania; and (4) the characteristics of the delinquent boys and of their backgrounds which differentiate those who improve in their attitudes and behavior from those who do not.

Subjects: 300 delinquent Negro boys, ages 16 to 19, court-committed to residence at the Youth Development Center, South Philadelphia: 100 in each of two treatment groups and 100 in a non-treatment control group; 60 delinquent boys at a control institution, the Youth Development Center in North Philadelphia, matched with the preceding sample for relevant social background variables; 100 non-delinquent boys at other institutions and schools.

Methods: Treatment and control groups are pre- and post-tested on a comprehensive psychological test battery, including approximately 25 different individually and group administered tests and a structured interview; behavioral adjustment ratings and disciplinary reports are made by institutional counseling staff. Subjects will be followed to determine recidivism rates.

Duration: July 1966-June 1970.

Investigator(s): Alfred S. Friedman, Ph.D., Director of Research, Philadelphia Psychiatric Center, Ford Rd. and Monument Ave., and Norman Flachs, M.S.W., Director, Youth Development Center at South Philadelphia, Philadelphia, Pa. 19131.

Cooperating group(s): Downingtown Industrial and Agricultural School, Downingtown; Office for Children and Youth, Pennsylvania Department of Public Welfare, Harrisburg, Pa.; Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.

Publications: Book or monograph and journal articles planned.

22-KS-2 THE TREATMENT OF CHARACTER DISORDER BY PROLONGED CONTACT WITH MATERNAL SUBSTITUTES

Purpose: To determine whether sociopathic characters can be modified through corrective maternal relationships with selected mother substitutes.

Subjects: Three sociopathic girls, age 18; three middle-aged women.

Methods: Subjects were taken from a corrective school for girls and voluntarily committed to a psychiatric hospital unit where they were administered minimal daily doses of insulin to instill hunger and anxiety. Each girl was assigned a selected maternal companion with whom she interacted spontaneously five hours daily for six months.

Findings: Close dependent relationships developed, changes in identification took place, and there was some suggestion that super-ego changes are possible.

Duration: October 1966-December 1967.

Investigator(s): Morris A. Sklansky, M.D., Staff Training Analyst, Chicago Institute for Psychoanalysis, 180 N. Michigan Ave., Chicago 60649; and Kenneth Isaacs, Ph.D., Psychologist, Neuropsychiatric Institute, 912 S. Wood St., Chicago, Ill.

Cooperating group(s): Illinois State Psychiatric Institute, Chicago.

Publications: Plan to publish in psychiatric and criminology journals.

22-KS-3 PROJECT READY (REACHING EFFECTIVELY ACTING-OUT DELINQUENT YOUTHS)

Purpose: To develop a treatment and management program for bringing about behavioral and attitudinal changes in a group of delinquents who are not reached by traditional verbal techniques; to determine whether action-oriented treatment is more appropriate for "psychopathic" individuals.

Subjects: 20 institutionalized male delinquents, ages 16 to 19, identified as highly aggressive and impulsive on the basis of behavior ratings, an analysis of life history, and a personality questionnaire; a control group.
Methods: Based on the theory that psychopathic individuals are pathological stimulation seekers, an evening and weekend program was created to minimize boredom and provide varied forms of stimulation. Activities are of both a motor and verbal nature and include programmed games, slot car racing, athletics, psychodrama, special religious programs of a moral nature, and time-out rooms for inappropriate behavior. Experimental group will be compared with contrast group on a variety of measures of institutional adjustment.
Duration: July 1967-July 1968.
Investigator(s): Gilbert L. Ingram, Ph.D., Clinical Psychologist, and R. E. Gerard, Ph.D., Superintendent, National Training School for Boys; Robert B. Levinson, Ph.D., Chief, Psychological Services, Bureau of Prisons, U. S. Department of Justice, Washington, D. C.; Herbert C. Quay, Ph.D., Research Director, Children's Research Center, and Professor of Psychology, University of Illinois, Champaign, Ill. 61820.
Publications: To be published in a correctional journal.

22-KS-4 CENTER FOR TRAINING IN DIFFERENTIAL TREATMENT

Purpose: To develop and evaluate a center for training in the differential treatment of delinquents.
Subjects: Range of correction workers from administrators to line staff, law enforcement officers, school counselors, graduate students.
Methods: Center provides training and follow-up consultation in the use of interpersonal maturity classification (I-level) and the Differential Treatment Model. The Model, developed in the California Youth Authority's Community Treatment Project, defines nine sub-types of delinquents, prescribes treatment goals, and suggests treatment methods. Impact of the training on trainees and their parent agencies is studied. (See Research Relating to Children, Bulletin No. 19-KG-1.) Line staff are assessed in a study of matching worker and client. Training methods include didactic and discussion seminars, observation of and participation in an ongoing program for delinquents (Community Treatment Project). Research methods include interviews and tests for assessment of treater styles, tests for evaluation of accuracy of diagnosis and appropriateness of treatment planning, questionnaires, and interviews (pre-, post-) to determine the impact of the training and consultation on agency program and on treatment atmospheres.
Duration: August 1967-July 1971.
Investigator(s): Marguerite Q. Warren, Ph.D., Program Director, Center for Training in Differential Treatment, Institute for the Study of Crime and Delinquency, 3610 Fifth Ave., Sacramento, Calif. 95817.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Progress reports and curriculum materials.

22-KS-5 GROUP THERAPY FOR PARENTS OF DELINQUENT WARDS

Purpose: To determine benefits of a discussion therapy group for parents of delinquents.
Subjects: Six to eight parents of children who are delinquent court wards.

Methods: In the belief that parents' attitudes and actions have considerable influence on a child's behavior, subjects were organized into discussion therapy group meeting weekly for two hours in a neutral setting. Participation in group was voluntary, and parents could discontinue but would not be re-admitted once they had dropped out. Their children were seen on a regular individual casework basis.
Findings: Parents seemed to feel relieved of some stigma and anxiety by sharing experiences with other parents; hostilities expressed in the group appeared to have an effect of temporary catharsis; small changes in philosophy and behavior have resulted; and parents seemed to have gained some insights into their behavior and that of others.
Duration: May 1966-May 1967.
Investigator(s): G. F. McGarrity, Senior Probation Officer, San Diego County Probation Department, 220 W. Broadway, San Diego, Calif. 92101. (Reported by NCCD.)

22-KS-6 GROUP MEETINGS FOR PARENTS OF GIRLS WHO ARE UNDER THE SUPERVISION OF THE COURT

Purpose: To test the hypothesis that the home environment, which was a contributing factor in delinquency, must be altered if successful rehabilitation of delinquents is to take place.
Subjects: 37 couples and 8 single parents of 44 girls and one boy under court supervision.
Methods: Parents are ordered by court to attend group meetings where the need to correct misbehavior and credit good behavior is stressed.
Findings: Most of the children whose parents attended the sessions regularly have made satisfactory adjustments and are off probation.
Duration: October 1963-not reported.
Investigator(s): Lois M. Johnson, Juvenile Court, County Building, Kalamazoo, Mich. 49001. (Reported by NCCD.)
Cooperating group(s): Fidelity Federal Savings and Loan; Juvenile Division, Kalamazoo County Probate Court, Mich.

THE CHILD IN THE FAMILY

Family Relations

22-LA-1 THE OBJECTIVE MEASUREMENT OF INTRAFAMILY ATTITUDES

Purpose: To study intrafamily attitudes of normal families, i.e., the quality of the child's relationship to his siblings and parents; to investigate the relationship between such attitudes and life experiences and other behavioral criteria.
Subjects: 120 children and their parents.
Methods: Subjects were tested on a complementary battery of objective measures of intrafamily attitudes. Data are factor analyzed and resulting factors related to life data.
Findings: Analysis of data have revealed important and complex relations between similar and antagonistic factors in children and their parents.
Duration: 1965-1967.
Investigator(s): Raymond B. Cattell, Ph.D., Research Professor of Psychology, Laboratory of Personality Group Analysis, and Karl H. Delhees, Ph.D., Assistant Research Professor, University of Illinois, Champaign, Ill. 61820; Arthur B. Sweney, Ph.D., Associate Professor of Psychology, Texas Technical College, Lubbock, Tex. 79409.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: To be published in monograph form.

22-LA-2 SOCIALIZATION

Purpose: To study effects of family role structure upon socialization, social adjustment, and educational achievement of youth in lower and middle class Negro and white families; to determine components of parental roles and their allocation, the extent to which roles are peer or hierarchical, and which are instrumental and which expressive.
Subjects: 300 families, 75 from each of four strata: lower class Negro, lower class white, middle class Negro, and middle class white.
Methods: In each family, both parents and the two oldest dependent children ages 15 to 25 are interviewed extensively in their homes. The County of Los Angeles bounds the frame, which is defined through a process of control beyond stratification, using a three by three Latin square, and racial composition, median family income, and percentage Negro as controls. Size of each of the nine strata obtained serves as a weight in control through stratification. Within each stratum, a cluster design is used, with primary sampling units based on areas of about 90 housing units, with the variance about this value reduced by combining and splitting blocks.
Findings: Pre-test data were analyzed, and the major field operation began October 1, 1967.
Duration: September 1966-August 1968.
Investigator(s): Warren D. TenHouten, Ph.D., Assistant Professor of Sociology, University of California, Los Angeles, Calif. 90024.
Publications: Journal articles planned; reprints will be available from Dr. TenHouten.

22-LC-1 FAMILY SIZE, INTERACTION, AND RELATIONSHIPS

Purpose: To test and extend propositions based on earlier research concerning effects of family size on patterns of family interaction and husband-wife and parent-child relationships.
Subjects: 600 high school students in three high schools and 2,000 mothers of children in the same schools.
Methods: Students and mothers are surveyed and data analyzed.
Duration: June 1965-December 1967.
Investigator(s): F. Ivan Nye, Ph.D., Professor of Sociology, Washington State University, Pullman, Wash. 99163.
Publications: To be submitted to a sociological journal.

22-LC-2 AN EXPLORATION OF POSSIBLE RELATIONSHIPS AMONG FAMILY VARIABLES AND SCHOOL ADJUSTMENT OF FATHER-ABSENT EIGHTH GRADE BOYS

Purpose: To investigate possible relational patterns between selected home variables and school adjustment when the father was absent from the home.
Subjects: Father-absent eighth grade boys in five midwestern cities; their mothers.
Methods: A self-perception measure of adjustment was administered to all eighth grade father-absent boys in the five cities, and highest and lowest thirds were chosen for study. Further screening eliminated those who had moved, had marked the questionnaire incorrectly, whose fathers had returned, or whose mothers had remarried. Mothers of the remaining boys were interviewed in their homes.
Findings: Mothers' positive perceptions of their present situation and actual cooperation of the sons in household tasks were significantly related to high ranking of boys on the school adjustment measure.
Duration: December 1965-January 1967.
Investigator(s): Kathryn E. Kopf, Ph.D., Assistant Professor, Department of Home Economics, University of Iowa, Iowa City, Iowa 52240.

22-LC-3 A DESERTION TYPOLOGY BASED ON A STUDY OF AFDC INCOMPLETE HOUSEHOLDS IN FIVE UPSTATE NEW YORK COUNTIES

Purpose: To explore the processes and problems associated with fatherless home situations in the Aid to Families with Dependent Children Program.
Subjects: 61 AFDC recipients residing in 56 fatherless households in five upstate New York counties.
Methods: A case schedule content analysis was made of approximately 123 questions obtained from an examination of active case records on file in the county public welfare offices, and a questionnaire of approximately 196 items was administered to the AFDC mothers in a home interview.
Findings: The modal AFDC mother had 3.7 children, had been deserted by her husband four years before and had begun to receive welfare help about nine months later. She had approximately 10 years of education and had been working within the last two years. Eighty-two percent had lived in the county of residence for over five years, and 78 percent had been born in the State. Close relatives provided tremendous within-family support for the ruptured household. The majority of families had little or no contact with other social welfare agencies outside of the local county welfare department. The welfare benefit was not seen as a

triggering process in the rupture of the family. Rather, the factors leading to desertion by the father had crystallized over a long period of time in which the gaps and deficiencies of socialization in each of the respective parent's childhood had provided them with the thinnest of personal resources to meet and cope with the onrushing and complex responsibilities of family living. After the father deserted, the mother felt isolated, was fearful of the world outside her home, and felt that the community did not really sanction her need to be on public assistance. The AFDC mothers were not basically making complaints about the minimal financial benefits. Rather, they were requesting extended social services in terms of counseling on problems of home management, personal concerns for their children, and solutions to housing and acute concerns caused by their having to assume both parental roles. Fifty-one percent stated they had severe health problems.
Duration: October 1966-May 1967.
Investigator(s): Donald L. Cohen, M.S.W., Associate Professor, State University of New York Graduate School of Social Welfare, Albany, N. Y. 12203.
Cooperating group(s): State Department of Social Services.
Publications: Article planned in Social Work and other journals.

22-LD-1 BEHAVIOR AND PERSONALITY OF MOTHERS AND CHILDREN IN WELFARE AFDC FAMILIES

Purpose: To investigate the development and presence of psychiatric impairment in children of families receiving funds under the Aid to Families with Dependent Children Program (AFDC).
Subjects: 1,000 AFDC families.
Methods: Survey focuses on psychiatric impairment in one child in each of the 1,000 families. Mother is interviewed in home, and a psychiatrist rates a computer summary of her description of her child's behavior and symptomatology. One hundred of the children with the most marked or severe impairment are seen in direct psychiatric examination; those in need of psychiatric intervention are referred to the Welfare Department of Psychiatry for treatment. Impairment in various areas of functioning is examined in relation to various aspects of family life, mother's practices, attitudes towards the Welfare Department, economic status, ethnic background, and other variables such as birth control practices and attitudes, mother's work history, current re-training interests, and chronic welfare dependency.
Findings: Children show greater impairment in AFDC families when father is present, less when mother is working; higher levels of serious psychiatric impairment and psychosis are found in children of these families than in the non-welfare children of similar economic levels.
Duration: November 1966-October 1969.
Investigator(s): Thomas S. Langner, Ph.D., Research Associate Professor of Psychiatry (Sociology); Edward L. Greene, M.D., and Joseph H. Herson, M.D., Research Scientists and Clinical Instructors (Psychiatry); Jean Jameson, M.D., Senior Research Scientist (Psychiatry); and Jeanne A. Goff, M.A., Assistant Research Scientist (Psychiatry), New York University Medical Center, 550 First Ave., New York, N. Y. 10016.
Cooperating group(s): Health Research Council and Department of Social Services of the City of New York.
Publications: Publications planned.

22-LF-1 EFFECTS OF PARENTAL MENTAL ILLNESS ON THE CHILDREN

Purpose: To determine extent of risk of psychiatric disorder to children with a mentally ill parent; to explore how and in what circumstances mental illness in one member adversely influences the mental health of other members of the family; to study effects of parental illness on family life and relationships.
Subjects: Total population of psychiatric patients living in a London borough.
Methods: Longitudinal study including measurement of clinical aspects of the psychiatric disorder, social context in which symptoms occur, impact of illness on family life, spouse's attitudes toward the patient and his or her disorder, spouse's mental state, various aspects of family life and relationships, medical and social service contacts, temperamental characteristics of the children, and behavior of children at home and at school. A detailed study of the reliability and validity of the measurement of family pathology and of various aspects of the diagnostic process in child psychiatry is being included.
Duration: Not reported.
Investigator(s): Michael L. Rutter, M.D., Senior Lecturer, Institute of Psychiatry, Maudsley Hospital, Denmark Hill, London S.E. 5, England.
Cooperating group(s): Association for the Aid of Crippled Children.

22-LF-2 EFFECTS OF A MENTAL RETARDATE ON SIBLING BEHAVIOR

Purpose: To determine any pathogenic effects of the presence of a mentally retarded child in the family on the development and behavior of its brothers and sisters.
Subjects: About 200 families newly identified as having a mentally retarded child in the Riverside schools.
Methods: Parents and siblings will be interviewed over a three- to four-year period. Performance data will be obtained from the schools.
Duration: June 1967-June 1971.
Investigator(s): E. Gartly Jaco, Ph.D., Professor of Sociology, University of California, Riverside, Calif. 92502.
Cooperating group(s): Socio-Behavioral Laboratory, Pacific State Hospital, Pomona.
Publications: Journal articles planned.

22-LF-3 POWER RELATIONS IN EMOTIONALLY DISTURBED AND NORMAL FAMILY TRIADS

Purpose: To test several hypotheses about family interaction and schizophrenia drawn from the theoretical writings of the Bateson research group; specifically, that "double-binding" is associated with the development of the schizophrenic thought disorder, and that psychopathology of an individual child is associated with a power struggle between himself and the other members of his family.
Subjects: 60 intact families in which the child is male and in which the parents are the biological parents of the child; 30 families in which the members are normal, and 30 in which the child has been diagnosed as pre-psychotic or borderline psychotic.
Methods: Each family member independently fills out a multiple choice questionnaire. A series of questionnaire items is then selected on the basis of complete disagreement between family members, and members are brought together and asked to discuss the item until a decision is reached which is agreeable to them all. Family discussions are scored by an adaptation of the Bales IPA scoring system.

Duration: June 1967-August 1968.
Investigator(s): Anthony Schuham (Ph.D. Candidate), Research Associate, Medical Care Research Center, Jewish Hospital of St. Louis, St. Louis, Mo. 63103.
Cooperating group(s): Washington University Child Guidance Clinic; Cardinal Glennon Memorial Hospital for Children; St. Louis State Hospital, St. Louis, Mo.; Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Progress reports; publication in professional journals.

22-LF-4 ADAPTATION OF ADOLESCENTS TO PATERNAL ALCOHOLISM

Purpose: To identify, study, and describe characteristic modes of adaptation to alcoholism.
Subjects: 60 males, ages 11 to 19, and 60 females, ages 13 to 19, in intact families of male alcoholics.
Methods: Study involves in-depth comparisons of successfully coping adolescents with functionally impaired ones in order to improve knowledge of which adaptational strategies seem to work better and why. Areas of adolescent functioning to be studied are social adjustment, family interactions, and personality. Studies will stress the search for causal factors in the interactional patterns within the family triad composed of adolescent under study and his parents.
Duration: October 1967-October 1971.
Investigator(s): Pauline Cohen, M.S.W., Associate Casework Director, Family Service of the Cincinnati Area, 2343 Auburn Ave., Cincinnati, Ohio 45219.
Cooperating group(s): Department of Psychology, University of Cincinnati; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Plan to publish at conclusion of project.

22-LF-5 SOCIAL WORK PROCESSES IN RURAL CHILD WELFARE SERVICES

Purpose: To discover the forms of ego disturbances which occur among mothers in Southern Appalachia whose care of their children may be marginal or actually neglectful; to test for the kinds of casework intervention most likely to be helpful.
Subjects: Various. This is a program of studies, most of which will be in family units in Western North Carolina and North Georgia.
Methods: Various, depending on the study. Will include: interview surveys; direct observation; psychometric testing; collating medical information; and the Critical Incident technique.
Findings: A preliminary study demonstrated that youngsters from an isolated, mountain community were less verbally accessible than those in a town more in the mainstream.
Duration: March 1965-August 1971.
Investigator(s): Norman A. Polansky, Ph.D., Professor of Social Work and Sociology, and Director, University of Georgia Child Research Field Station, 330 Parkway Office Building, Asheville, N. C. 28801.
Cooperating group(s): Georgia Department of Family and Children's Services; North Carolina Department of Public Welfare; Macon (County) Program for Progress, Inc.
Publications: Several papers in standard journals.

22-LF-6 A PILOT STUDY OF THE MARGINAL MOTHER

Purpose: To gain experience needed in preparation for launching a larger-scale study of the relationship between maternal personality and the child's level of living in Southern, rural Appalachia.
Subjects: 10 mothers nominated by welfare departments in two counties of Western North Carolina as having caused them grave concern about standards of child caring.
Methods: Intensive casework interviewing to gain a thorough social history on the mother; verification of the problem in child rearing in the present or recent past; psychological testing of most of the mothers; "staffing" all cases with our consulting psychiatrist.
Findings: Many of the women fit Ruesch's conception of the "Infantile Personality", i.e., pre-genitally fixated in character development. A tentative typology of the cases includes: (1) mothers who are inadequate personalities and/or were reared with very low standards themselves; (2) impulse-ridden mothers; (3) the Apathy-Futility syndrome; (4) acute psychiatric conditions; and (5) temporarily overwhelmed.
Duration: February 1967-January 1968.
Investigator(s): Norman A. Polansky, Ph.D., Professor of Social Work and Sociology, and Director, University of Georgia Child Research Field Station, 330 Parkway Office Building, Asheville, N. C. 28801; Christine De Saix, A.B., and Mary Lou Wing, M.A., Research Associates in Social Work, University of Georgia School of Social Work, Athens, Ga. 30601.
Cooperating group(s): McDowell County, N. C. and Macon County, N. C. Departments of Public Welfare.
Publications: Paper being prepared for submission to a social work journal.

22-LF-7 CHILDREN'S PROJECT

Purpose: To identify a sample of mentally or emotionally ill mothers resident in deprived urban areas and coming to the emergency room services of two general hospitals; to describe the social and health problems of children in these families; to determine whether and to what extent a planned program of services can mitigate or prevent such problems in one group of children as compared with a suitable case control. (This is the third in a series of studies concerning the impact on children of the mental disturbance of a parent. See Research Relating to Children, Bulletin Nos. 19-RS-1 and 14-U-7.)
Subjects: 35 demonstration and 35 control mothers and their families resident in Boston, Chelsea, Winthrop, and Revere, Mass.
Methods: Demonstration and control families were chosen systematically from mothers seen by the psychiatric emergency services of two large urban general hospitals. Demonstration families received social work services for one year, and this effort was evaluated; family and children's needs were also evaluated by three separate research interviews during the year. Data were obtained from school and community agencies and from pediatric examination of the children.
Findings: Children in these families frequently experienced serious social, emotional, and health deprivations, and were exposed to disturbing and demoralizing experiences in their families and neighborhoods. In general, patients received only emergency psychiatric care with little follow-up by hospitals when they did not return to out-patient clinics as recommended. The Emergency Ward psychiatric reports frequently presented data indicating that the mother's condition presented risks for child care. Families were often characterized by multiple problems presenting great difficulties to the workers, and necessitating a reduction in the previously planned caseload. Coordination of community health, welfare, and educational services was lacking in providing care for these families.

BEST COPY AVAILABLE

Duration: January 1965-December 1967.
Investigator(s): Elizabeth P. Rice, M.S., Associate Professor of Social Work, Emerita, Harvard University School of Public Health, Boston, Mass. 02115. (Reported by Leo Miller, Ph.D., Research Associate in Social Work, Department of Maternal and Child Health, Harvard University School of Public Health.)
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Results of all three studies will be published in book form, possibly in 1968.

22-LG-1 SELF-ATTITUDES OF HOSPITALIZED ADOLESCENTS

Purpose: To identify and explore the self-attitudes of hospitalized boys and girls and their attitudes toward the hospitalization experience; to find promising means of predicting behavior problems and behavior patterns of hospitalized adolescents.
Subjects: Boys and girls, ages 10 to 11, 14 to 15, 18 to 19, and 21 to 22.
Methods: Investigation will focus on attitudes of self-esteem, self- and body-cathexis, desirable patient descriptions, psychosomatic symptoms, depressive effect, self-description, and state of physical independence. Data will be analyzed to determine similarities and differences between subjects classified by sex and age.
Duration: September 1966-August 1968.
Investigator(s): Lois A. Jones, Assistant Professor of Nursing, Department of Pediatric Nursing, Frances Payne Bolton School of Nursing, Western Reserve University, Cleveland, Ohio 44106.
Cooperating group(s): Public Health Service, U. S. Department of Health, Education, and Welfare.

22-LG-2 THE PREPARATION OF THE PEDIATRIC PATIENT FOR HOSPITAL SCHOOL--A PILOT STUDY

Purpose: To study the type of preparation offered to a group of children admitted to a large general hospital which had a hospital school; to study the relationship between preparation for the hospital and the hospital school and age, race, sex, previous school experience, and reason for hospitalization.
Subjects: 78 children, ages 6 to 16, admitted to the University of Virginia Hospital in Charlottesville, Virginia.
Methods: Each child was personally interviewed with a structured questionnaire administered within the first two days of the hospital stay or when the patient's condition permitted.
Duration: March-May 1967.
Investigator(s): Janet Hammon, M.Ed., Hospital School Teacher, University of Virginia Hospital; Mary Sturdivant, M.N., Instructor, School of Nursing; Frederick L. Greene, M.D. Candidate; and Roger J. Meyer, M.D., M.P.H., Associate Professor, Department of Pediatrics, University of Virginia School of Medicine, Charlottesville, Va. 22901.
Publications: Submitted for publication.

22-LG-3 FAMILY ADAPTATION TO FATAL ILLNESS OF CHILDREN

Purpose: To study family coping strategies, mastery, vulnerability, and interaction in crisis and resolution of crisis; to predict adaptation and vulnerability in relation to crisis.
Subjects: Families with a child fatally ill with leukemia.
Methods: Longitudinal analysis of family interaction, coping strategies, role differentiation, and psychopathology on the basis of standardized ratings of interviews with parents, fatally ill children, and siblings, during different phases of illness and after the death of the child.
Duration: 1966-continuing.
Investigator(s): Edward H. Futterman, M.D., Director, Child Psychiatry Division; Melvin Sabshin, M.D., Head, Department of Psychiatry, Medical Center; and Irwin Hoffman, Research Psychologist, University of Illinois, Chicago, Ill. 60612; Joseph E. Simone, M.D., Pediatric Hematologist, St. Jude's Children's Hospital, Memphis, Tenn.
Cooperating group(s): Department of Pediatrics, University of Illinois.

22-LH-1 STUDIES IN ADOPTION

Purpose: To expand the knowledge of the progress and development of adopted children by common observations in the first year.
Subjects: 100 adopted children and 100 non-adopted children, ages 6 to 12.
Methods: Clinical examination of children and parents and a battery of psychological tests on the parents.
Findings: Parents tested so far show attitudes of overprotection and repression in early childhood and high expectations for the older child. This may account for the observed acting-out behavior disorders.
Duration: 1965-1968.
Investigator(s): Henry H. Work, M.D., Acting Chairman, Department of Psychiatry, and James Q. Simmons III, M.D., Chief, Child Inpatient Service, Neuropsychiatric Institute, University of California School of Medicine, Los Angeles, Calif. 90024.

Child Rearing

22-MB-1 THE BATTERED CHILD SYNDROME--A STUDY OF CHILD-REARING PRACTICES

Purpose: To investigate the attitudes and feelings of parents regarding child-rearing practices; to help in differentiating the psychological factors within the family milieu which contribute to the physical abuse of children.
Subjects: Families of abused children; control group of normal families.
Methods: Experimental and control families are compared on a series of scales designed to measure attitudes and feelings related to a variety of child-rearing behavior practices. In addition, 80 items of factual information regarding a wide variety of personal information on the families will be gathered and prepared for computerizing. Analysis of variance and factor analysis will be used to study the data.
Duration: July 1966-1970.

Investigator(s): Morris J. Paulson, Ph.D., Assistant Professor of Medical Psychology, University of California Medical Center, Los Angeles, Calif. 90024.
Publications: *Trauma* and three other articles in press, 1967.

22-MB-2 THE APATHY-FUTILITY SYNDROME IN CHILD NEGLECT

Purpose: To investigate the relationship between maternal personality and the adequacy of care given the young child; specifically, to investigate the prevalence of the "Apathy-Futility syndrome" and other syndromes among mothers whose children may be regarded as "neglected", and to discover methods of treating these situations via social work intervention.
Subjects: 60 to 100 mother-child pairs drawn from a year-round Head Start Program. Children are about five years of age and living with their own mothers in rural Southern Appalachia.
Methods: Mother and child are studied intensively through casework interviews, observation, and psychological testing. Data will be analyzed by cluster techniques, seeking correlations among factors indicative of levels of maternal maturity and child caring offered. Special scales have been developed in an attempt to measure the childhood level of living and the maternal characteristics.
Duration: June 1967-August 1968.
Investigator(s): Norman A. Polansky, Ph.D., Professor of Social Work and Sociology, and Director, University of Georgia Child Research Field Station, 330 Parkway Office Building, Asheville, N. C. 28801; Christine De Saix, A.B., Betty Jane Smith, M.S.W., and Robert Borgman, A.B., Research Associates in Social Work, University of Georgia School of Social Work, Athens, Ga. 30601.
Cooperating group(s): Macon Program for Progress, and Department of Public Welfare, Macon County, Franklin, N. C.
Publications: Indefinite.

22-MB-3 CHILD-REARING PRACTICES AMONG SELECTED CULTURALLY DEPRIVED MINORITIES

Purpose: To determine whether values related to child rearing differ among Papago Indian, Mexican-American, and Anglo lower class cultures.
Subjects: 50 Anglo, 50 Mexican-American, and 50 Papago Indian mothers residing in the metropolitan urban area of Tucson, Arizona.
Methods: Trained interviewers who were members of the cultural groups being studied interviewed each mother in a private session, using an adapted form of the interview schedule developed by Sears, Maccoby, and Levin (1957). Responses were compared.
Findings: Chi-square tests indicate that significant differences exist in the child-rearing practices of the three groups, the Papago Indians being the most permissive, the Anglos the harshest, and the Mexican-Americans in between.
Duration: October 1965-Spring 1967.
Investigator(s): Bessie Jean Ruley, Ph.D., Associate Professor, School of Home Economics, University of Arizona, Tucson, Ariz. 85721.
Publications: Plan to publish in *Journal of Genetic Psychology*.

22-MB-4 REINFORCEMENT OF CHILD BEHAVIOR IN THAILAND

Purpose: To discover which behaviors are praised and punished, who does the praising and punishing, and the type of punishment given to Thai, Chinese, Muslim, and children of differing regions of Thailand.
Subjects: 1,784 Thai children in grades one and four.
Methods: Children were interviewed in their native language by Thai interviewers. Findings will be compared with data to be collected from American children.
Duration: June 1965-September 1967.
Investigator(s): Jack A. Shaffer, Ph.D., Professor of Psychology, Humboldt State College, Arcata, Calif. 95521; Elmer Sundby, Ph.D., Associate Professor of Psychology, North Central College, Naperville, Ill. 60540; Chirapa Boonyapisit, M.A., Instructor in Psychology, Thammasat University, Bangkok, Thailand.
Cooperating group(s): The Asia Foundation.
Publications: Plan a monograph of the Faculty of Liberal Arts of Thammasat University; also plan to submit to Child Development, Journal of Personality and Social Psychology, or Journal of Social Psychology.

22-MB-5 DEFINING THE CONCEPT, "CHILD NEGLECT"

Purpose: To explore concrete actions or failures to act which are taken commonly, by at least some professionals, as evidences of "concern-evoking" behavior. Despite intense interest in child neglect, and related phenomena of inadequate or marginal mothering, there is no agreed-upon definition of this, either legal or, more seriously, professional. Definitions that exist are at a useless level of abstraction.
Subjects: 95 public welfare workers and public health nurses from North Georgia and Western North Carolina, all in Appalachian counties.
Methods: To avoid influencing dimensions of response, while seeking concrete illustrations, we employed a variant of Flanagan's Critical Incident technique. The critical question is, "Tell me about an instance of parental behavior which left you very concerned for the welfare of the child or children". All data are from own direct experience, rather than hearsay, preferably. Data are analyzed by developing a code empirically, testing intercoder reliability, then comparing between professional groups, and across state line, looking for differences in perceptions which may exist.
Findings: Data being analyzed, but it is already evident there will be few significant differences between perceptions of welfare workers and nurses in these rural areas. Other findings too detailed for summarization here.
Duration: July 1967-February 1968.
Investigator(s): Norman A. Polansky, Ph.D., Professor of Social Work and Sociology, and Director, University of Georgia Child Research Field Station, 330 Parkway Office Building, Asheville, N. C. 28801; Mary Lou Wing, M.A., Research Associate in Social Work, University of Georgia School of Social Work, Athens, Ga. 30601.
Cooperating group(s): Officials of the Georgia and North Carolina Child Welfare and Public Health Departments.
Publications: Plan to submit paper, tentatively titled "Toward Defining Child Neglect", to a social work journal.

22-MB-6 CROSS-CULTURAL STUDIES OF CHILD REARING

Purpose: To study the effects of social pressure on school children in the Soviet Union, Hungary, Czechoslovakia, and Switzerland; to investigate patterns of family upbringing in these countries.
Subjects: 12-year-old children representing a wide variety of socio-economic backgrounds: 165 Russians, 800 to 1,000 Hungarians, and others.
Methods: Questionnaires are administered to subjects through their schools. Both boarding and day schools have been sampled in the Soviet Union and Hungary. This research replicates investigations previously conducted in the U.S.S.R., England, and the U.S.
Duration: 1959-1971.
Investigator(s): Urie Bronfenbrenner, Ph.D., and Edward C. Devereux, Jr., Ph.D., Professors; Robert R. Rodgers, Ph.D., Research Associate, Department of Child Development and Family Relationships, Cornell University, Ithaca, N. Y. 14850.
Cooperating group(s): National Science Foundation.
Publications: *International Journal of Psychology* 2:3:199-207, 1967; *Saturday Review*, October 7, 1967, pp. 60-66.

22-MB-7 INTELLIGENCE AND INADEQUATE MOTHERING

Purpose: Previous research has shown that groups of "neglectful" mothers tested, on the average, well below normal intelligence. However, these studies typically did not compare the results with those of comparably tested mothers of similar socio-economic background, etc. This study aims to explore this problem with such a contrast group available.
Subjects: 50 mothers referred by a county department of public welfare for testing: 34 were referred as "neglect" situations, and 16 as good candidates for work program rehabilitation.
Methods: Wechsler Adult Intelligence Scale was the chief instrument on which these particular results are based.
Findings: Over one-third of the mothers referred as neglectful tested below 60 in intelligence, whereas only one of the other 16 tested this low. However, once this retarded group is subtracted, distribution of I.Q.'s among the two groups is suprisingly similar up the rest of the scale, with many of the adequate mothers also testing rather low.
Duration: July 1966-January 1968.
Investigator(s): Robert Borgman, A.B., Research Associate in Social Work, University of Georgia School of Social Work, Athens, Ga. 30601.
Cooperating group(s): Catawba County, N. C. Department of Public Welfare.
Publications: Paper in preparation for submission to social work journals.

SOCIO-ECONOMIC AND CULTURAL FACTORS

22-NB-1 POST-HIGH SCHOOL MIGRATION AND VOCATIONAL CHOICE PATTERNS OF STUDENTS FROM AN ECONOMICALLY DEPRESSED AREA

Purpose: To determine the origin of migration patterns of high school youth; to explore the social characteristics of the environment which relate to consistency or inconsistency between initial aspiration levels and resultant career activities.
Subjects: High school seniors in St. Lawrence County, New York.
Methods: Overall design is longitudinal, utilizing initial data from an earlier study of vocational plans of subjects and following up with a mailed questionnaire to be sent to them three years later. Data will also be obtained from the 18 schools attended by the graduating seniors, and will consist of personal data on the students as well as general information about the school system.
Duration: Not reported.
Investigator(s): John Harp, Associate Professor, Department of Rural Sociology, Cornell University, Ithaca, N. Y. 14850.
Cooperating group(s): State of New York.

22-NB-2 A STUDY OF YOUTH IN HIGH SCHOOL, AT WORK, AND UNEMPLOYED

Purpose: To study important areas of growth and change in adolescent boys, including dimensions of the self, values, attitudes, affective states, behaviors, plans, and aspirations; to relate such growth and change to differences within and between three broad categories of environments--school, work, and unemployment; additionally, to analyze schools as organizations; to test hypotheses derived from self-identity theory; to measure occupational information and its correlates; and to further study the causes of leaving school.
Subjects: 2,600 10th grade boys in public schools throughout the United States, 2,200 of whom constitute a representative cross-section and 400 of whom are drawn from relatively unique school environments.
Methods: Subjects participated in personal interviews and group-administered tests and questionnaires carried out in their schools in Fall 1966; they will be interviewed again in Spring 1968 and in Fall 1969, probably in their own homes. In order to effectively study relationships between growth and change variables and the various environments, it is planned to measure characteristics of persons and environments in terms of identical or commensurate concepts whenever possible. Analyses of data will begin with cross-sectional relationships based on the first data collection; however, the most extensive efforts will be reserved for analyses of changes over time as a function of differences in social environment.
Duration: June 1965-December 1971.
Investigator(s): Robert L. Kahn, Ph.D., Program Director, and Jerald G. Bachman, Ph.D., Study Director, Survey Research Center, Institute for Social Research, University of Michigan, Ann Arbor, Mich. 48104.

Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Psychological Reports 20:523-526, 1967; Working Paper 1: Blueprint for a Nationwide Longitudinal Study of Adolescent Boys. Ann Arbor, Mich: Survey Research Center, Institute for Social Research, University of Michigan; additional publications planned.

22-NC-1 MINORITY GROUP SOCIALIZATION IN HIGH SCHOOL

Purpose: To examine political orientations of Negro and white students in Athens, Ga.
Subjects: 72 ninth and 52 twelfth grade white students; 190 ninth and 125 twelfth grade Negro students.
Methods: Data were collected in 1965 in areas including role of the school in contrast with other societal agencies in transmitting political information, encouraging acceptance of democratic norms, influencing affective political orientations, and stimulating political participation. Differences among the populations and standard socioeconomic variables provide the basis for the analysis.
Duration: 1965-December 1967.
Investigator(s): William J. Crotty, Professor, Department of Political Science, Northwestern University, Evanston, Ill. 60201.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

22-NC-2 MORAL ORIENTATIONS AMONG STUDENT ACTIVISTS

Purpose: To discover moral orientations distinctive to late adolescents (college-age) who engage in various forms of pro-social action; to characterize subjects in terms of biographical data and self-descriptions of actual and ideal self; to identify retrospectively those antecedents in child rearing and parent-child relations that characterize the activists and the adolescents who are selected to typify different sorts of moral orientation.
Subjects: University of California undergraduate students arrested as participants in the Berkeley campus events of 1964; Berkeley undergraduates active in Republican, Democratic, and "New Right" organizations and a comparable cross-section from the same population; undergraduate activists in several organizations at San Francisco State College and a comparable cross-section sample; participants in several Peace Corps training programs.
Methods: Moral orientations were assessed with satisfactory reliability by a written form of Kohlberg's methods, involving the person's reasoning concerning grounds for his resolution of several moral dilemmas. Parent-child relations were assessed for mother and father by a Q-sort.
Duration: January 1966-March 1968.
Investigator(s): M. Brewster Smith, Ph.D., Professor of Psychology and Director, Jeanne H. Block, Ph.D., and Norma Haan, M.S., Research Psychologists, Institute of Human Development, University of California, Berkeley, Calif. 94720.
Cooperating group(s): Foundations' Fund for Research in Psychiatry.

22-NE-1 PORTRAITS OF THE INNER-CITY CHILD

Purpose: To investigate case studies of urban children not officially diagnosed as "disturbed".
Subjects: Children, ages 5 to 12, attending urban schools.
Methods: Extensive interviews of school personnel; review of school records; and full clinical evaluation by psychologist, psychiatrist, psychiatric social worker, and pediatrician.
Duration: September 1966-September 1967.
Investigator(s): Donald H. Clark, Ph.D., Director, Educational Clinic, Hunter College, City University of New York, Bronx, N. Y. 10468.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Results to be published in book form, 1969.

22-NE-2 THE INFLUENCE OF ARCTIC URBANISM ON BAFFIN ISLAND ESKIMO CHILD LIFE AND CHILD REARING

Purpose: To study the effects of the transitional and incipient urbanism in the Eastern Arctic on family life; to study the schools, health services, communication media, religious institutions, and economic institutions as agents of socialization in town living.
Subjects: Approximately 1,000 Eskimos living in Frobisher Bay, N.W.T., Canada and 1,000 Eskimos living in and around other Baffin Island settlements.
Methods: Participant observation of Eskimo family life, including: living in town with acculturated Eskimo family; hunting with "traditional" Eskimo family; attendance at all community events; interviews of institutional agents such as teachers, ministers, doctors, etc.; utilization of school records and Canadian government publications.
Findings: There is a consistent trend among Baffin Island Eskimos to move into urbanized areas, to accept acculturative influences favorably, and to prepare their children for a changed culture. Numerous radical changes in child rearing and style of child life have been noted in field work.
Duration: June 1967-1970.
Investigator(s): Ann P. McElroy, Ph.D. Candidate, Department of Anthropology, University of North Carolina, Chapel Hill, N. C. 27515.
Cooperating group(s): National Science Foundation; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Publication planned for Summer 1968; information available from Institute for Research in Social Science, University of North Carolina.

22-NE-3 SOCIAL MOBILITY, MATERNAL PRACTICES, AND SCHOOL ACHIEVEMENT OF NEGRO AND WHITE CHILDREN

Purpose: To make a comparative study of the processes of upward mobility among Negro and white families; to identify patterns of change in family structure and maternal practices that promote higher school achievement in children; to compare the channels of influence that promote and hinder the diffusion of maternal practices functional for achievement among upwardly mobile white and Negro mothers; to ascertain which variables of family structure differentiate upward mobiles from non-mobiles.

Subjects: 1,000 mothers of fifth and sixth grade children, Negro and white, working class and middle class, will be obtained through schools in white, Negro, and integrated neighborhoods in Chicago, Evanston, and Gary.
Methods: Interviews will be held with the mothers; I.Q., grades, and achievement test scores of the children will be obtained from schools; the effects of such variables as color, class position, class origin of parents, I.Q., sex, and ordinal position of children, and attributes of family structure such as fertility, presence of father, and maternal dominance will be ascertained.
Duration: August 1967-August 1970.
Investigator(s): Zena Smith Blau, Ph.D., Senior Research Associate, Institute for Juvenile Research, 232 E. Ohio St., Chicago, Ill. 60611.
Cooperating group(s): Research Grants Branch, Office of Research and Demonstrations, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.
Publications: To be published in professional journals.

22-NF-1 PREJUDICE AND OTHER INTERRACIAL ATTITUDES OF NEGRO YOUTH

Purpose: To investigate the nature and extent of prejudice among male and female Negro high school seniors and dropouts; to account for variations in attitudes on basis of personal background, personal experience, and school desegregation.
Subjects: 582 Washington, D. C. youth: 471 in school and 111 dropouts.
Methods: Subjects were asked about their willingness to associate with whites in diverse interracial situations through the use of a group-administered questionnaire; attention was given not only to the kind of group involved, such as church, school, or club, but also its racial composition.
Findings: Not as much "race prejudice" (defined here in terms of willingness to associate) as anticipated; degree of willingness to associate with whites varies with situation, school status of respondent, extent of informal voluntary experience with white fellow-students, and kinds of whites involved.
Duration: May 1966-August 1967.
Investigator(s): Sophia F. McDowell, Ph.D., Assistant Professor of Sociology, Howard University, Washington, D. C. 20001.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

22-NG-1 CHILD'S VIEW OF HIS CULTURE: LATIN-AMERICAN, ANGLO, AND NEGRO

Purpose: To use children as informants on their view of their culture, and to evaluate this view in terms of more conventional cultural studies, and facets of culture selected or rejected by children; to determine existence of a pattern in the selectivity of children.
Subjects: Children in grades one to six in three low income areas, representing Anglo, Latin-American, and Negro sub-cultures.
Methods: The three sub-cultures were compared on the basis of data obtained from a formal interview schedule covering daily routine, school activities, school and parental discipline, life aspirations, and attitude toward peers, which was administered individually. In addition, the Latin-American child's view was appraised in context of a larger study of children of Mexican origin in Houston.

Findings: Marked differences are emerging in the extent and nature of family influence, attitudes toward school, and achievement.
Duration: Spring-Fall 1967.
Investigator(s): Mary Ellen Goodman, Ph.D., Professor of Anthropology and Sociology, and Alma T. Beman, B.A., Graduate Student of Behavioral Science, Rice University, Houston, Tex. 77001.

22-NG-2 PROBLEM CHECKLIST RESPONSES OF ADOLESCENTS IN THREE ETHNIC GROUPS

Purpose: To study differences in perceived personal problem areas of adolescents in different cultures attending the same school system.
Subjects: Ninth grade students of Anglo, Indian, and Spanish descent in Gallup-McKinley school system from 1965-66 to 1966-67.
Methods: A 61-item problem checklist is administered anonymously to subjects with a chi-square analysis of the items.
Findings: Navajo adolescents appear more concerned with basic problems of self-worth, money, etc., while Anglos are more concerned with social success.
Duration: September 1966-June 1968.
Investigator(s): Harry L. Saslow, Ph.D., Department of Behavioral Sciences, New Mexico Highlands University, Las Vegas, N. Mex. 87701.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Paper presented at Rocky Mountain Psychological Association Meeting, 1966; publication planned.

22-NG-3 STUDY OF THE "GAMINES" IN BOGOTÁ

Purpose: To obtain generalities with which to understand the life of 3,000 to 5,000 "gamines", homeless children ages 5 to 14, whose activity oscillates between delinquency, vagrancy, neglect, and rebelliousness.
Subjects: 10 typical "gamines" and 10 deprived children who are not "gamines".
Methods: Children were studied by two social workers, two psychologists, three psychiatrists, and a sociologist-interviewer using a psychological and social methodology of the naturalistic sociology type.
Duration: Not reported.
Investigator(s): José Gutiérrez, M.D., Calle 71, No. 5-58, Bogotá, Colombia.
Cooperating group(s): Foundations' Fund for Research in Psychiatry.
Publications: Infancia de la Miseria, March 1967.

EDUCATIONAL FACTORS AND SERVICES

General

22-OA-1 PROJECT SEARCH: A FIVE-YEAR FOLLOW-UP STUDY OF DROPOUTS AND GRADUATES FROM SEQUOIA UNION HIGH SCHOOL DISTRICT SCHOOLS

Purpose: To determine (1) activities of dropouts and graduates after leaving high school; (2) reactions of dropouts and graduates to curriculum and counseling as they exist in our schools; (3) reasons for dropping out of high school and social, economic, and family factors involved; and (4) occupational opportunities available to high school graduates and dropouts.
Subjects: Approximately 500 dropouts and 1,700 graduates.
Methods: Four questionnaires are sent to subjects the first year, and one questionnaire each year thereafter. Personal interviews are held with as many participants as possible. A survey is made of opportunities available in local industry.
Duration: June 1963-June 1968.
Investigator(s): Evelyn T. Donaldson, M.Ed., Project Coordinator, Department of Guidance and Research, Sequoia Union High School District, 480 James Ave., Redwood City, Calif. 94063.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Counselor's Guide to Local Employment and Career Opportunities, June 1967; Interim Report on High School Dropouts, April 1967; Second Interim Report on Graduates, April 1966; First Interim Report on Graduates, April 1965. Available from Department of Guidance and Research.

22-OB-1 THE VALIDITY, RELIABILITY, AND FAVORABILITY OF SELECTED INDICATORS OF BEHAVIORAL CHANGE IN CHILDREN

Purpose: To investigate the merit of a large group of psychometric items as indicators of behavioral change in children; to provide a means for assessing the effect of guidance upon the personal adjustment of elementary age students.
Subjects: Elementary school children.
Methods: A 945-item schedule was established describing changes which might occur in a child's behavior as the result of counseling. Data are collected to determine the validity of these items for predicting successful counseling outcome, their favorability or social desirability, and the reliability of favorability ratings.
Findings: Results should prove valuable for providing objective means for assessing effect of child guidance, and in stimulating research interest in outcome studies and the evaluation of guidance programs.
Duration: Not reported.
Investigator(s): Logan Wright, Ph.D., Director of Psychological Services, University of Oklahoma Medical Center, Oklahoma City, Okla.; Richard Nelson, Assistant Professor, Department of Education, and Fae

H. Spurlock, M.D., Psychiatrist, Student Health Center, Purdue University, Lafayette, Ind. 47907.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

22-OB-2 USE OF STRUCTURED GROUP COUNSELING FOR PARENTS OF PRE-DELINQUENT AND/OR EMOTIONALLY DISTURBED CHILDREN

Purpose: To estimate the value of guidance for parents of children just beginning to show symptoms of pre-delinquency or emotional disturbance but not needing therapy.
Subjects: Parents referred by school nurse, county agencies, school principals, school guidance systems, and welfare and attendance officers.
Methods: Parents are taught rudiments of discipline, etc., and then allowed to discuss their own situations within the group.
Findings: Parents referred by welfare and attendance officers tend not to come unless pressured. Biggest problem is getting parents to accept the program; once there, they do well. School data on children confirm improvement.
Duration: 1964-continuing.
Investigator(s): Lorna M. Forbes, M.D., Psychiatrist, Guidance Department, Pomona Unified School District, Pomona 91767; and Associate Clinical Professor of Child Psychiatry, University of Southern California Medical School, Los Angeles, Calif. 90033.
Cooperating group(s): PTA Council of Pomona.
Publications: Plan to publish in 1968.

22-OF-1 SIMULATION GAMES IN THE CLASSROOM

Purpose: To develop simulation games for use in elementary and secondary schools; to field-test such games in a wide variety of settings; and to evaluate learning effects of games.
Subjects: Elementary, high school, and college students, and adult groups, all representing a wide range of socio-economic, ability, and interest levels.
Methods: Controlled experiments where possible through necessarily open-ended and exploratory tests.
Findings: Games have positive effects upon motivation, content and intellectual learning, and attitudes toward self, school, and learning.
Duration: July 1962-continuing.
Investigator(s): James S. Coleman, Ph.D., Professor of Sociology, and Sarane S. Boocock, Ph.D., Research Associate, Department of Social Relations, Johns Hopkins University, Baltimore, Md. 21218.
Cooperating group(s): Carnegie Corporation; Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Simulation Games and Learning Behavior, S. S. Boocock and E. O. Schild (Eds.). Beverly Hills: Sage Publications, 1967; American Behavioral Scientist, October and November 1966; Sociology of Education 39:215-236, Summer 1966; others.

22-OF-2 RESEARCH STUDY OF LEARNING DISABILITIES

Purpose: To derive criteria for early identification and diagnosis of children with learning disabilities by determining the most sensitive and valid behavioral and medical indicators.
Subjects: Public school children in grades three and four.

Methods: Children are screened to identify those with learning disabilities. These underachievers and an equal number of "normal" children are evaluated intensively to validate the screening procedures and to determine whether there is evidence of brain dysfunction.
Duration: June 1965-May 1969.
Investigator(s): Helmer R. Myklebust, Ed.D., Director, Institute of Language Disorders, Northwestern University, Evanston 60201; and Benjamin Boshes, M.D., Chairman, Department of Neurology, Northwestern University School of Medicine, Chicago, Ill. 60611. (Reported by Otis D. Turner, Chief, Program Studies, Neurological and Sensory Disease Control Program, Public Health Service, U. S. Department of Health, Education, and Welfare, 4040 N. Fairfax, Arlington, Va. 22203.)
Cooperating group(s): Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Publication planned.

22-OF-3 THE RELATION OF SEX ROLE TO ACHIEVEMENT

Purpose: To investigate the degree to which children view different types of achievement as sex-typed and the relation of these views to achievement motivation; to determine whether boys and girls value different types of reinforcement for achievement efforts.
Subjects: Primarily elementary school children; some adolescents.
Methods: Children's sex role concepts of different types of achievement are measured by presenting pictures representing reading, arithmetic, etc., and asking them whether they consider the activity more boyish or girlish. Measures of achievement motivation consist of questionnaires tapping the value and expectation of success in each achievement area and of behavioral indices such as persistence. Effects of different types of social reinforcement or non-reinforcement are measured by changes in rate of response on a digit-letter task.
Findings: Children generally have higher expectancies of success on a task presented as feminine than on a masculine task. Children view reading, artistic, and social skills as feminine, and arithmetic, athletic, and mechanical skills as masculine. Boys show an increase in effort when their work is criticized, while girls show a decrease. Both sexes show large increases when they are praised.
Duration: January 1967-continuing.
Investigator(s): Aletha Stein, Ph.D., Assistant Professor, Department of Child Development and Family Relationships, Cornell University, Ithaca, N. Y. 14850.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: To be submitted to a psychological journal concerned with personality research.

22-OF-4 SOCIOLOGICAL INFLUENCES UPON THE ACHIEVEMENT OF LOWER CLASS NEGRO CHILDREN

Purpose: To study the relationships between the schools and the social structure of a virtually all-Negro suburb of a northern metropolis: specifically, to study the nature and effects of economic deprivation upon school children, the school-family relations, and school-community relations and school politics.
Subjects: 226 children from grades four and six; their teachers and school officials; 89 percent of their mothers or female guardians.

Methods: Data on familial support for achievement were gathered from interviews with parents, questionnaires filled out by children, and school records. Study on effect of school-family relations on achievement relied primarily on informal conversations with teachers and information they provided about nature and extent of their contacts with parents. School-community relations were explored through semi-structured interviews with local actors in school affairs, collection of election documents, and use of newspaper reports.
Findings: Although family background clearly was related to achievement, the relationship was much weaker than had been suggested by the cultural deprivation literature and by local teachers. Most parent-teacher contacts were found to be initiated by the teachers when the children were doing poorly. Extensive conflicts between "old-timers" and reformers within the community were found to center on control of the local school board.
Duration: February 1966-December 1967.
Investigator(s): Robert J. Parelius, Ph.D., Assistant Professor, Department of Economics and Sociology, Douglass College, New Brunswick, N. J. 08903.
Cooperating group(s): The Center for the Study of Social Organization, University of Chicago; Institute for Juvenile Research, Chicago; Office of Education, U. S. Department of Health, Education, and Welfare.

22-OF-5 FAMILY PRESS AND EDUCATIONAL DEVELOPMENT

Purpose: To explore the relationship between students' academic growth over a four-year period and family press (process variables) within and between socio-economic strata (status variables).
Subjects: Random sample of students in the fifth and seventh grades in 1961, and tested again in 1965, drawn from a nationwide sample of 40,000 students, who are the subjects in a Growth Study of the Educational Testing Service.
Methods: Analysis of covariance technique and Johnson-Neyman test of significance were used to assess the effect of family press on academic growth within and between socio-economic strata.
Duration: January-September 1967.
Investigator(s): Donald L. Lantz, Ph.D., Associate Professor of Educational Psychology, College of Education, University of South Florida, Tampa, Fla. 33620; and Thomas L. Hilton, Ph.D., Senior Research Psychologist, Educational Testing Service, Princeton, N. J. 08540.
Publications: Research Bulletin will be available from investigators.

22-OF-6 A COMPARISON OF HYPERACHIEVING LOWER CLASS FIRST GRADE PUPILS WITH UNDERACHIEVING COUNTERPARTS

Purpose: To identify characteristics in the backgrounds of hyperachieving lower class first grade pupils which differentiate them from a matched group achieving at typically reduced level for culturally disadvantaged pupils.
Subjects: 31 pairs of lower class hyperachievers and a control group matched for sex, classroom, and I.Q., all from a population of 687 first grade children in Buffalo, N. Y. public schools.
Methods: Subjects are differentiated on the basis of the Gates-McGinitie Reading Test into two groups of 31 each, hyperachievers and the typically slow (for the lower class) in beginning reading. Data concerning home conditions are derived from PARI, and teachers are asked to appraise aspects of the children's backgrounds.

Duration: January-December 1967.

Investigator(s): Delcenia Powell, Ed.D. Candidate, Department of Elementary Education, Texas Southern University, Houston, Tex. (Reported by William Eller, Ph.D., Chairman, Elementary Education Department, School of Education, State University of New York, Buffalo, N. Y. 14214.)

Publications: Dissertation will be available.

22-OF-7 COPING STYLES AND ACHIEVEMENT: A CROSS-NATIONAL STUDY OF CHILDREN

Purpose: To investigate the ways in which children deal with certain kinds of problems in and out of school; to show how this relates to their achievement in school, and to their educational and occupational aspirations and expectations; to investigate these areas across nations for similarities and differences.

Subjects: 800 male and female upper-middle and upper-lower class children, ages 10 and 14, in seven countries; parents of 10 percent of the sample.

Methods: Ten paper and pencil tests are applied in class to all subjects and analyzed for coping style and attitude toward achievement, interpersonal relations, authority, anxiety, and aggression; peer evaluation instrument is analyzed for these areas also. The educational and occupational aspiration and evaluation instruments are compared with the coping style data and supply additional material on children's attitudes and knowledge in these areas. The interviews with parents are aimed at getting similar information about the children.

Duration: June 1965-June 1970.

Investigator(s): Robert F. Peck, Ph.D., Professor of Educational Psychology, University of Texas, Austin, Tex.; and Robert J. Havighurst, Ph.D., Professor of Education, University of Chicago, Chicago, Ill. 60637. (Reported by Guy J. Manaster, University of Chicago.)

Cooperating group(s): Universities at the foreign stations; Office of Education, U. S. Department of Health, Education, and Welfare.

Publications: Plan to publish at completion of analysis.

22-OF-8 PROBLEMS OF SLOW LEARNERS

Purpose: To empirically establish incidence and prevalence of classroom problems attributed to slow learners.

Subjects: 2,500 public school students in grades two through seven, and nine.

Methods: Teachers were asked to indicate, on a specially designed instrument, which children in their class had problems in each of the 16 problem areas selected. Data on I.Q., birthdate, race, etc., were then collected, and prevalence of problems among slow learners (I.Q. 70-90) was calculated.

Findings: Preliminary findings indicate most problems generally attributed to slow learners are actually more often found among this population than among "normals".

Duration: February-November 1967.

Investigator(s): John F. Jacobs, M.Ed., Doctoral Fellow, Myron A. Cunningham, Ed.D., Professor, and Marnell L. Pierce, M.Ed., Instructor, College of Education, University of Florida, Gainesville 32601; Arnold D. Cortazzo, Ed.D., Director, Sunland Training Center, Miami, Fla.

Cooperating group(s): Florida Educational Research and Development Council.

Publications: To be published as a monograph by Florida Educational Research and Development Council.

BEST COPY AVAILABLE

22-OF-9 SOME SOCIAL DETERMINANTS OF ACADEMIC SUCCESS AMONG CULTURALLY DISADVANTAGED NEGRO CHILDREN

Purpose: To identify factors that contribute to academic success among culturally disadvantaged Negro children.
Subjects: 56 sixth grade children living in two of the lowest income areas of an urban setting; their mothers or guardians.
Methods: The social determinants of academic success, namely, the family structure, aspirational level, and self-concept, were measured by a designed children's questionnaire, the North-Hatt Scale, the Davidson and Lang Self-Concept Scale, a parental questionnaire, and interviews.
Findings: Self-image of the Negro child is not related to his academic achievement. There is no relation between academic success and having both parents in the home.
Duration: 1966-1967.
Investigator(s): Bonita Franks, Ph.D., University of Tennessee, Knoxville, Tenn. 37916. (Reported by John D. McAulay, Ed.D., Professor of Elementary Education, Pennsylvania State University, University Park, Pa. 16802.)
Cooperating group(s): Department of Elementary Education, Pennsylvania State University.
Publications: Unpublished doctoral dissertation available at Pattee Library, Pennsylvania State University.

22-OK-1 A STUDY OF CHANGE AGENTS: NEGRO STUDENTS WHO ARE DESEGREGATING ALL-WHITE SCHOOLS IN THE DEEP SOUTH

Purpose: To investigate social backgrounds, personality characteristics, decision-making processes, and experiences of selected Southern Negro youngsters who have desegregated previously all-white public schools.
Subjects: Approximately 100 Negro students in desegregated schools, their families, and teachers throughout rural and urban areas of Alabama; control sample of Negro students from similar backgrounds who are not attending desegregated schools.
Methods: Interviews were conducted and analyzed, and comparisons made between the two groups to clarify personal and social characteristics of educational and community change agents.
Findings: Analysis of interviews should provide a record of perceptions and reflections on the desegregation process in Southern schools, contribute to a better understanding of some of the issues and experiences of social change agents, and yield knowledge helpful to public planning for educational change in the near future. The study has special relevance for the training of Southern teachers to manage desegregated classrooms, and the preparation of Negro and white school and community authorities to work with the desegregation process.
Duration: Completed.
Investigator(s): Dr. Mark Chesler, Instructor in Sociology, and Phyllis Segal, (formerly) Center for Research on the Utilization of Scientific Knowledge, Institute for Social Research, University of Michigan, Ann Arbor, Mich. 48104.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

Specific Skills

22-PB-1 A FOLLOW-UP STUDY OF OFF-CAMPUS STUDENTS WHO ATTENDED THE UNIVERSITY OF FLORIDA READING LABORATORY AND CLINIC

Purpose: To determine the present reading ability of off-campus students who attended the University of Florida Reading Laboratory and Clinic.
Subjects: About 175 off-campus students who attended the clinic during 1957-58 through 1962-63, had at least 10 hours of remediation and a standardized pre-test, and are young enough to still be in school.
Methods: A letter of introduction is sent, and those willing to participate in the study return a card indicating this. They are then sent an untimed standardized test and the Reading Attitude Inventory, which reveals the student's concept of his reading ability and his level of education attained. Statistical analysis is performed on all returned information; reading gains are determined through Residual Gain Technique.
Duration: April-August 1967.
Investigator(s): Evelyn W. Stone, Reading Laboratory and Clinic, University of Florida, Gainesville, Fla. 32601.
Publications: Unpublished dissertation.

22-PB-2 A SUGGESTED METHOD FOR PRE-SCHOOL IDENTIFICATION OF READING DISABILITY

Purpose: To develop relatively simple methods of detecting reading disabilities prior to entrance into first grade.
Subjects: 200 children.
Methods: Subjects are pre-tested on form-copying, tests of reversals and rotations, tests of motor ability, and apparent tests of perceptual ability, and results arranged from lowest to highest scores, divided into quartiles. During the final month of the first year in school, word recognition tests are administered individually and scores examined and compared with pre-test scores to determine if the pupils who scored in the lowest quartile of the pre-tests score in the lowest one-third in word recognition. As an additional evaluation of the modifiability of perceptual skills and their relation to reading abilities, five children in the lowest quartile of pre-tests will be given perceptual training during first grade and scores on word recognition compared with scores of five matched children who do not have the perceptual training.
Duration: Not reported.
Investigator(s): Kenneth R. Newton, Ph.D., Associate Professor, and Beulah B. Murray, Educational Therapist, Department of Psychology, University of Tennessee, Knoxville, Tenn.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

Special Education

22-QA-1 DISCOVERY AND GUIDANCE OF SUPERIOR STUDENTS

Purpose: To develop procedures that can be used in high schools to identify academically superior students; to assist parents in the home guidance of these students; and to determine, by follow-up methods, the effectiveness of the procedures employed.
Subjects: 2,400 students: group of freshmen in high school, and group now six years out of high school; 250 freshmen added each year.
Methods: Longitudinal testing; analysis of personal documents; follow-up questionnaires and interviews with parents, school personnel, and students.
Duration: February 1957-1982.
Investigator(s): John W. M. Rothney, Ed.D., Professor of Counseling, and Director, and Marshall P. Sanborn, Ph.D., Associate Professor of Counseling, and Associate Director, Research and Guidance Laboratory for Superior Students, University of Wisconsin, Madison, Wis. 53706.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Several volumes planned.

22-QB-1 DEVELOPMENT AND EVALUATION OF AN EXPERIMENTAL SCHOOL FOR HIGH-POTENTIAL UNDERACHIEVERS

Purpose: To develop and test improved means for educating underachievers.
Subjects: 350 eighth grade underachievers of average or above-average potential.
Methods: Students attend the North Carolina Advancement School for three-month periods, during which an intensive effort is made to correct their educational deficiencies. School focuses on development of basic skills and promotion of attitudes and motivational patterns which lead to effective performance. Fifty classroom teachers assist the staff with preparations and evaluation of the program.
Findings: Experiment will determine which new materials and methods will help to alleviate educational disadvantages in the eighth grade, with emphasis on students of above-average potential who are achieving from one to three grades below national norm. The newly developed and tested materials will be made available for use in other schools.
Duration: Not reported.
Investigator(s): Gordon McAndrew, Director, Learning Institute of North Carolina, 1006 Lamond Ave., Durham, N. C. 27701.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

22-QC-1 FOLLOW-UP STUDY OF GRADUATES OF TWO SPECIAL EDUCATION PROGRAMS

Purpose: To compare occupational, social, and familial status of graduates from high school programs for educable retardates.
Subjects: 50 graduates of Kent County program, 1960-1965; 150 graduates of Dearborn, Mich. program, 1945-1965.

Methods: Graduates and a few parents are interviewed to complete a questionnaire covering post-school experiences. Items covered included occupational history, parent status, income, post-school education, community participation, family status (marriage, children), etc. Comparisons were made between school systems, and between graduates of Dearborn by five-year periods.
Findings: There are slight differences between the two school programs. The income, marital status, and social participation of graduates of special classes are not significantly different from the general population in mean income, age at marriage, etc.
Duration: September 1966-June 1967.
Investigator(s): Marie Skodak, Ph.D., Consultant, Psychological Services, Dearborn Public Schools, 4824 Lois Ave., Dearborn, Mich. 48126.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: To be submitted to *Journal of the American Association on Mental Deficiency*.

22-QD-1 COMBINED EDUCATIONAL AND PSYCHIATRIC APPROACH TO EARLY PRIMARY GRADE LEARNING PROBLEMS

Purpose: To establish effectiveness of a combination of regular class, three hours weekly of special class, and therapeutic intervention in alleviating early-identified learning problems.
Subjects: First and second grade children in a suburban public school.
Methods: Children are selected by teachers and research staff from records and teachers' behavioral checklist. Some children attend special class only, some attend special class and weekly group therapy sessions with parents, and a control group is selected from clinic rolls for treatment only. Special class consists of a highly individualized educational enrichment and tutoring program, conducted in groups of three to four, by a trained special class teacher. Therapy is modified to allow for reluctance of parents to gain sufficient motivation to ally with the team.
Findings: Cases could be selected, but parents strongly resisted active involvement in program, preferring to deny degree of child's disturbance. Those few cases actually involved in combined approach made highly significant educational gains.
Duration: July 1966-July 1968.
Investigator(s): Jack Slatoff, Ph.D., Chief Psychologist, Douglas A. Thom Clinic for Children, 315 Dartmouth St., Boston, Mass. 12116. (Reported by John B. Nelson III, M.D., Executive Director, Douglas A. Thom Clinic for Children.)
Cooperating group(s): Melrose, Massachusetts public schools.
Publications: Presentation and publication planned.

22-QE-1 EFFECTS OF PROJECT HEAD START ACTIVITIES UPON THE ORAL LANGUAGE DEVELOPMENT OF FIRST GRADE PUPILS

Purpose: To evaluate effects of Project Head Start activities in the enhancement of the oral language development of participant children.
Subjects: First grade pupils: one group of Head Start participants; comparable control group of non-participants.
Methods: Two groups are compared on 20 oral language variables including total number of words in recorded interview transcripts; number and length of phonological units; number and length of sentences; number and length of mazes; number of non-maze words

between mazes; vocabulary diversity (three aspects); vocabulary frequency (three aspects); use of the noun-linking verb-noun sentence pattern; use of partial sentences; number of expressions of tentativeness; number of colorful and vivid expressions; and use of mazes (two aspects).
Duration: Not reported.
Investigator(s): Douglas E. Giles, Ed.D., Lemon Grove School District, 1750 Madeira St., Lemon Grove, Calif. 92045; and Artie A. Daniel, Ed.D., Associate Professor of Education, North Texas State University, Denton, Tex. 76203.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

22-QE-2 RESEARCH PROPOSAL FOR THE PRE-SCHOOL READINESS CENTERS PROGRAM

Purpose: To evaluate the effectiveness of a pre-school program for disadvantaged children.
Subjects: Disadvantaged children entering first grade with pre-school experience, summer Head Start experience, or no pre-school experience.
Methods: Experimental children are given pre- and post- intelligence tests and tests of personal and social adjustment. School readiness and other tests are administered to all subjects upon entering first grade. Subjects will also be given an achievement test at end of school year.
Findings: Preliminary analysis indicates that children experiencing the pre-school readiness program score significantly higher on the Peabody Picture Vocabulary test and the Metropolitan Readiness test than do children without such experience.
Duration: July 1967-June 1968.
Investigator(s): M. L. Bittner, M.A., Research Director, Readiness Centers Evaluation, Center for the Study of Crime, Delinquency, and Corrections, Southern Illinois University, Edwardsville, Ill. 62025.
Cooperating group(s): East St. Louis School District 189; Division of Research and Evaluation, U. S. Office of Economic Opportunity.
Publications: May submit for publication.

22-QE-3 THE EFFECTS OF CURRICULAR AND ADMINISTRATIVE INNOVATIONS ON ATTITUDE OF CULTURALLY DISADVANTAGED YOUTH

Purpose: The need for identifying the factors related to the attitudes of the culturally different pupil toward achievement and educational institutions, and preparing teachers untrained and unaccustomed to working within integrated schools led to a Special Training Institute on Problems of School Desegregation. Primarily, the purpose was twofold: to determine the effects of a specific educational and social experience, and to train a cadre of new professionals experienced with problems of desegregation.
Subjects: 200 culturally disadvantaged children, grades 4 to 6: 100 Negro, 50 Latin, and 50 Anglo children, about equally divided between boys and girls. All attended the school on a voluntary basis.
Methods: The students were placed in groups of 10 per room, with three teachers per group to handle a curriculum composed chiefly of language arts, mathematics, and human relations. Materials, methods, and administrative schedule were as innovative and individualistic as possible. Scales and tests administered before and after the program are the basis for evaluation. The FORTRAN Program will be used to treat the data by analysis of covariance in which the post-test scores will be corrected for differences in pre-test scores.

Findings: Attendance, attitude, and behavior toward the school indicated the success of teaching approach, material utilized, and organization and administrative innovations. The preliminary analysis between pre- and post-tests of each instrument indicates gain. The data have been submitted to statistical treatment for an analysis of covariance, product-moment correlation, and z test for significance at the .01 and .05 level of confidence.
Duration: June-August 1967.
Investigator(s): Charleta J. Dunn, Ed.D., Assistant Professor, Department of Guidance and Counseling, and John L. Creswell, Ed.D., Associate Professor, College of Education, University of Houston, Houston, Tex. 77004.
Cooperating group(s): St. Thomas University; Texas Southern University; Prairie View A. & M. College; Houston Baptist College; Harris County Community Action Association; Hogg Foundation for Mental Health; Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Plan several manuscripts and possibly a monograph including descriptions of materials, methodology, and conclusions.

22-QE-4 REPORT OF THE EFFECTIVENESS OF PROJECT HEAD START, LUBBOCK, TEXAS

Purpose: To measure Project Head Start's effectiveness in preparing disadvantaged children to benefit from educational opportunities.
Subjects: Experimental and control groups matched for characteristics such as ethnicity, income range, parents in home, education of parents, working status of mother, public assistance, type of work of parents, size of household or number of children, care of child during prior year, health of child, parental awareness of health problems, and rural-urban residence.
Methods: Children's grades as indicators of "performance" in and "adjustment" to school work are compared with grades of controls as an objective measurement of Project Head Start.
Duration: Not reported.
Investigator(s): Walter J. Cartwright, Ph.D., Associate Professor, and W. G. Steglich, Ph.D., Professor and Head, Department of Sociology and Anthropology, Texas Technological College, Lubbock, Tex. 79406.
Cooperating group(s): U. S. Office of Economic Opportunity.

22-QE-5 INTERACTION PATTERNS AS A SOURCE OF ERROR IN TEACHERS' EVALUATIONS OF HEAD START CHILDREN

Purpose: To determine whether teachers' inabilities to accurately assess the intelligence and school readiness of Head Start children is a function of the interaction patterns of these children; specifically, to test the hypothesis that those children who exhibit middle class interaction patterns are perceived by the teachers as being brighter than those who do not exhibit such patterns.
Subjects: 40 Head Start children; 40 middle class controls.
Methods: Each child is observed according to a highly structured observation schema by trained observers for five 20-minute periods. The interaction profile is then developed for each child. The 20 Head Start children whose interaction profile is most like that of the middle class will be compared with the 20 whose interaction profile is least similar. Stanford-Binet and Caldwell inventories administered to all Head Start children will give actual measures of intelligence and school readiness, against which to study teachers' ratings of these variables.

Duration: November 1967-April 1968.
Investigator(s): Monica Holmes, Ph.D., and Douglas Holmes, Ph.D., Director of Research, Associated YM-YWHA's, 33 W. 60th St., New York, N. Y. 10023.

22-QE-6 A PROFILE OF THE HEAD START CHILD, SUMMER 1966

Purpose: To determine actual needs of children enrolled in Head Start centers, and the extent of these needs.
Subjects: 1,350 children enrolled in the 1966 Head Start summer program in Kansas City, Mo.
Methods: Data from individual pupil record cards were recorded and analyzed to determine the need characteristics of the Head Start child during his pre-school experience. Data pertained to location of Head Start center, number of days in attendance, family composition, social behavior based on teacher's rating scale, results of the Caldwell Pre-school Inventory, speech and language development as assessed by speech pathologists, social and psychological services, and location of the kindergarten which the child attended.
Duration: June 1966-June 1967.
Investigator(s): Elizabeth J. Hocker, M.S.W., Research Assistant, Department of Research and Development, Kansas City School District, 1211 McGee St., Kansas City, Mo. 64106.
Cooperating group(s): U. S. Office of Economic Opportunity.
Publications: Mimeographed report available from investigator.

22-QE-7 THE EFFECTS OF HETEROGENEOUS GROUPING AND COMPENSATORY MEASURES ON CULTURALLY DISADVANTAGED PRE-SCHOOL CHILDREN IN ISRAEL

Purpose: To study whether privileged peers can serve as an enriching influence within the framework of a compensatory program for culturally disadvantaged pre-school children.
Subjects: 96 pre-school children in Jerusalem, Israel, born during 1964.
Methods: The subjects will be divided among four pre-schools. One group of 24 culturally disadvantaged children will be assigned to one pre-school. In each of the others there will be eight culturally disadvantaged and 16 privileged pupils. The same compensatory measures will be applied in all four pre-schools.
Duration: April 1967-April 1970.
Investigator(s): Dina Feitelson, Ph.D., Lecturer, John Dewey School of Education, Hebrew University; and Sylvia Krown, M.A., Psychologist, Israel Ministry of Health, Jerusalem, Israel.
Cooperating group(s): Israel Ministry of Education and Culture; The Municipality of Jerusalem; Office of International Activities, Office of Research and Demonstrations, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.
Publications: Articles planned in appropriate journals.

22-QE-8 DEVELOPMENT OF VERBAL SKILLS FOR CULTURALLY DEPRIVED CHILDREN

Purpose: To demonstrate that verbally mediated discrimination enhances the learning and retention of two separate classes of responses in culturally disadvantaged elementary school children.

Subjects: Culturally disadvantaged school children, ages 10 to 12.
Methods: Subjects are randomly assigned to five groups of 30 each. Each group is given a type of mediated generalization-discrimination training, and all groups will receive the same treatments in interpolated learning and in the test for retention. Measures of learning used include number of responses and latency to the criterion of five out of seven correct responses. Second phase of project will involve more complex concepts and hierarchical relationships. Data will be analyzed by a one-way analysis of variance and covariance. A Neuman-Keuls, Scheffe, or Duncan test will be computed to compare differences among means.
Duration: Not reported.
Investigator(s): Merlin C. Wittrock, Ph.D., Associate Professor of Educational Psychology, and Harold Cook, Post-graduate Research Educationist, Department of Education, University of California, Los Angeles, Calif. 90024.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

22-QE-9 A COMPARATIVE PILOT STUDY OF TWO FIRST GRADE PROGRAMS FOR CULTURALLY DEPRIVED MEXICAN-AMERICAN CHILDREN

Purpose: (1) To develop a first grade program in social studies and science for culturally disadvantaged Mexican-American children in which the content is taken from basic concepts in the natural and social sciences; (2) to experiment with methods of teaching the selected content which give major consideration to the cognitive "styles" of all young children and especially culturally disadvantaged ones; (3) to support the development of self-esteem through recognition of independent thinking and attention to the particular needs of individuals; (4) to assist teachers in preparing to use the program; and (5) to compare the language development of children in the experimental program with that of children in regular programs.
Subjects: Six groups of first grade children with 30 in each group, attending two elementary schools located in adjoining districts in a community of culturally disadvantaged Mexican-Americans. Three classes in one school received the enriched program, and the other three, matched for cultural background, chronological age, sex, and readiness test scores, received the regular program.
Methods: Data were derived from pre- and post-tests and classroom observation.
Findings: Results in final report.
Duration: February 1966-May 1967.
Investigator(s): Clyde Inez Martin, Professor of Elementary Education, University of Texas, Austin, Tex. 78712.

22-QE-10 VARIOUS APPROACHES TO BEGINNING READING FOR DISADVANTAGED CHILDREN

Purpose: To discover (1) whether the point at which beginning reading is introduced (kindergarten, first grade, or delayed second grade) affects the reading mastery of disadvantaged children; (2) whether a carefully structured program dealing with perceptual discrimination, language development, and concept formation administered to children prior to the instruction of formal reading improves their later reading facility; (3) the degree to which the regularization of the phoneme-grapheme correspondence in the language is related to reading achievement; (4) the degree to which the relatedness to the life of urban children of the context from which reading materials are drawn affects their reading competence.

Subjects: The study began with 7,000 kindergarten children in 56 New York City elementary schools. As many children as remain within their schools will be followed through the end of third grade. If possible, further follow-up will be made at end of grade six.
Methods: In order to answer the questions listed above, series of materials were found or developed to enable us to view each of the major areas of concern in interaction with each other. Thus some classes began reading by a variety of approaches in the middle of kindergarten, others at the beginning of grade one, and still others had reading postponed until the end of grade one. Some classes began reading in the traditional orthography of normal basal texts, other groups worked with a "linguistic" approach in which only regularly spelled English words were involved, and a third group worked in the i.t.a. For each of these adaptations of time and structure the materials selected were either of the children's own designing, planned to be directly relevant to the experiences of urban slum children, or of general children's interests. In some instances the relatively standard middle class suburban type material was introduced. To assess the effect of an intensive, highly structured pre-reading program emphasizing perception, language, and concept development, a series of specially prepared materials was designed. In all programs teachers were given special training (10 sessions prior to the inception of their entry into the project and six sessions during their participation) in the use of the particular adaptations with which they were involved. Children were pre-tested in the middle of kindergarten and again at the end of kindergarten. In November 1967 a sub-sample of children was once again tested to study the phenomenon of "summer forgetting". At the end of first grade, all children will be tested on materials specifically designed for each program.
Duration: Not reported.
Investigator(s): Miriam L. Goldberg, Ph.D., Professor of Psychology and Education, Beginning Reading Project, Teachers College, Columbia University, New York, N. Y. 10027.

22-QG-1 A STUDY OF THE EFFECTIVENESS OF SELECTED OUT-OF-SCHOOL NEIGHBORHOOD YOUTH CORPS PROGRAMS

Purpose: To evaluate effectiveness and determine potential value of Neighborhood Youth Corps programs on participating non-rural youth who are no longer in school; to evaluate selected program elements in four cities.
Subjects: Participants in Neighborhood Youth Corps programs; control subjects.
Methods: In-depth follow-up studies comparing experimental and control subjects.
Investigator(s): Regis H. Walther, Ph.D., Social Research Group, George Washington University, Washington, D. C. 20006.
Cooperating group(s): Office of Manpower Policy, Evaluation, and Research, U. S. Department of Labor.
Publications: Final report, June 1967.

22-QH-1 KINDERGARTEN INTERVENTION PROJECT

Purpose: To study effect of small classes, teacher aides, supplemental nutrition, and enriched program on school readiness of kindergarten children.
Subjects: 90 children in special program and 90 in a regular kindergarten.

Methods: Children are assigned to experimental program on basis of physical, psychological, visual-perceptual, etc., immaturity and given a markedly enriched program. Emphasis is on verbal skills, concept development, and visual-motor coordination. The more mature half of the class is attending regular kindergarten.
Duration: May 1966-1969.
Investigator(s): Marie Skodak, Ph.D., Consultant, Psychological Services, Dearborn Public Schools, 4824 Lois Ave., Dearborn, Mich. 48126.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: To be submitted to Monographs of the Society for Research in Child Development.

22-QH-2 IDENTIFICATION AND HABILITATION OF INDIAN CHILDREN WITH COMMUNICATION DISORDERS

Purpose: To investigate the incidence and type of communication disorders among Indian school children; to establish a follow-up program to modify effects of these disorders.
Subjects: Students at the Intermountain Indian School, Brigham City, Utah.
Methods: Audiometric screening and assessments; immediate educational adjustments; otological-audiological clinics; educational audiology evaluations; generation of medical-educational-audiological profiles; long-range adjustments in therapeutic and educational programs; educational-audiological services in supervised, graded, demonstration classes.
Duration: June 1967-May 1969.
Investigator(s): Samuel G. Fletcher, Ph.D., Professor and Head, Department of Audiology-Speech Pathology, Utah State University, Logan, Utah 84321.
Cooperating group(s): Public Health Service, U. S. Department of Health, Education, and Welfare.

22-QH-3 STUDY OF MULTIHANDICAPPED BLIND CHILDREN IN CALIFORNIA

Purpose: To ascertain the number, nature, extent, and location of multihandicapped blind children in California; to determine their educational needs, provide a complete program of educational and ancillary services for them, and to determine staff requirements for such programs.
Subjects: Children under 21 defined as visually handicapped with other marked handicaps and who for reason of their combinations of handicaps cannot or should not be admitted to, and cannot profit satisfactorily from, classes provided for blind, mentally retarded, or other handicapped children.
Methods: Questionnaires; consultations with educators and administrators in the field of special education, with parents, parent representatives, and medical authorities.
Duration: November 1967-May 1968.
Investigator(s): Berthold Lowenfeld, Ph.D., Consultant in Education and Psychology (Blindness), 2928 Avalon Ave., Berkeley, Calif. 94705.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Report to be submitted in May 1968 to the Division of Special Schools and Services, State Department of Education, Sacramento.

SOCIAL SERVICES

22-RD-1 A STUDY OF THE RELATIONSHIP BETWEEN PARENTS' MARITAL ADJUSTMENT AND THEIR ACCEPTANCE OF ADOPTED CHILDREN OF ETHNICALLY DIFFERENT BACKGROUND

Purpose: To investigate relationships between parental acceptance of adopted children, adoptive parents' marital adjustment, religiosity, and certain family characteristics in cases where the adopted child is of an ethnically different background.
Subjects: 129 parents of 168 adopted children born in the United States or the Far East of racially mixed parentage.
Methods: Porter Parental Acceptance Scale, a modified short marital adjustment scale originally developed by H.J. Locke and others, Warner's Index of Status Characteristics, correlation analysis, the t test, analysis of variance, chi-square test, and critical ratio test are applied to data derived from an anonymous mail questionnaire.
Findings: A moderate positive relationship exists between adoptive fathers' marital adjustment and their acceptance of adopted children, but there is no relationship between the two variables for adoptive mothers. Parents are satisfied with their adopted children who are likely to inherit their fathers' social status. Majority of the sample indicate an approval of interracial or intercountry adoption.
Duration: March 1962-June 1967.
Investigator(s): Chae S. Sone, Ph.D., Reference Librarian, Hicksville Public Library, Hicksville, N. Y.
Cooperating group(s): Board of Trustees, Welcome House (an adoption agency).
Publications: Plan to submit to Journal of Marriage and the Family and Journal of Home Economics.

22-RE-1 A REVIEW OF THE COMPARATIVE OUTCOMES OF SERVICES RENDERED BY FOSTER PARENTS ENGAGED IN LONG-TERM FOSTER CARE: MATCHED AND UNMATCHED PLACEMENTS, 1960-1965

Purpose: To explore in detail some aspects of the home study process and possible factors affecting home study outcomes; to ascertain the possible relationship between foster parent preferences for specific characteristics in a child, agency matching or not matching these preferences, and outcomes two years after initial placements.
Subjects: Random sample of foster home studies of 150 applicant families, January 1960 to December 1965; random sample of placements involving 47 foster families and 61 foster children, January 1960 to December 1963.
Methods: Case records provided primary source of data. Foster homes studied were sampled at random and results noted on schedules designed for this purpose. Some casework staff were interviewed.
Findings: Suitable foster parents are difficult to recruit, with high loss occurring between approval for and entrance into home study. Greater durability of placement occurs when foster parent preferences are elicited and discussed prior to placement and accommodated where feasible. Caseworker judgment appears to be a major factor in home study outcomes. There was a positive relationship between homes that failed (served less than two years) and lack of adequate information

about foster parent preferences. Of the homes that failed, most had been given a favorable evaluation by home study workers. These two findings suggest the need for greater skill and/or training on the part of home study workers.
Duration: February 1966-June 1967.
Investigator(s): Herbert C. Boykin, M.S., Director, Foster Family Boarding Home Division, St. Vincent's Hall, Inc., 130 Clinton St., Brooklyn, N. Y. 11201.
Cooperating group(s): Sheltering Arms Children's Service, 122 E. 29th St., New York, N. Y. 10016.
Publications: Mimeographed copies of report available from Sheltering Arms Children's Service.

22-RE-2 FOSTER CARE AGENCY CASELOAD STUDY

Purpose: To determine the services provided by five child placement agencies to children in care and their families, and to assess the adequacy of the services in relation to the needs of the foster children.
Subjects: The whole caseload of three agencies and a 50 percent random sample of two others, all as of July 1, 1967.
Methods: Data on family history, family situation at the present time, services provided during a two-year period, and services needed are collected by each caseworker on schedules developed by the Health and Welfare Council. Data will be processed by IBM and analyzed.
Duration: July 1967-April 1968.
Investigator(s): Marie E. Costello, D.S.W., Senior Research Associate, Health and Welfare Council, Inc., 1617 John F. Kennedy Blvd., Philadelphia, Pa. 19103.
Cooperating group(s): Association for Jewish Children; Catholic Social Services; Inter-Church Child Care Society; Lutheran Children's Bureau; Children's Center of the Episcopal Church; Loeb Fund, Philadelphia Foundation, Philadelphia.
Publications: Publication planned.

22-RE-3 PSYCHOLOGICAL CHARACTERISTICS OF FOSTER CHILDREN AND FOSTER PARENTS

Purpose: To study the behavior of foster children and foster parents in light of measures, experimental methods, and findings of basic psychological science; to form a bridge between this science and child welfare practices.
Subjects: Foster children and foster parents on rolls of Child Welfare Board of Portage County, Ohio; non-foster controls matched for age, sex, race, and grade level.
Methods: Children are tested on a marble-dropping task to determine relationship between social deprivation due to foster placement and responsiveness to adult social reinforcement. Expressions of n Affiliation on TAT productions by the children are related to their status as foster children and their responsiveness to the social reinforcement. A new phase will focus on placement in a new foster home as a crisis. The PARI and a child behavior rating scale will be administered immediately after placement and some time later to determine relationship between certain parent attitudes and time and degree of adjustment.
Findings: Foster children appear to be more responsive to adult social reinforcements than their non-foster peers and show a higher degree of n Affiliation. The two dependent measures appear to be positively related.

Duration: March 1967-1969.
Investigator(s): Jeanette M. Reuter, Ph.D., Assistant Professor of Psychology, and Caroline T. Toepfer, Ph.D. Candidate, Kent State University, Kent, Ohio 44240.
Cooperating group(s): National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Publication planned.

22-RE-4 LONG-TERM FOSTER CARE: ITS POTENTIAL FOR CHILDREN

Purpose: To analyze the results of the Five-Year Project on Foster Care carried out by the Spence-Chapin Adoption Service of New York City, August 1962-August 1967.
Subjects: All 1,211 children and 474 foster families accepted into the Project; entire casework staff.
Methods: Schedules were used for foster children, foster parents, and staff. A 10 percent sample of parents and students was interviewed as well as key persons in the community and the Agency's supervisory staff and board members. Schedules were filled out by workers and supervisors. Judgments regarding qualitative terms used in the schedules were standardized by means of discussion of the entire staff engaged in the Project until a consensus was reached as to meaning and application.
Findings: Ninety-seven percent of the children made good and average progress in their foster homes in spite of the fact that many came to these homes with emotional, medical, and environmental problems. Transfers from one foster home to another were required for only 16 percent of the children.
Duration: May 1966-December 1967.
Investigator(s): Bernice Madison, Ph.D., Professor of Social Work, San Francisco State College; and Michael Schapiro, M.A., Children's Home Society of California, San Francisco, Calif. 94132.
Publications: Three articles planned for Child Welfare, 1968; Spence-Chapin is considering publishing a book after additional work is done to place the Project in a national framework.

22-RF-1 DAY CARE NEEDS IN CHICAGO

Purpose: To survey resources and estimate needs for day care services for children in Chicago on a neighborhood-by-neighborhood basis.
Subjects: 75 community areas of Chicago.
Methods: A survey was conducted to provide a descriptive inventory of existing day care resources with spot maps. Relative day care needs were estimated through indicators derived from Census figures and related measures, and national survey findings relative to day care arrangements were applied to local populations.
Duration: July 1966-July 1967.
Investigator(s): Naomi Kroeger, M.A., Research Associate, Welfare Council of Metropolitan Chicago, 123 W. Madison St., Chicago, Ill. 60091. (Reported by Sidney E. Zimbalist, Research Director, Welfare Council of Metropolitan Chicago.)
Publications: Report available from Welfare Council of Metropolitan Chicago.

22-RJ-1 A STUDY OF THE EFFECTS OF FAMILY LIFE EDUCATION SERVICES: VARIATIONS ACCORDING TO SOCIO-ECONOMIC STATUS AND INTENSITY OF INVOLVEMENT

Purpose: To evaluate effects of observation nursery schools and other mental health services on mental health, cognitive abilities, and achievement of children, and mental health and attitudes of mothers.
Subjects: 100 low income families and 100 middle class families; control groups.
Methods: Service is provided for one year. Children are studied prior to and immediately after taking part in the program, and at yearly intervals for five years. Evaluation is based upon psychological tests of cognitive, psychomotor, and verbal abilities, mothers' reports of children's symptoms, and children's performance and attendance at school. Mothers who engage in weekly discussion groups during the one-year period will be evaluated by the Hereford Attitude Scale and the Langner Scale, which measures functional symptoms.
Duration: October 1967-June 1972.
Investigator(s): R. H. Prince, M.D., Research Director, Mental Hygiene Institute, and Assistant Professor of Psychiatry, McGill University, Montreal, Quebec, Canada.
Cooperating group(s): National Council of Jewish Women.
Publications: Publication is planned; reports will be available from Dr. Prince.

22-RL-1 TIME-LIMITED PROGRAMS OF CRISIS INTERVENTION

Purpose: To explore and describe family service agencies and child psychiatric clinics that offer time-limited, crisis-oriented services.
Subjects: Approximately 100 family agencies and clinics, including approximately 1,600 cases.
Methods: Two study instruments are used: a general program questionnaire and case schedules. Emphasis is on the analysis of the planned use of the time dimension as well as a study of styles of crisis intervention.
Duration: 1965-1968.
Investigator(s): Howard J. Parad, D.S.W., Dean, Smith College School for Social Work, Northampton, Mass. 01060.
Cooperating group(s): American Association of Psychiatric Clinics for Children; Family Service Association of America.
Publications: Plan to publish monograph.

HEALTH SERVICES

22-SA-1 STUDY OF HOSPITALIZATION OF YOUNG HAIFA CHILDREN

Purpose: To assess factors predisposing the need for hospitalization; to identify prospective candidates for hospitalization as a step toward reducing the need for it.
Subjects: 5,000 newborns in Haifa, Israel.
Methods: Hospitalization records are studied to identify high-risk children and their families. Preventive services concentrating on this group may materially reduce the amount of hospital care required.
Duration: July 1966-July 1969.
Investigator(s): Dr. Simon T. Winter, Director of Pediatric Department, and Dr. William Mainzer, Honorary Research Associate in Obstetrics, Rothschild Hospital, Haifa, Israel.
Cooperating group(s): Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.

22-SA-2 PKU SCREENING IN THE STATE OF WASHINGTON

Purpose: To evaluate changes in PKU screening practices on newborns in the State of Washington over a three-year period.
Subjects: Infants born in hospitals with obstetric facilities.
Methods: Questionnaires to determine: type of test performed and laboratory used for analysis; when testing program was started; hospital policies regarding timing of test and reporting of results to physician and parents; number of newborns discharged and number of newborns tested during 1965, first six months of 1966, and first six months of 1967.
Findings: During 1965 46 percent of newborns in the State of Washington had a test for serum phenylalanine before discharge from the newborn nursery; during the first six months of 1966 the number increased to 60 percent so tested. Wide local variations in screening practice were found. Changes following community education and passage of a "permissive" PKU law in early 1967 will be evaluated by comparison with earlier survey results.
Duration: 1966-Fall 1967.
Investigator(s): Vanja A. Holm, M.D., Instructor of Pediatrics, Division of Child Health, University of Washington, Seattle, Wash. 98105. (Reported by Margaret A. Ohlson, Ph.D., Research Coordinator, Division of Child Health.)
Cooperating group(s): Washington Association for Retarded Children; Washington State Medical Association; Washington State Department of Health.
Publications: 1965-1966 results available as a report from the PKU Subcommittee of the Maternal and Child Health Committee, Washington State Medical Association, 444 N.E. Ravenna Blvd., Seattle, Wash. 98105. Results of the final survey will be submitted to a professional journal.

22-SB-1 SCHOOL HEALTH INTENSIVE REFERRAL PROGRAM

Purpose: To demonstrate the value of intensive follow-up by school nurses for correction of defects in school children.
Subjects: Public school children with known ailments or defects, and their parents.
Methods: Intensive follow-up by nurses in contacting parents through home visits, telephone conferences, and in schools to make sure they understand the nature of their children's conditions, are encouraged to seek treatment for them, and are made aware of the medical resources available to them in the community.
Findings: There has been an increase in the number of corrections completed through this program.
Duration: October 1966-June 1968.
Investigator(s): Marie E. C. Frey, M.D., M.P.H., Director, Division of Medical Services, School District of Philadelphia, 21st and Parkway, Philadelphia, Pa. 19103.
Cooperating group(s): Division of Community Health Services, Public Health Service, U. S. Department of Health, Education, and Welfare.

22-SD-1 MATERNAL CONTACT AND PREMATURE INFANT DEVELOPMENT

Purpose: To develop and evaluate a program of in-hospital involvement of mothers in the care of low birthweight infants; to evaluate effect of this program on maternal attitudes and behavior in caring for their infants during the first year of life; to evaluate effectiveness of a program of increased maternal care and stimulation on limiting disability associated with prematurity; and to provide comparative data on developmental difficulties among prematures of differing birthweights.
Subjects: 130 premature infants weighing between 1,400 and 2,000 grams; 65 premature infants weighing between 2,001 and 2,500 grams; 145 normal infants weighing 2,501 grams or more.
Methods: Longitudinal study.
Duration: January 1965-continuing.
Investigator(s): Richard M. Silberstein, M.D., Director, and Wallace Mandell, Ph.D., Research Director, Staten Island Mental Health Society, Inc., 657 Castleton Ave., Staten Island, N. Y. 10301.
Cooperating group(s): U. S. Department of Health, Education, and Welfare.

22-SD-2 A STUDY OF THE EFFECTIVENESS OF COMPREHENSIVE PRENATAL CARE FOR PREGNANT ADOLESCENTS

Purpose: To determine whether comprehensive prenatal care is superior to routine outpatient department prenatal care for pregnant adolescents; to develop a profile of the pregnant adolescent population in the Sinai program in terms of life experiences, attitudes, family life patterns and aspirations, and attitudes towards medical and preventive care.
Subjects: All teenagers below age 18, registering for prenatal care at Sinai Hospital.
Methods: All subjects are interviewed at entry to study; mothers of subjects are interviewed separately on many of the variables covered in daughters' interviews. Subjects are allocated by blind method to either comprehensive prenatal care in Family Obstetrical Clinic, or to control program of traditional prenatal care in the obstetrical clinic.

All girls are re-interviewed six months to a year following delivery, and a follow-up evaluation is made of several variables to determine effectiveness of care received.
Duration: 1965-1969.
Investigator(s): Milton Markowitz, M.D., Director; Leon Gordis, M.D., M.P.H., Associate Director; and Frank Furstenberg, Jr., Ph.D., Social Scientist, Family Clinic, Sinai Hospital, Baltimore, Md. 21215.
Cooperating group(s): Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.
Publications: Preliminary report in progress, 1967; series of full reports planned.

22-SD-3 COMPREHENSIVE CARE OF YOUNG ADOLESCENT PARENTS AND THEIR CHILDREN

Purpose: To learn better ways of providing care to adolescent parents and their children by learning more about their needs and attitudes.
Subjects: 16- and 17-year-old mothers who become pregnant and who are cared for at the Milwaukee Children's Hospital.
Methods: Girl is examined, and if pregnancy is confirmed, her parents, and often the father of the expected child, are seen by a doctor, social worker, and nurse for formulation of a plan of care. Problems of education for the parents and care of the child are worked out while obstetrical care is being given.
Findings: Prenatal interviews with parents and grandparents can prevent many of the lapses in the infant's care and disturbed psychological state of the family that would interfere with the child's development.
Duration: February 1967-continuing.
Investigator(s): Frederic M. Blodgett, M.D., Professor of Pediatrics, and Director, and N. Otto, R.N., Director of Nursing, Maternal and Child Health Clinics, Marquette University School of Medicine, Milwaukee, Wis. 53233.
Publications: Publication planned for 1968.

22-SF-1 CHILDREN AND YOUTH PROGRAM

Purpose: To assess effects of a comprehensive health care program on children from indigent families.
Subjects: Underprivileged children from birth to adolescence.
Methods: Children are interviewed and screened. They will be given medical, dental, and social care, including preventive treatment and therapeutic management of acute and chronic illness, over a five-year period. Findings will be assessed.
Duration: July 1966-1971.
Investigator(s): Giulio J. Barbero, M.D., Professor of Pediatrics, and Arthur Lipschutz, M.D., Associate Professor of Pediatrics, Hahnemann Medical College and Hospital, Philadelphia, Pa. 19102.
Cooperating group(s): Board of Education, Departments of Welfare and Health, Philadelphia.

22-SG-1 DISTURBED CHILD-LOW INCOME FAMILY STUDY CLINIC

Purpose: To demonstrate the feasibility of a dispersed community mental health clinic; to determine the type of caseload which could be expected in response to the availability of such an institution.
Subjects: A selected group of emotionally disturbed children from families in nearby low income community; control group of non-disturbed children from same community.
Methods: Parents and individual children are interviewed; disturbed children undergo physical examinations and psychological and neurological tests. Observation is made in different situations, i.e., group relations, play therapy, classroom behavior, family relations, community relations, etc. with analysis of results from overall studies.
Duration: May 1966-April 1968.
Investigator(s): H. A. Meyersburg, M.D., Research Associate, Washington School of Psychiatry Study Clinic, 10400 Connecticut Ave., Kensington, Md. 20795.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Publication planned.

RESEARCH NOTES

CENTER FOR RESEARCH AND ADVANCED TRAINING IN DEAFNESS REHABILITATION

The Center for Research and Advanced Training in Deafness Rehabilitation was initiated at New York University under the sponsorship of the Vocational Rehabilitation Administration. The Center's program is organized around three main branches: Training, Research, and Consultation. In research, the major concern is with the field of human communication, programmatically designed for integrated studies of the multiple aspects of communication.

CHILD CARE INFORMATION CENTER

The Presbyterian Institute for Human Development, Inc. has established the Child Care Information Center. The Center will be concerned with the group care of children. Further information is available from Mr. George Perkins, Director of the Institute, Box 23309, Anchorage, Ky. 40223.

NATIONAL LABORATORY IN EARLY CHILDHOOD EDUCATION

The Office of Education, U. S. Department of Health, Education, and Welfare, has established a National Laboratory in Early Childhood Education, under which centers have been set up at seven colleges and universities. These centers will represent a diversity of philosophies and approaches to early childhood education. Research and development activities of the Laboratory will be coordinated by the Center at the University of Illinois (which is also one of the eighteen ERIC Clearinghouses referred to on the following page). Information on the National Laboratory may be obtained from Dr. J. McVicker Hunt, Director, National Coordination Center, 805 West Pennsylvania Ave., Urbana, Ill. 61801.

Poverty and Human Resources Abstracts (bimonthly), Institute of Labor and Industrial Relations, University of Michigan-Wayne State University, P. O. Box 1567, Ann Arbor, Mich. 48106. Annual subscription $40.00.
Psychological Abstracts, American Psychological Association, 1333 - 16th St., N. W., Washington, D. C. 20036.
Rehabilitation Literature, National Society for Crippled Children and Adults, 2023 W. Ogden Ave., Chicago, Ill. 60612.
Research and Study Projects Reported by FSAA Member Agencies, Family Service Association of America, 215 Park Ave. S., New York, N. Y. 10003.
Sociological Abstracts, Leo P. Chall, 225 W. 86th St., New York, N. Y. 10024.

Through the Educational Resources Information Center (formerly the Educational Research Information Center), better known as ERIC, current research and research-related information will be made available to teachers, administrators, researchers, commercial organizations, and others. ERIC also includes eighteen clearinghouses, or documentation centers, located at universities and other institutions throughout the country. Each clearinghouse will concentrate on a different subject-matter area. More complete information may be obtained by writing to the Director of ERIC, Office of Education, U. S. Department of Health, Education, and Welfare, Washington, D. C. 20202.

The Excerpta Medica Foundation, New York Academy of Medicine Building, 2 E. 103rd St., New York, N. Y. 10029, has established an abstracting service on pediatrics on a yearly subscription basis. In addition to abstracts, the Foundation can provide to subscribers, at cost, photocopies and translations of complete articles.

The Human Relations Area Files have classified cultural data on primitive and nonprimitive societies into 710 categories of human behavior. Complete sets of all files are available in 22 member institutions in the United States. For information, write to Dr. Clellan S. Ford, President, Human Relations Area Files, Yale University, New Haven, Conn. 06520.

The Minnesota Family Study Center can supply to interested scholars bibliographic information from the Inventory of Published Research in Marriage and Family Behavior. Requests for information should be addressed to the Director, Inventory of Published Research in Marriage and Family Behavior, Social Science Tower 1026, University of Minnesota, Minneapolis, Minn. 55455.

The Library of the National Society for Crippled Children and Adults has initiated a photoduplication service for persons engaged in rehabilitation research. It is available without charge to personnel in educational or research institutions and health or welfare agencies, public or private. This service hopes to provide the necessary professional literature not available in local libraries. Further information may be obtained by writing to the Librarian of the Society, 2023 W. Ogden Ave., Chicago, Ill. 60612.

The Science Information Exchange, Smithsonian Institution, 209 Madison National Bank Bldg., 1730 M St., N. W., Washington, D. C. 20036, provides to qualified investigators, on request, selected abstracts of current research supported by foundation or government grants. The Exchange covers such fields as medicine, nursing, public health, nutrition, psychology, education, anthropology, mental health, and intercultural relations.

The World Federation for Mental Health, 19 Manchester St., London W.1, England, operates a clearinghouse for research and study projects in the field of mental health.

The Library of the National Bureau for Child Welfare (Voor Kinderbescherming), Stadhouderslaan 150, The Hague, publishes abstracts of articles in the field of child welfare each month. These are in Dutch, but those familiar with the Universal Decimal System would be able to understand something about the article. The subscription rate for documentation on cards is 30 guilders (approximately $8.40).

In addition to these journals and services, many professional journals in such fields as pediatrics and mental deficiency include a section of abstracts regularly or once a year. There are also a number of indexes and abstracting journals in the medical area which occasionally refer to materials in the area of child development.

CHILDREN'S BUREAU
CLEARINGHOUSE FOR RESEARCH IN CHILD LIFE
WASHINGTON, D C. 20201

If you are currently engaged in research on children or their families, we would appreciate your cooperation in providing a short summary of your work for inclusion in the next issue of *Research Relating to Children.*

The Clearinghouse is the branch of the Children's Bureau which collects and disseminates information on current research relating to children and their families. Its purpose is to make such information available to research investigators and others concerned with research in child life.

The instructions on the third page of this form will serve as a guide for your summary. You will, of course, receive a free copy of the issue in which your study appears.

If you know of others doing research which might be of interest to the Clearinghouse, please give name(s) and address(es) below:

____

INSTRUCTIONS

Please report studies in progress (or recently completed) which:

center on children or their families in such areas as child growth and development, intelligence, personality, education, social adjustment, family life, physical and emotional disorders, etc.

concern service programs in the fields of child health, child welfare, or special education

Please *DO NOT* report:

studies already reported to the Clearinghouse

purely medical studies limited to morphology or physiology, the physical aspects of etiology, epidemiology or symptomatology of diseases or handicapping conditions, surgery, chemotherapy, antibiotics or physical therapy; biochemical or other laboratory studies; animal studies

educational studies of curriculum construction or materials, teaching methods, surveys of school facilities or needs, general school administration studies

studies already published in sources generally available in major libraries across the country

demonstration projects, unless there is a formal plan for evaluation

studies of test development, standardization, or validation, except for special groups of children such as blind or retarded

regularly collected material such as annual reports, work preparatory to writing handbooks; directories; research based on secondary sources

master's theses, unless they represent work beyond a doctorate, as in dentistry

THE CHILDREN'S BUREAU
AND ITS
CLEARINGHOUSE FOR RESEARCH IN CHILD LIFE . . . .

The Children's Bureau was established in 1912 to "investigate and report. . . . upon all matters pertaining to the welfare of children and child life among all classes of our people." From this beginning, the Bureau has extended its activities into such areas as developing standards of care for children and providing funds to States to improve conditions for children. More recently, the Bureau has established several new grants programs to support research in areas of maternal and child health and child welfare.

In keeping with the basic Act establishing the Bureau, the Clearinghouse for Research in Child Life was set up in 1948. Its function is to collect information about current research relating to children in order to make such information available for the use of investigators, administrators, program planners, and practitioners.

Investigators reporting a study to the Clearinghouse receive a free copy of the issue of *Research Relating to Children* in which their study appears. A free copy of each issue is also sent to directors of research centers and to libraries. In addition, the Clearinghouse maintains a mailing list of interested persons who receive announcements of new issues as they are published. Individuals may purchase copies from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

The Children's Bureau Clearinghouse routinely exchanges information with the Science Information Exchange of the Smithsonian Institution. This organization is very helpful in providing abstracts of research supported by federal funds and by many foundations. The major source of information, however, is the individual research investigator, whose help is essential in obtaining the most complete and up-to-date coverage possible.

FOREWORD

This Bulletin, like previous issues, includes reports of research in progress or recently completed. With the exception of the long-term research, it does not report again studies included in Bulletins 3 through 22 even though they may still be continuing. This issue, therefore, does not reflect all research relating to children in a given period but only that which was first reported to the Clearinghouse January through August 1968.

The Clearinghouse has only such information about the studies as the abstracts provide. Publication references and plans are given by some of the investigators but the Clearinghouse does not maintain bibliographic information on published reports of the studies. The reader who wishes to obtain further details about any of the projects reported should check professional journals in the appropriate field or write directly to the investigator.

For the Clearinghouse, I wish to thank those who have submitted reports on their own projects and those who have told us of other studies, and to acknowledge the valuable assistance of the Science Information Exchange, and the foundations which provide us with information about their research grants.

Clearinghouse for Research in Child Life

LONG-TERM RESEARCH

Note: The reports in this section
concern research programs which are
more or less continuous.

23-AA-1 THE CHILD RESEARCH COUNCIL

Purpose: To conduct life-span investigations of growth, development, and adaptation of healthy volunteer subjects.
Subjects: 215 healthy middle and upper-middle class volunteers from Denver, ages 1 year to 48 years.
Methods: Current operation is limited to analysis of data collected since 1930 in the areas of physical growth, roentgenographic studies of growth, nutritional intakes, health records, and selected areas of biochemical and functional development. Data are being organized on electronic tape for computer analysis. Projected activity in the coming year includes analysis and publication.
Duration: 1930-continuing.
Investigator(s): Robert W. McCammon, M.D., Director, Virginia A. Beal, M.P.H., Nutritionist, Edith Boyd, M.D., Pediatrician, Charlotte Hansman, M.D., Anthropometrist and Assistant in Roentgenology, Marion M. Maresh, M.D., Roentgenologist, Aldula Meyers, Ph.D., Hematologist, and Virginia E. Trevorrow, Ph.D., Biochemist, Child Research Council, 4200 E. Ninth Ave., Denver, Colo. 80220.
Cooperating group(s): University of Colorado Medical Center; Commonwealth Fund; National Dairy Council; Gerber Products Co.; Nutrition Foundation; Phipps Foundation; National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Reprint lists available from Dr. McCammon.

23-AA-2 ANALYSIS AND EVALUATION OF DATA FROM THE LONGITUDINAL STUDY OF CHILD HEALTH AND DEVELOPMENT BASED UPON MULTIDISCIPLINE AND PERIODIC OBSERVATIONS OF INDIVIDUAL CHILDREN FROM BIRTH TO 18 YEARS

Initiation date: 1930.
Investigator(s): Research has been discontinued, but the analyses of data and preparation of reports are being continued by individuals under the direction of Robert B. Reed, Ph.D., Professor and Head, Department of Biostatistics, Harvard School of Public Health, Boston, Mass. 02115.

23-AA-3 LONGITUDINAL STUDY OF CHILD GROWTH AND DEVELOPMENT

Purpose: Program consists of study of adult personality, adjustment, and aging processes of individuals whose health, growth, personality development, and environment have been studied since birth. It included a study of the aging processes of their parents in relation to physical and biochemical measures made earlier. It will include studies of: parental childrearing attitudes and practices of two generations in the same families; constancy of autonomic response patterns to stress from childhood to young adulthood and their relationship to psychosomatic disorders in adulthood; blood lipids in relationship to body composition and change in composition.
Investigator(s): Lester W. Sontag, M.D., Director, Fels Research Institute for the Study of Human Development, Antioch College, Yellow Springs, Ohio 45387.
Cooperating group(s): Public Health Service, U. S. Department of Health, Education, and Welfare.

23-AA-4 LONGITUDINAL CROSS-CULTURAL STUDY OF HUMAN DEVELOPMENT

Purpose: To observe the long-term effects of environment upon growth and health, that is, the influence of environmental factors upon physical and mental development, and the elucidation of their mode of action and interaction with genetic endowment.
Subjects: Several hundred males followed from prepuberty, all with four grandparents from the same limited geographical zone of southern Italy but now living in the markedly different cultures of Boston, Rome, and Palermo; other groups of 100 girls and several hundred boys in Florence, Italy and 200 girls in Boston.
Methods: Repeated medical, anthropometric, and psychological examinations together with family interviews (with evaluation of childrearing practices), nutrition, and sociocultural data.
Findings: Reported in numerous articles in American and European journals. Current work under analysis includes cross-cultural study of moral values, studies of biological age and its estimation, estimation of socioeconomic status across cultures, blood groups and temperament, and changing hemoglobin values in adolescent males. Work involving further and continuing data collection includes prediction of growth variables, cross-cultural study of creativity and its environmental determinants, a study of left-handed subjects in the relatively "permissive" and "intolerant" cultures of the United States and Italy, and an analysis of menstrual symptoms in both cultures.
Duration: 1956-1968.
Investigator(s): Harben Boutourline Young, M.D., Research Associate in Human Growth and Development, Harvard School of Public Health, Boston,

Mass. 02115; present address: Harvard Florence Research Project, Via Venezia 10, Florence, Italy.
Cooperating group(s): Grant Foundation; Wenner Gren Foundation; Olivetti Corporation; Universities of Florence, Rome, and Palermo.
Publications: Perceptual and Motor Skills 23:35-40, 1966; Bulletin of the International Epidemiological Association 12:1936, 1965; American Journal of Diseases of Children 106:568-577, 1963; papers and other articles; one book planned, another possible.

23-AA-5 BIOLOGIC AND ENVIRONMENTAL FACTORS IN CHILD DEVELOPMENT

Purpose: To investigate the relationship of biologic, genetic, and environmental factors in the parents--including events during pregnancy, labor, and delivery--to normal and abnormal development of offspring. Expected byproducts of investigation are relationships of these factors to pregnancy wastage in the form of early fetal death, perinatal mortality, infant and childhood mortality, and estimates of incidence of different types of abnormalities. In addition, detailed growth curves for children from birth to six years of age will be derived on a longitudinal basis, also estimates of illnesses and injuries in infancy and the preschool child.
Subjects: Members of the Kaiser Foundation Health Plan--a prepaid medical care program--who reside in the San Francisco-East Bay Area.
Methods: Study is of a prospective, longitudinal type for both mother and child. Observations are made on the gravidas in the Department of Obstetrics and Gynecology, and on the children in the Pediatric Department, and are supplemented by special interviews and laboratory examinations. Physicians' observations are systematized and made more uniform. Special efforts are made to obtain information on members of study who do not return to the plan for medical care.
Duration: July 1959-indefinite.
Investigator(s): Jacob Yerushalmy, Ph.D., Professor of Biostatistics, School of Public Health, University of California, Berkeley; Stephen Thomas, M.D., Director, Department of Obstetrics and Gynecology, and Edgar Schoen, M.D., Director, Department of Pediatrics, Kaiser Foundation Hospital, Oakland, Calif.
Cooperating group(s): Permanente Medical Group; Kaiser Foundation Research Institute.
Publications: Journal of Pediatrics 71:2:164-172, August 1967; Pediatrics 39:940-941, 1967; American Journal of Obstetrics and Gynecology 88:4:505-518, February 15, 1964; other articles.

23-AA-6 THE BERKELEY (CALIFORNIA) GROWTH STUDY

Purpose: A study of the mental and physical growth of normally healthy persons from birth in 1928-1929 to the present.
Subjects: 60 full-term, healthy newborns, born in Berkeley, Calif. hospitals of white, English-speaking parents, if parents were interested--a somewhat selected above-average group; 140 offspring of these subjects, age range from a few months to about 20 years, seen irregularly, but same data (appropriate for age) collected that were collected for their parents.
Methods: Tests of mental and motor development; pediatric examination; interviews at frequent intervals during growth beginning in first week of life. At all visits, inquiries made concerning current health and recent illnesses. Anthropometrics, body photographs, and skeletal

X-rays taken at most ages. Socioeconomic data available. Adult records include mental tests, physical examinations, anthropometrics, and current status interview. Studies of physical aspects of growth include analyses comparing health histories with physical growth and with skeletal maturation. Some parent-child relations in susceptibility to illness could be studied. Emotional and other personality variables studied for consistency, and in various interrelations with maternal behavior in infancy, birth histories, socioeconomic status, intellectual and physical growth.
Duration: 1928-continuing.
Investigator(s): Nancy Bayley, Ph.D., and Dorothy H. Eichorn, Ph.D., Research Psychologists, Institute of Human Development, University of California, Berkeley, Calif. 94720.
Publications: American Psychologist 23:1:1-17, 1968; Monograph of the Society for Research in Child Development 28, 1963; Growth Diagnosis. Chicago: University of Chicago Press, 1959; others.

23-AA-7 MEDFORD, OREGON BOYS' GROWTH STUDY

Purpose: To construct physical and motor growth curves of boys 7 to 18 years of age; to relate physical and motor traits to physiological maturity, physique type, sociopersonal adjustment, interests, and scholastic aptitude and achievement.
Subjects: Cross-sectional samples: 40 boys at each age 9 through 15 years; longitudinal samples: 100 boys at ages 7, 9, 12, and 15 years; tested annually to 18 years.
Methods: Construction of growth and growth acceleration needs; extent of individual differences; contrasting extreme groups on various tests; zero-order, partial, and multiple correlations; factor analysis; multiple regression equations; special studies of athletes; and profile charts of outstanding athletes.
Findings: Contained in 62 master's and doctor's theses to date.
Duration: October 1955-June 1968.
Investigator(s): H. Harrison Clarke, Ed.D., Research Professor of Physical Education, School of Health, Physical Education, and Recreation, University of Oregon, Eugene, Ore. 97403.
Cooperating group(s): Oregon State Education Department; Southern Oregon College; Office of Scientific and Scholarly Affairs, University of Oregon Graduate School; Athletic Institute, Chicago.
Publications: Series of brochures planned, to be published by Prentice-Hall, Inc., Englewood Cliffs, N. J.

23-AA-8 GROWTH OF PSYCHOPHYSIOLOGICAL PATTERNS IN INFANCY

Purpose: To investigate the origins and course of development of individual differences in neonates. (See Research Relating to Children, Bull. No. 21-AA-8.)
Subjects: Normal, healthy full-term babies, 2 to 5 days old, born at Bronx Municipal Hospital Center.
Methods: A neonatal behavioral profile established in prior studies in this laboratory will be used. This profile includes behavioral and heart rate ratings on excitation, soothing, feeding, sleep, and non-stimulus periods of observation. Neonates will be followed at two weeks, one, two, three, and four months of age to measure the stability of early-appearing traits and their relation to later behaviors.

Findings: Data will be analyzed with respect to stability of early-appearing behaviors and relationship between neonatal behavior and maternal and birth history.
Duration: 1966-continuing.
Investigator(s): Wagner H. Bridger, M.D., Associate Professor of Psychiatry, and Beverly Birns, Ph.D., Assistant Professor of Psychology, Albert Einstein College of Medicine, Yeshiva University, Bronx, N. Y. 10461.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: In Early Experience and Behavior, Grant Newton and Seymour Levine (Eds.), in press, 1968; Psychosomatic Medicine 28:316, 1966; Child Development, September 1965; others.

23-AA-9 PHILADELPHIA CENTER FOR RESEARCH IN CHILD GROWTH

Purpose: To develop standards and norms of physical growth and development of normal, healthy children of the Philadelphia area.
Subjects: White and Negro children, male and female. Data are longitudinal (usually annual), based on two major samples: birth to 7 years, and 7 to 17 years. Cephalometric (measurement of head, face, jaws) and somatometric (trunk, limbs) standards of second group (white, colored) are already available; those of first group (white only) will be within the year.
Methods: Cephalometry and somatometry. Measurements are linear, transverse, sagittal, circumferential, skin thickness (via skin calipers), X-ray films of left hand (routinely) and of upper arm or lower leg (reduced number of cases); also of head and face in norma laterales sinistra and norma faciales (roentgenographic cephalometry). Dental models are taken in most cases. Histories secured are: (1) familial in terms of ethnic background and socioeconomic status; (2) medical (illness) and dental (occlusion, dental stage, oral habits); (3) genetic, in terms of the familial occurrence of trait(s) being considered. All data may be referred to several age categories: (1) chronological age (C.A.); (2) dental or eruptive age (D.A.); (3) skeletal or biological age (S.A.). All data have been put on microfilm, coded, and stored in computer memory. (1) School Series: initially based on 600 normal, healthy white school children from five Philadelphia schools, 6 to 12 years of age (ultimately followed to 22 schools). These children have provided the core data upon which our 7- to 17-year standards are based. (2) American Negro Series: based on the semiannual study of some 500 elementary school children. These children have provided the core data upon which our 7- to 17-year standards are based. (3) Orthodontic Series: now numbering some 2,700 children from the Orthodontic Clinics of the University of Pennsylvania (2,200) and the Children's Hospital (500). All of these children have been followed through their treatment course (two to four years, average). On about 10 percent of them there are posttreatment followup studies. (4) Cleft Palate Series: in cooperation with the Children's Hospital. These data are, for the most part, single preoperative roentgenographic cephalometric, plus selected somatometry (H, W, shoulder B, chest B and D, hip B, etc.). There are some 600 such records; in about 10 percent there are followup data. (5) Cooley's Anemia Series: based on some 120 children. Measurements, X-ray films, familio-genetic histories, and therapeutic treatment. Data are longitudinal, on an annual basis. (6) Endocrine and Chromosomal Series: seen on a referral basis from Children's Hospital. Data are followup, though sporadically and irregularly so.
Investigator(s): Wilton M. Krogman, Ph.D., LL.D., Director, Philadelphia Center for Research in Child Growth, and Professor and Chairman;

and Francis E. Johnston, Ph.D., Assistant Director, The Center, and Associate Professor of Anthropology, Department of Physical Anthropology; Geoffrey F. Walker, B.D.S., Director of the Philadelphia Center for Craniofacial Biology, and Research Associate in Orthodontics, Department of Orthodontics, Division of Graduate Medicine, University of Pennsylvania, Philadelphia, Pa. 19146.
Cooperating group(s): Children's Hospital of Philadelphia; Philadelphia Board of Public Education; School System, Archdiocese of Philadelphia; National Institute for Dental Research and National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.

23-AA-10 GROWTH RESEARCH UNIT

Purpose: To gain insight into critical factors influencing growth patterns of all children by observing the growth and development of deviates, especially those with pathological diagnoses which have been medically documented.
Subjects: Children with congenital cardiac lesions, and children and adolescents with significant deviations of physical, neurological, and behavioral development.
Methods: Inspection, anthropometry, photography, X-ray of the left hand and wrist. Analysis of these basic data for current status and for growth trends.
Duration: 1929-1969.
Investigator(s): Leona M. Bayer, M.D., Cochairman, Youth Clinic, Presbyterian Medical Center, San Francisco, and Adjunct Clinical Associate Professor of Medicine, Stanford University, Palo Alto; and Saul J. Robinson, M.D., 2300 California St., San Francisco, Calif. 94115.
Cooperating group(s): Institute of Medical Sciences; Service for Developmentally Handicapped Children.
Publications: Journal of Pediatrics 62:5:631-645, May 1963; Journal of Clinical Endocrinology and Metabolism 22:1127-1129, November 1962.

23-AA-11 LONGITUDINAL STUDY OF DENTOFACIAL, SKELETAL, PHYSICAL GROWTH, AND NUTRITION OF CHILDREN

Purpose: To study the dentofacial growth of children, standards of nutrition, caries increment as related to nutrition, assessment and skeletal age as related to facial growth, variations in physique and its effect on dentofacial growth. Twins are also being studied to determine heritable traits.
Subjects: 400 children, including 40 pairs of twins, ages 3 to 18 years, who have been observed for periods of 3 to 10 years.
Methods: Cephalograms, hand, wrist, and calf X-rays, intraoral X-rays, study casts, anthropometric measurements, photographs, oral examination, and one-week food diary. Children are examined every six months until 14 years of age.
Initiation date: 1950-continuing.
Investigator(s): Bhim S. Savara, D.M.D., M.S., Professor and Chairman, Child Study Clinic, Dental School, University of Oregon, Portland, Ore. 97201.
Cooperating group(s): Oregon State Board of Dental Examiners; Tektronix Foundation, Inc.; Medical Research Foundation of Oregon; National Dairy Council; National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Growth 31, 1967; Human Biology, May 1967; Archives of Oral Biology 12, 1967; others.

23-AA-12 RADIOGRAPHIC ATLASES OF SKELETAL DEVELOPMENT

Purpose: To develop radiographic standards of skeletal development for use as reference standards for children.
Methods: Series of films of hand, elbow, shoulder, hip, knee, and foot of healthy children are used to identify the modal (moderate) rate of bone development. Revisions of the 1955 Knee Standard and the 1959 Hand Standard have been tested since 1965.
Investigator(s): S. Idell Pyle, Ph.D., Research Associate, Department of Anatomy, Western Reserve University School of Medicine, Cleveland, Ohio 44106; and William W. Greulich, Ph.D., Research Biologist, National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda, Md. 20014.
Publications: The Knee Standard is scheduled for publication in 1968.

Note: The Bulletin expects to have more current information on this study in the next issue.

23-AA-13 COLLABORATIVE STUDIES IN CEREBRAL PALSY AND OTHER NEUROLOGICAL AND SENSORY DISORDERS OF INFANCY AND CHILDHOOD

Purpose: To investigate factors and conditions affecting parents: (1) conditions of pregnancy itself, such as infections, trauma, bleeding, drugs, and progress of labor; (2) environmental factors influencing mother, such as social and economic conditions, emotional stress, and medical care; (3) biological factors in parents, such as age, parity, medical and reproductive history, and immunologic characteristics; (4) genetic background of parents. To investigate in the offspring: disorders of the nervous system of all products of conception at time of delivery or appearing during infancy or early childhood, including cerebral palsy, mental subnormality, behavioral disorders, etc. A detailed investigation of the independent variables will be directed toward the reevaluation of the effect of factors already suspected, the elucidation of the mechanism through which these factors are operative, and the discovery of factors neither presently known nor suspected.
Subjects: Approximately 8,000 live births per year from collaborating institutions for five years. Offspring followed until school age.
Methods: Analysis of pooled information collected in a uniform way in a number of medical centers throughout the country from women studied during pregnancy and from their offspring followed throughout infancy and early childhood. Intensive study of limited number of cases; less intensive study of as many damaged children and abnormal pregnancies as possible.
Initiation date: 1956-continuing.
Investigator(s): Heinz W. Berendes, M.D., National Institute of Neurological Diseases and Blindness, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda, Md. 20014. Collaborating institutions: Charity Hospital, New Orleans, La.; Johns Hopkins University School of Medicine, Baltimore, Md.; Boston Lying-In Hospital and Children's Medical Center, Boston, Mass.; University of Minnesota Medical School, Minneapolis, Minn.; Columbia-Presbyterian Medical Center and New York Medical College, New York, N. Y.; University of Buffalo, Buffalo, N. Y.; University of Oregon Medical School, Portland, Ore.; Children's Hospital of Philadelphia and Pennsylvania Hospital, Philadelphia, Pa.; Brown University, Providence, R. I.; University of Tennessee Medical School, Memphis, Tenn.; Medical College of Virginia, Richmond, Va.

Publications: Bibliography available from Dr. Berendes; in Research Methodology and Needs in Perinatal Studies, Chapters 5 and 6, S. S. Chipman, A. M. Lilienfeld, B. G. Greenberg, and J. F. Donnelly (Eds.). Springfield, Ill.: Charles C. Thomas, 1966; Summary of Progress in Collaborative Perinatal Research (A Nationwide Mother-Child Study), Public Health Service Research Profile No. 9, PHSP No. 1161, 1964.

23-AA-14 METHODS IN CHARACTER DEVELOPMENT

Purpose: To develop more effective methods in character development in cooperation with families and character-training agencies. (Character is defined in terms of three dimensions: philosophy of values, breadth of social vision, and strength of purpose.)
Subjects: Children and families throughout the United States. These are in churches, YMCA's, and schools, and participate as individual families.
Methods: The methods of development are based on action research, in which the participants cooperate with the laboratory, using methods of coscientist research. Open-ended reports on research goals constitute the basic body of research data. An analysis of these data serves as the basis for the development of new procedures and for the scientific reports which are published concerning it.
Findings: Reports have been prepared concerning hypotheses being tested in the home and character-building agencies. Most of the findings relate to the home, learning, decisionmaking, and methods for character development, plus descriptions of age-level potentials, especially for decisionmaking.
Initiation date: 1935-continuing.
Investigator(s): Ernest M. Ligon, Ph.D., Director, Leona J. Smith, Ph.D., Research Associate, and staff, Union College Character Research Project, 10 Nott Terrace, Schenectady, N. Y. 12308.
Cooperating group(s): Lilly Endowment, Inc.
Publications: Character Potential: A Record of Research; How to Stand Up for What You Believe, Herbert J. Detweiler. New York: Association Press, 1966; The Marriage Climate, Ernest M. Ligon and Leona J. Smith. St. Louis, Mo.: Bethany Press, 1963; others.

23-AA-15 LONGITUDINAL STUDIES OF CHILDREN WITH CRANIOFACIAL BIRTH DEFECTS

Purpose: To study the epidemiology, genetics, morphology, physiology, and postnatal development of congenitally deformed craniofacial structures.
Subjects: 2,000 subjects.
Methods: Most subjects were initially studied as infants. Procedures include roentgencephalometry and tomography, dental casts, photographs, and speech and hearing, psychosocial, and pediatric evaluations.
Duration: 1949-continuing.
Investigator(s): Samuel Pruzansky, D.D.S., Director, Center for Craniofacial Anomalies, University of Illinois Medical Center, Chicago, Ill. 60612.
Cooperating group(s): Illinois State Pediatric Institute; National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Multiple articles in journals of dentistry, medicine, public health, speech and hearing, psychology, and research; list of publications available from Dr. Pruzansky.

GROWTH AND DEVELOPMENT

General

23-BA-1 ASSESSMENT OF ADOLESCENT ADJUSTMENT PATTERNS

Purpose: To gain insight into basic adolescent adjustment processes, especially as they pertain to a public school setting, in order to go beyond diagnosis to provide a basis for an understanding of the psychodynamics of adolescent adjustment as well as to predict therapeutic intervention if necessary.
Subjects: High school boys and girls, ages 12 to 18, representing cumulative referrals to Psychological Services; representative samples of regular students.
Methods: Kahn Test of Symbol Arrangement used as a screening device; supportive data obtained from battery of tests including Wechsler, Bender, DAP, and WRAT.
Findings: Seventeen adjustment patterns were assessed, including two "normal" ones. The KTSA Symbol Pattern (SP) lends itself to gaining insight into the psychodynamic process of adolescent adjustment.
Duration: Fall 1967-Spring 1969.
Investigator(s): Rudolph F. Wagner, Ph.D., Chief Psychologist, Richmond Public Schools, 809 E. Marshall St., Richmond, Va. 23219.
Publications: Paper to be read at American Psychological Association meeting; reprints available from Dr. Wagner. Journal publication planned.

23-BA-2 CHILD DEVELOPMENT RESEARCH PROJECT--A FOLLOWUP STUDY

Purpose: To follow through the first year of elementary school the subjects of the Infant Development Project who have been classified as having been subjected to seven types of maternal handling geared to the first year of life, and who differ in developmental quotient and in signs of advancement and disturbance according to the type of maternal handling. Study proposes specifically to ascertain whether and how the type of maternal handling during the first year of life is related to (1) the outcome of such critical periods as weaning, toilet training, and the establishment of sexual identity for the child; (2) the way in which the parents, particularly the mother, handle these critical periods; (3) school adjustment at the end of the first year of elementary school; (4) the intelligence quotient, fantasy life, ability to conceptualize, and degree of psychological conflict in the child through the end of the first year of school.
Subjects: 130 white children of intact families, of normal birth, born at Lenox Hill Hospital in New York City; their mothers.
Methods: Children, and their parents, will be interviewed at ages two, two and one-half, three, four, five, and six, and psychological tests, including Stanford-Binet, WISC, and Children's Apperception Test administered at appropriate ages. At age six, capacity for abstract thinking will be measured, and at each age, there will be an objective assessment of mother-child interaction, using a structured situation. The adjustment of the child in nursery school, if applicable, and during the first year of elementary school will be evaluated.

Duration: November 1967-August 1973.
Investigator(s): Sylvia Brody, Ph.D., Director, Child Development Research Project, 345 E. 81st St., New York 10021; and Sidney Axelrad, D.S.Sc., Dean of Graduate Studies, Queens College, City University of New York, Flushing, N. Y. 11367.
Cooperating group(s): Grant Foundation.
Publications: Books and articles planned.

23-BA-3 STUDY OF INFANT VOCALIZATIONS

Purpose: To analyze the early cry behavior of newborn infants to detect early brain damage, genetic defects, and other disorders.
Methods: The sound spectrograph and a new method of continuous spectrography are being used to study the structure of early vocalization. Infants are studied in the newborn nursery of the Langley Porter Neuropsychiatric Institute and again at followup visits to the pediatrician or clinic. Infants are usually recorded in the presence of the mother. The development of cooing or babbling is being studied, since delays or absences in this development may indicate that the child is physically or mentally disturbed.
Duration: 1968-1969.
Investigator(s): Peter Ostwald, M.D., Psychiatrist, Langley Porter Neuropsychiatric Institute, 401 Parnassus Ave., San Francisco, Calif. 94122.

23-BA-4 RELATIONS BETWEEN HUMAN NEONATAL BEHAVIOR AND LATER DEVELOPMENT

Purpose: To locate aspects of newborn behavior and physiology and to relate these aspects to social response and vigor of reaction to environmental obstacles in later stages of development.
Methods: Galvanic skin potential (GSP) was studied in a small sample of newborns to ascertain whether spontaneous level was stable over periods of 24 hours or less. In another phase, a criterion measure of social response at four months of age was developed.
Findings: Marked differences in GSP level were found between sessions, but pattern of change during sleep could be characteristic of the individual newborn. Contrary to findings on adults, GSP showed greater variability during rapid eye movement (REM) sleep, and contrary to results on respiration and heart rate in young infants, there was no increase in GSP level during REM phases. In the study of social response, preferential visual attention increased with increases in degree of resemblance of stimuli to a human face, not with increases in complexity, thus demonstrating a transitive perceptual ordering according to a social form at four months of age.
Duration: 1967-1970.
Investigator(s): Thomas C. Douthitt, Ph.D., Research Psychologist, Section on Infant Development, and Richard Q. Bell, Ph.D., Chief, Child Research Branch, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda, Md. 20014.

23-BA-5 RELATIONS OF PRESCHOOL BEHAVIOR TO EARLIER PARENT AND CHILD CHARACTERISTICS

Purpose: To establish measures of parent and child characteristics at the preschool and early school level.
Subjects: Children for whom preparental, newborn, early infancy, and preschool data are available.

Methods: Children are observed in free play and in experimental situations in a five-week period of attendance at a research nursery school. Effort is concentrated on measurement of social development and persistence in overcoming obstacles. Intelligence and cognitive style are studied in six- and seven-year-old children who are tested in the laboratory for two hours while the mother is interviewed.
Findings: Preliminary results indicate a negative relation between suck rate and vigor of response to interruption of sucking during the newborn period, and dependency on supportive adult figures in the preschool period. In a separate sample, dependency in the preschool period has been found to be positively related to relational thinking in cognitive tasks and negatively to nonverbal intelligence near age six.
Duration: Not reported-1972.
Investigator(s): Charles F. Halverson, Jr., Ph.D., and Lawrence Harper, Ph.D., Staff Fellows, and Mary F. Waldrop, Director of Nursery School, Child Research Branch, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda, Md. 20014.

23-BA-6 AUTOMATED, SELF-REGULATED STIMULUS ENRICHMENT FOR INSTITUTIONALIZED INFANTS AND YOUNG CHILDREN

Purpose: To increase availability of reciprocal language, social, and other stimulus values for infants confined by various handicaps to restricted stimulus and behavioral environments; to investigate the effects of experimentally controlled audiovisual feedback variables upon the children's discrimination of and preference for self-selected enrichment stimuli; to investigate the effect of this form of stimulus enrichment on development.
Subjects: Presumed normal, identified retarded, and otherwise handicapped institutionalized children, ages nine months to eight years.
Methods: Automated devices are employed which allow cribbound infants to choose between pairs of audiovisual feedback stimuli by making simple operant responses on manipulanda attached to the crib. Devices permit maintenance of experimental control over any audio stimuli that can be recorded on common audiotape and any visual stimuli that can be presented by slide or movie projectors. A response register records the frequency, duration, and distribution in time of all responses, permitting the analysis of discriminative patterns of stimulus-producing behavior. Stimulus programs are adjusted to suit the level of feedback discrimination and recognition demonstrated by each child.
Findings: Normal and variously handicapped children physically capable of making minimal operant responses perform at high levels to produce audiovisual stimuli that include conversational voices, rhythmic music, and still and moving pictures of familiar and unfamiliar persons and objects. Differentiated responding among pairs of different stimuli offered simultaneously indicate discrimination of stimulus differences and demonstrated feedback preferences by children previously not believed capable of making fine-grained discriminations and behavioral differentiations. Changes in response patterns over days and weeks suggest developmental capabilities not previously noted.
Duration: September 1967-not reported.
Investigator(s): Bernard Z. Friedlander, Ph.D., Research Psychologist, Department of Rehabilitation Psychology, University of Wisconsin, Madison, Wis. 53706.
Cooperating group(s): Central Wisconsin Colony and Training School, Madison, Wis.
Publications: Preliminary report in American Journal of Mental Deficiency 71:6:909-919, 1967. Reports presented at the Society for Research in Child Development, 1967. Papers to appear in psychological and rehabilitation journals.

23-BA-7 PROGRAM IN CHILD WELFARE RESEARCH

Purpose: To study the development of disadvantaged children from early infancy to age seven in three environments--foster families, their own families, and a group residential care setting.
Subjects: Pilot group of 22 children, ages 13 months to 4-1/2 years, attending Yale University Child Study Center; neonates in biological and foster families, and a group of infants and children residing in Children's House.
Methods: Major services being provided are social work services to families, health care, and a program of day care and education for children. Study of pilot group has resulted in improvement of methods of study and delivery of services, and has helped to work out some of the problems involved in developing a well-functioning multidisciplinary research group. Longitudinal study of children will include physical health and growth, neurological, cognitive, and emotional development, and social adaptation and adjustment in family, with peers, and in the neighborhood and school.
Duration: July 1967-June 1972.
Investigator(s): Sally Provence, M.D., Director, and Audrey K. Naylor, M.S.W., Assistant Director, Yale University Child Study Center, New Haven, Conn. 06510.
Cooperating group(s): Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.

Physical

23-CB-1 CONTRIBUTORY FACTORS IN CHILDHOOD OBESITY

Purpose: To determine some of the factors contributing to obesity in children.
Subjects: 80 children in middle elementary grades.
Methods: Interviews with parents of 25 of the subjects; analysis of sociometric and socioeconomic data on all subjects. Information on 22 of the children provides the basis for an analysis and comparison of various methods for obesity assessment in middle childhood and the derivation of an equation for estimating body density in children from anthropometric measurements.
Findings: Analysis of data indicates that a prediction for body density is possible using only cheek and abdomen measurements. Validation of the prediction equation is in progress.
Duration: 1960-indefinite.
Investigator(s): Gertrude Couch, Ph.D., Wayne State University, Detroit, Mich. 48202; Queenie B. Mills, Ed.D., Willie M. Mowrer, Ph.D., and Philip O'Neill, Ph.D., Department of Home Economics, Agricultural Experiment Station, University of Illinois, Urbana, Ill.
Cooperating group(s): State of Illinois.

23-CC-1 THE DEVELOPMENT OF TOUCH AND VISION IN YOUNG CHILDREN

Purpose: To determine children's abilities to discriminate stimulus differences in shape and texture both visually and haptically; to assess the basis for dimensional preferences noted at specific ages.
Subjects: Kindergarten and third grade normally sighted children, blind elementary school children, and sighted college undergraduates.

Methods: All studies were conducted both visually and haptically, with identical procedures and stimuli. Studies designed to measure discriminative abilities used a psychophysical technique in which the children made "same-different" judgments on pairs of ellipses varying from round to elliptical and pairs of sandpaper varying from very coarse to smooth. Mean difference thresholds were calculated on the basis of each child's judgments. In the preference studies, a conflict-of-cues design was used in which the child had to discriminate between two objects differing in shape and texture. In the transfer phase, the combination of specific dimensional values was reversed, so that one could infer the dimensional basis of the original discrimination. The discriminability of the shape and texture differences (psychophysical data) was strictly controlled to assess the effect of this variable in preference.
Findings: Children improve in their ability to detect texture differences in touch but not in shape. Blind children are not significantly different from sighted third graders, nor are adults. In vision there is no age improvement in either dimension. Haptically, kindergarten children prefer to discriminate objects on the basis of texture, while third graders prefer shape. Visually, all ages prefer to use shape. When the discriminability of the differences on the preferred dimension is reduced drastically, the preference will change to the previously nonpreferred dimension which is now much more discriminable, but the difference in the discriminability of the two dimensions must be very large.
Duration: September 1966-December 1967.
Investigator(s): Anne D. Pick, Ph.D., National Institute of Child Health and Human Development Post-Doctoral Fellow, Herbert L. Pick, Jr., Ph.D., Professor of Psychology, and Cynthia Rae Gliner, Ph.D., Research Associate, Institute of Child Development, University of Minnesota, Minneapolis, Minn. 55455.

Publications: Journal of Experimental Child Psychology, article in preparation, 1967.

23-CC-2 AUDITORY AND VISUAL LEARNING OF A PAIRED ASSOCIATE TASK BY KINDERGARTEN CHILDREN

Purpose: To explore the use kindergarten children make of visual and auditory cues in a paired associate task.
Subjects: 32 kindergarten children from a middle class neighborhood; 12 children from a Head Start program.
Methods: A list of words selected from preprimers used in the New Orleans public schools and originally employed with first and second grade children was grouped together randomly to form four lists of eight word pairs each. Children were given preliminary training in the paired association situation followed by both the visual and auditory lists in counterbalanced order with approximately 30 minutes between the lists.
Findings: Kindergarten children, like first and second grade children, perform more efficiently on a paired associate task if they are using visual rather than auditory cues. These data are in agreement with other studies which indicate that by age five, children show visual dominance in a variety of perceptual tasks.
Duration: 1967-continuing.
Investigator(s): Suzanne D. Hill, Ph.D., Associate Professor of Psychology, and Sandra Loucks, Louisiana State University, Lakefront, New Orleans, La. 70122.
Publications: Paper presented at Southwestern Psychological Association Meeting, April 1968.

23-CD-1 SLEEP OF THE NEONATE

Purpose: To determine the interaction of behavior during sleep and physiological variables; to develop indices of psychological and physiological maturation; to measure effects of certain environmental variables on sleep.
Subjects: One- to five-day-old infants.
Methods: Infants are observed during sleep, and polygraph recordings are made of eye movement, respiration, heart rate, and EEG.
Findings: Clear-cut interaction of behavior and physiological variables provides some justification for using either alone. Age and noise seem to change sleep in selective ways.
Duration: 1966-1971.
Investigator(s): James G. Minard, Ph.D., Research Psychologist, and Assistant Professor, and Donald Coleman, M.D., Psychiatrist, and Assistant Professor, Western Psychiatric Institute and Clinic of the University of Pittsburgh, 3811 O'Hara St., Pittsburgh, Pa. 15213.
Cooperating group(s): Magee-Womens Hospital.
Publications: Psychophysiology, in press, 1968.

23-CG-1 AN INVESTIGATION OF SELECTED FOOT PREFERENCE TESTS WITH FIRST GRADE BOYS AND GIRLS

Purpose: To determine whether various types of foot preference exist, and if so, what they are.
Subjects: 36 boys and 19 girls in first grade in Bellevue, Wash.
Methods: Nine foot preference tests, grouped according to purposes such as support, manipulation, takeoff, etc., were administered twice and data analyzed to determine consistency of foot usage with each task and to compare foot usage for various tasks. Comparison was made of number and percent of boys, girls, and total group who used same or opposite foot for two trials of task and who used same, opposite, or showed no preference for one of tasks.
Findings: Foot preference appears to be specific to task, although boys and girls tend to use the same foot for kicking as for hopping. As the height of the step in the step-up test increases, an increase in foot preference appears to be indicated. Subjects did not show a preference for a certain foot for various tasks involving support of body weight. Boys seem to show a preference for manipulative tasks.
Duration: Not reported.
Investigator(s): Marion R. Broer, Ph.D., Professor of Physical Education, University of Washington, Seattle, Wash. 98105.
Publications: Publication planned.

23-CH-1 A STUDY OF BEHAVIORAL COMPONENTS OF STUTTERED SPEECH

Purpose: To determine whether patterns in the visible and audible features of stuttered speech may provide a basis for the classification of different subgroups of stutterers and cues for evaluating those characteristics of speech which become altered as a consequence of therapy.
Subjects: 20-30 boys and young men, ages 15 to 21, who are stutterers.
Methods: Sound motion pictures were taken of subjects prior to and at the completion of an eight-week residential therapy program. Films will be analyzed at regular and frame-by-frame speeds so that the visible and audible characteristics of stuttering may be described and compared with each other.

Duration: May 1967-June 1968.
Investigator(s): David Prins, Ph.D., Associate Professor and Director, University of Michigan Speech and Hearing Camp, Ann Arbor, Mich. 48104.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Results will be published in a final research report and presented at professional meetings and in professional journals.

Intellectual

23-DA-1 SOCIAL REINFORCEMENT AND ANXIETY IN CHILDREN

Purpose: To study the effects of test anxiety, success-failure experiences in pretraining, and social reinforcement versus nonreinforcement on the level of aspiration of middle elementary school age children.
Subjects: 62 boys and 70 girls comprising the third and fourth grades of a suburban school system of Champaign-Urbana, Ill.
Methods: Sample was administered the Test Anxiety Scale for Children (TASC) approximately two weeks before experimental testing. Twenty-four children of each sex above and below median TASC score were tested experimentally. An equal number of children of each sex and TASC level were exposed to one of three pretraining experiences: success at easy puzzles, failure at difficult puzzles, or no evaluative experiences. In the experimental session subjects estimated their level of achievement compared to other children before and after they performed at an angle-matching task at which they could not evaluate their performance, while the male experimenter was either supportive or nonresponsive.
Findings: Success in pretraining raised and failure in pretraining lowered subjects' initial level of aspiration compared to children in the control condition. Level of aspiration did not change if experimenter was nonresponsive during the task. Level of aspiration increased when experimenter was supportive and more so for girls than boys.
Duration: June 1967-June 1970.
Investigator(s): Kennedy T. Hill, Ph.D., Assistant Professor of Psychology, University of Illinois, Urbana, Ill. 61801.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: To be submitted to a psychology journal in 1968.

23-DA-2 A STUDY OF INTELLECTUAL GROWTH AND VOCATIONAL DEVELOPMENT

Purpose: To trace the intellectual development of high school students who subsequently elect vocational as opposed to college preparatory curricula; to investigate the interaction over time of stated vocational plans, individual characteristics, environmental influences, and subsequent occupation; to develop a preliminary theoretical model of vocational development.
Subjects: 40,000 students.
Methods: A study of vocational orientation and preparation of American youth is being conducted using data from the "Study of Academic Prediction and Growth," a longitudinal study initiated in 1961. (See Research Relating to Children, Bull. No. 18-0-3.) Current project will supplement several batteries of test data from that investigation. Questionnaires and interview instruments are developed and administered to the same student population whenever possible. Followup questionnaire is given to those students who graduated during the time of the project.

Duration: Not reported-October 1968.
Investigator(s): Thomas L. Hilton, Ph.D., Senior Research Psychologist, Educational Testing Service, Princeton, N. J. 08540.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

23-DB-1 EARLY ENVIRONMENTAL INFLUENCES ON COGNITIVE AND PERSONALITY DEVELOPMENT IN INFANCY

Purpose: To identify some of the possible early antecedents of the cognitive deficits and personality disturbances commonly found in children from low socioeconomic backgrounds.
Subjects: 80 infants from economically disadvantaged homes; middle class control group.
Methods: Relationships between specific dimensions of the early environment and specified aspects of development in infancy are examined. Data on patterns of stimulation and of maternal care of infants in first year of life are obtained from repeated observations in naturalistic situations in the home. Assessment of the infant is based on observations in structured settings, in which several procedures are administered.
Duration: Not reported-July 1969.
Investigator(s): Leon J. Yarrow, Ph.D., Chief, Judith Rubenstein, Ph.D., Frank A. Pedersen, Ph.D., and Joseph J. Jankowski, M.D., Staff Members, Social and Behavioral Sciences Branch, National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda, Md. 20014.

23-DB-2 LEARNING AND MOTIVATION AS A FUNCTION OF SOCIOECONOMIC LEVEL

Purpose: To determine the existence of different abilities to form abstractions; to identify those children who have cognitive defects and who need remedial training; to identify at an early age those children who will be most likely to require rewards more tangible and different from those offered in the usual classroom setting; to develop remedial programs to repair deficits in cognitive functioning as early as possible; to significantly reduce the downward spiraling of cognitive efficiency; to accumulate longitudinal data on the development of cognitive abilities.
Subjects: 800 children, ages four to seven, 200 in each group, drawn at random from high and low socioeconomic level populations as determined from two sets of specially selected census tracts in Atlanta.
Methods: Each subject is tested with two related but separate procedures. (1) Reward preference: each child is presented, at two different sessions, with a basket of eight various reward items from which he will be asked to select some and discard others. (2) Concept formation with high and low reward: on the basis of the reward preference results, one-half of the two socioeconomic groups will be assigned to the high or low reward groups. Each child will be given four tasks. One of the two-choice tasks will utilize stimulus figures which may be considered to be related to educational concepts, and the other will utilize universally known figures. The four-choice problems will be analogously educational or noneducational.
Duration: September 1965-August 1968.
Investigator(s): Irwin J. Knopf, Ph.D., Professor and Chairman, and Martin M. Shapiro, Ph.D., Associate Professor, Department of Psychology, Emory University, Atlanta, Ga. 30322.
Cooperating group(s): U. S. Office of Economic Opportunity.
Publications: To be submitted to psychological journals.

BEST COPY AVAILABLE

23-DB-3 AIDING COGNITIVE GROWTH IN DISADVANTAGED PRESCHOOLERS

Purpose: To explore the effect on cognitive growth of socially disadvantaged preschool children of a compensatory intervention program in which the principal agent is ultimately the child's own mother.
Subjects: 64 lower class children, ages 20 to 43 months, living in a low income, predominantly Negro housing project in two different parts of Long Island; their mothers: 34 experimental and 30 control dyads.
Methods: All subjects are interviewed for background variables. Children are pretested with the Peabody Picture Vocabulary Test and the Cattell and Binet Intelligence Scales; mothers are given an experimental self-attitude rating scale. Experimental group is then exposed to verbally oriented play activity within the mother-child dyad for six months; activity is focused around selected toys and books and stimulated by regular visits by social workers. During this period, one-half of the control group receives "placebo" intervention in order to offset the "Hawthorne effect"; the remaining controls receive no intervention. All subjects are then retested with instruments used prior to six-month period, and the results are compared to determine the optimum "critical period" for intervention. In second year of study social workers were replaced by two kinds of nonprofessionals, paid aides (current experimental mothers) and volunteers.
Findings: Initial results indicate quantitative and qualitative evidence of increased verbal interaction in experimental dyads.
Duration: March 1967-June 1970.
Investigator(s): Phyllis Levenstein, M.S.S.W. (Ed.D. Candidate, Teachers College, Columbia University), Consulting Psychologist, and Robert M. Sunley, M.S.W., Assistant Director, Family Service Association of Nassau County, 286 Old Country Rd., Mineola, N. Y. 11501.

Publications: *American Journal of Orthopsychiatry* 38:116-121, January 1968.

23-DB-4 COGNITIVE SYNTHESIS IN NEGRO AND WHITE CHILDREN

Purpose: To experimentally analyze the ability to integrate information when "triggered" by symbolic cues in three kinds of situations: verbal--integrating actions with logographs (whole word symbols), maplike--integrating spatial ideas, and mathematical.
Subjects: 212 Negro and white children, ages four to nine.
Methods: A normative study was made of effects of age, sex, race, and socioeconomic status on the three kinds of synthesis. A training study, utilizing Negro ghetto children only, assessed effects of four training conditions on verbal synthesis in five-year-olds; three training conditions on maplike synthesis in seven-year-olds; and two training conditions on mathematical (ordering) synthesis in four-year-olds. Only one of the verbal training conditions (overlearning both actions and word symbols) significantly passed performance of its control group and normative group. Currently, an attempt is being made to utilize the same training style (overlearning of actions and symbols) on maplike and mathematical synthesis tasks with Negro and white children.
Findings: In general, Negro children, as compared to white children, have special difficulty with spatial and mathematical information, but are superior in verbal-action synthesis. This may be the best pathway to cognitive training.
Duration: 1966-1968.
Investigator(s): Sylvia Farnham-Diggory, Ph.D., Assistant Professor of Psychology, Carnegie-Mellon University, Pittsburgh, Pa. 15213.

Cooperating group(s): Maurice Falk Medical Fund; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Paper to be submitted to Monographs of the Society for Research in Child Development by December 1968, if possible. Multilith preprints available from Department of Psychology, Carnegie-Mellon University.

23-DB-5 PATTERNS OF PERCEPTUAL, LANGUAGE, AND INTELLECTIVE PERFORMANCE IN CHILDREN WITH COGNITIVE DEFICITS

Purpose: To study the perception, language ability, and intellectual performance of children who have learning problems; to draw implications for special education for these children and for indicating minimal brain damage among them.
Subjects: First grade children from socially marginal backgrounds: one-half had participated in a preschool program emphasizing perceptual and language training, while the other half had no preschool experience.
Methods: The Verbal Identification Test, Socioeconomic Status Index, Cloze Test, Kendler Technique, and visual, auditory, and tactile masking tests were administered to subjects, and a behavior evaluation made. Performance patterns were related to school achievement at completion of first and second grades.
Duration: Completed.
Investigator(s): Cynthia P. Deutsch, Ph.D., Senior Research Scientist, Institute for Developmental Studies, New York University School of Education, New York, N. Y. 10003.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Final report in preparation, 1968.

23-DC-1 RETARDATION IN INTELLECTUAL DEVELOPMENT OF LOWER CLASS PUERTO RICAN CHILDREN IN NEW YORK

Purpose: To identify detrimental behavioral and intellectual patterns which retard learning; to determine those environmental factors which contribute to detrimental growth patterns as well as those which can be used to promote intellectual functioning.
Subjects: 250 disadvantaged Puerto Rican children in New York City; control group of advantaged middle class children.
Methods: Annual home visits and parent interviews provide data on characteristics of intrafamilial environment, childcare practices, written and spoken language usage, bilinguality, types of play material, parental aspirations and activities, and special environmental stresses and incidents. Information on each child's behavioral and perceptual patterns, levels of intellectual functioning and academic achievement, and cognitive style characteristics are obtained through various psychological test procedures and a teacher evaluation rating scale. Study variables are quantified through rating scale and item scoring procedures, and norms for each variable established and compared with those of the control population.
Duration: Not reported-May 1969.
Investigator(s): Alexander Thomas, M.D., Professor, Department of Psychiatry, New York University Medical Center, New York, N. Y. 10016.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

23-DC-2 STRUCTURE OF INTELLECT DETERMINANTS OF CONSERVATION

Purpose: To compare the factor structure of children at the preoperational level of thinking with that of children at the concrete-logical operations stage as exemplified by their attainment of conservation of quantity ability; to identify emergent intellectual processes at the four- to seven-year-old level.
Subjects: 200 six- and seven-year-old children; 200 four- and five-year-old children.
Methods: Hypotheses were developed regarding factors relating to conservation and those not expected to relate to conservation. A test battery was constructed and administered individually to the children, and data will be statistically analyzed and interpreted.
Duration: June 1967-June 1969.
Investigator(s): Russel E. Orpet, Ed.D., Professor of Educational Psychology, California State College, Long Beach, Calif. 90804.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.

23-DC-3 DEVELOPMENT IN SYSTEMATIZATION OF THINKING

Purpose: To establish norms and ranges in standardized form and growth curves for a large battery of Piagetian items; to establish the amount of learning in each subtest resulting from practice and prompting; and to lay the basis for experimental studies of development in learning.
Subjects: 200 children, ages 5 to 10.
Methods: A battery of 21 tests, each comprising several subtests, is administered. Sample will be extended to 1,000 next year. Longitudinal and experimental studies will follow, using these norms as reference points.
Duration: February 1968-December 1969.
Investigator(s): E. A. Lunzer, Ph.D., Senior Lecturer, Department of Education, University of Manchester, Manchester 13, England.
Cooperating group(s): Colleges of Education and heads of primary schools.
Publications: Future publication planned.

23-DC-4 INVESTIGATION OF DIAGNOSTIC AND TREATMENT METHODS FOR SCHOOL CHILDREN WITH LEARNING DISABILITIES

Purpose: To assess the diagnostic value of medical, neurological, and psychological examinations in identifying school children with learning disabilities, and to observe results of individual remedial teaching; to evaluate the efficiency of certain psychological tests in identifying children with learning disabilities at grade two level, ages seven to nine.
Subjects: 41 children, ages 7 to 11, in two schools, referred by teachers, and controls; 165 children from 13 schools in grade two.
Methods: First group of children were given medical, neurological, and psychological examinations, WISC, Frostig, Percepto-Diagnostic, Reading tests, and ITPA. First 12 boys identified as having learning disabilities were given individual remedial teaching one-half hour daily in school. Controls were given same assessment, but no remedial teaching. Reassessment of WISC and reading tests was done at the end of the second year. All children in grade two who had repeated a grade, a random sample of those scoring low on the Metropolitan Achievement test, and a random sample of those achieving adequately were tested with WISC, Frostig, Wepman, and ITPA.
Findings: No single examination is adequate for diagnosis of learning disabilities. Children in remedial teaching group have improved more than controls, though not markedly in two years. Other variables, such

as home background, must be taken into account. Psychological tests alone will not discriminate between achievers and nonachievers at grade two level; some of the achievers scored low on various tests.
Duration: April 1966-March 1968.
Investigator(s): Ruth McDougall, M.D., D.P.H., Associate Professor, Department of Preventive Medicine, Dalhousie University, Halifax, Nova Scotia; present address: c/o CUSO Field Officer, P.O. Box 30748, Nairobi, Kenya, East Africa; and Barbara Archibald, M.A., Psychologist, 6 Highland Pl., Wolfville, Nova Scotia, (formerly) Research Fellow, Dalhousie University.
Cooperating group(s): Junior League of Halifax; City of Halifax School Department; Department of National Health and Welfare of Canada.
Publications: Publication planned; reports to be submitted to Research Development Section, Department of National Health and Welfare, Ottawa.

23-DC-5 RESPONSE TO VARYING LEVELS OF CONDITIONING REWARDS

Purpose: To study the means of establishing and strengthening certain positive reinforcers that may be used in teaching situations; specifically, to test hypotheses based on the principles of conditioned reinforcement and on the assumption that there is a hierarchical order of reinforcement.
Subjects: Children, ages 5 to 6-1/2, who are responsive to particular reinforcers.
Methods: Subjects took part in two experimental sessions to determine who was conditioned to approval and who was conditioned to confirmation. Each group was then tested to establish the effectiveness of newly determined reinforcers; those children who had been conditioned to use self-reinforcement were then tested by observing how well they learned from a programmed self-instructional lesson.
Duration: Not reported-June 1968.
Investigator(s): Robert E. Silverman, Ph.D., Professor and Chairman, Department of Psychology, University College of Arts and Science, New York University, Bronx, N. Y. 10453.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

23-DC-6 VERBAL DISCRIMINATION IN CHILDREN

Purpose: To investigate developmental trends in both intentional and incidental learning components of verbal discrimination tasks.
Subjects: Fourth, sixth, and eighth grade students, 24 in each grade, and 12 of each sex, from middle class grade schools.
Methods: Standard verbal learning procedures.
Findings: Covariation between intentional and incidental learning performance interacts with grade level.
Duration: 1967-November 1968.
Investigator(s): Donald H. Kausler, Ph.D., Professor and Chairman, Department of Psychology, St. Louis University, St. Louis, Mo. 63103.
Publications: To be submitted to Journal of Experimental Child Psychology.

23-DC-7 CURIOSITY BEHAVIOR OF NEGRO, MEXICAN-AMERICAN, AND WHITE LOWER CLASS FOUR- AND FIVE-YEAR-OLD CHILDREN

Purpose: To compare curiosity behavior among these three groups of children as part of an eventual aim of describing different modes of

curiosity behavior among different groups of children and relating these to the curiosity approach in curriculum planning.
Subjects: 30 Negro, 30 Mexican-American, and 30 white lower class children.
Methods: Visual curiosity is rated by the differential attention paid by the child to more and less complex and unusual stimuli. Behavioral curiosity rating consists of behavioral observation of (1) passive attention, (2) active manipulation of usual elements of stimulus objects, and (3) active manipulation and experimentation with unusual elements of stimulus objects. Verbal curiosity is rated by the number and type of questions asked in a free play situation with an adult.
Duration: February 1967-May 1968.
Investigator(s): Alfred A. Lucco, Ph.D., Assistant Professor, University of California, Berkeley, Calif. 94720.
Cooperating group(s): Office of Research, University of California, Berkeley; Oakland Economic Opportunity Council; Merced County Superintendent's Office.

23-DC-8 MEMORY AND MENTAL IMAGERY IN YOUNG CHILDREN

Purpose: To replicate results reported by Piaget; to evaluate memory and mental imagery in retardates and economically deprived children.
Subjects: Nursery, kindergarten, and elementary school children up to age seven, from middle class and deprived environments; retardates matched for mental age.
Methods: Subjects are shown a set of sticks arranged in descending order. One week later and six months later, they are asked to reproduce the array. They then are asked to make the design with a comparable set of sticks, and finally, to pick the right design from four arrays.
Findings: Preliminary data indicate possible support of Piaget's position.
Duration: Fall 1967-Spring 1969.
Investigator(s): Mortimer Garrison, Jr., Ph.D., Professor of Psychology, College of Education, Temple University, Philadelphia, Pa. 19122.
Publications: Preliminary report presented at American Association on Mental Deficiency Meeting, Boston, 1968.

23-DC-9 RECONSTITUTIVE MEMORY IN KINDERGARTEN CHILDREN

Purpose: To investigate effects of time of reward and certainty of reward on reconstitutive memory; to replicate Piaget's finding of an improvement in such memory over a six-month period.
Subjects: Public school kindergarten children in Moorhead, Minn., assigned to a no-reward or reward condition. No within-classroom assignments were made to reward and no-reward conditions, or to immediate or one-week testing.
Methods: Subjects inspected 10 bars arranged in serial order for a two-minute inspection period. Immediately after inspection or one week later subjects were asked to reproduce the original display (test of memory). Some children were offered no reward, some were guaranteed a reward on completion of the reproduction, and for some, reward was contingent on accurate reproduction of the original display. Reward subjects were offered the reward either before inspection of the display or before reproduction of it. All children were encouraged to reproduce the original display as accurately as possible, and no child inspected the display after the original two-minute inspection period. All no-reward

subjects tested one week after inspection of the display who were still available after six months reproduced the display again at that time. The frequency of correctly placed bars constituted child's reproduction score which served as an index of reconstitutive memory.
Findings: No child making a perfect reproduction at one week failed to do so at six months. Many scores improved over the six-month period, but very few deteriorated. Contingent reward, when presented just before one-week reproductions, yielded more perfect scores than either no reward or guaranteed reward under the same conditions. There were fewer perfect scores with one week than with immediate reproduction in no reward and guaranteed reward but not in contingent reward when reward immediately preceded reproduction.
Duration: October 1967-Completed.
Investigator(s): Nancy Wray Dahlem, Ph.D., Assistant Professor of Psychology, St. Louis University, St. Louis, Mo. 63103.
Cooperating group(s): Moorhead State College.
Publications: To be submitted to *Psychonomic Science*.

23-DC-10 STIMULUS SELECTION IN DISCRIMINATION LEARNING

Purpose: To study a number of theoretical problems in discrimination learning using a more precise measure of the dependent variable.
Subjects: Eight-year-old children.
Methods: An objective record, by means of an eye movement camera and specially designed stimulus configurations, is made of the amount of time a child spends "attending" certain stimulus elements, as well as the area screened in a stimulus configuration. A discrimination learning apparatus is used to examine the way in which development affects learning in certain discrimination learning tasks, including the over-training reversal effect, the influence of relevant and irrelevant stimuli, and the informational value of the stimulus.
Duration: June 1967-August 1969.
Investigator(s): Vincent J. Tempone, Ph.D., Associate Professor of Psychology, University of Arizona, Tucson, Ariz. 85721.
Cooperating group(s): Early Childhood Research and Development Center, University of Arizona; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Will submit publications to appropriate developmental psychology journals.

23-DC-11 SOCIAL CLASS, RACE, SERIATING AND READING READINESS: A STUDY OF THEIR RELATIONSHIP AT THE KINDERGARTEN LEVEL

Purpose: To gain information concerning the significance of seriation skills on young children's cognitive growth, and to test the Inhelder-Piaget postulation that a close association exists between children's ability to seriate and classify (or between language and perceptual development).
Subjects: All the 356 kindergarten students of four Waterloo, Iowa schools which were selected so that racial and social class differences could be assessed.
Methods: The LRS Seriation Test (LRS-ST) was administered and results compared with scores on the Metropolitan Reading Readiness Test (MRRT). It was predicted that LRS-ST scores will be significantly correlated with subtest and total MRRT scores, and that Negro and lower class children will obtain significantly lower LRS-ST scores than white or middle class children. Subsequent assessments, to determine the predictive characteristics of the LRS-ST and the MRRT, are planned.

Findings: Correlations of the LRS-ST with total MRRT and the Reading Readiness and Number Readiness subtests of the MRRT were .82, .77, and .69, respectively; these correlations indicate that seriation is an important aspect of early intellectual growth and appear to support the Inhelder-Piaget position concerning the interaction of seriation and classification. White children attained significantly higher LRS-ST scores than Negro children, but no statistically significant social class differences were obtained. The nonsignificant social class differences appear associated with narrow within-race but wide between-race LRS-ST differences.
Duration: May 1966-continuing.
Investigator(s): Ralph Scott, Ph.D., Director, Educational Clinic, University of Northern Iowa, Cedar Falls, Iowa 50613.
Cooperating group(s): Office of Research, University of Northern Iowa; Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Journal of Genetic Psychology, in press, 1968.

23-DD-1 MIRROR IMAGE FORM CONFUSION IN RELATION TO AGE AND INTELLIGENCE

Purpose: To determine whether the young child's tendency to confuse mirror image (MI) forms is due to his inability to "see a difference" between them, and whether the confusion of such forms is related to general ability as measured by a verbal and nonverbal intelligence test.
Subjects: 65 normal elementary school children in kindergarten through third grade.
Methods: Children judged pairs of patterns projected on a screen "same" or "different" by pressing one of two large keys, and reported when side-to-side movement appeared when the rate of alternation of two forms was varied (Phi threshold). Components of pattern pairs differed only in orientation: they were mirror image, different; nonmirror image, different; or identical. All subjects were given Raven's Colored Progressive Matrices (children seven or under, Formboard version; those over seven, Book version) and the PPVT.
Findings: Many of the children judged some MI pairs as "same" but all 65 gave clear evidence, in the paired comparison task or by showing which way the forms pointed, of their ability to "see a difference" between the forms. The Phi technique gave no evidence of discrimination: thresholds for MI and identical pairs did not differ significantly. Raven's Matrices and MI scores correlated significantly ($r = .46$, $P < .01$). PPVT and MI scores showed a lower, but still significant, correlation ($r = .21$, $P < .05$).
Duration: July 1965-June 1968.
Investigator(s): John S. Robinson, Ph.D., Research Psychologist, Sonoma State Hospital, State Department of Mental Hygiene, Eldridge, Calif. 95431.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Perceptual and Motor Skills 25:893-897, 1967; additional publications planned.

23-DE-1 DEVELOPMENTAL STUDY OF DISJUNCTIVE CONCEPT LEARNING, EGO SYNTHESIZING CAPACITY, AND CREATIVITY

Purpose: To obtain basic information about disjunctive concept learning and to study its theoretical and experimental relevance as a miniature model for unifying other areas of developmental psychological functioning.
Subjects: Children, ages five to nine.
Methods: Overall experimental design is an analysis of covariance for repeated measurements. Effects of the stimulus variables of concept complexity and redundancy on the disjunctive concept learning of subjects

will be studied. Theoretical and logical considerations suggest that disjunctive concept learning may provide both a heuristic cognitive model and an experimental task for studying developmental characteristics of the ego's synthesizing capacity and of the divergent thinking aspect of creativity. Possible positive relationship between synthesizing ability and divergent thinking will be evaluated.
Duration: June 1967-May 1969.
Investigator(s): Eugene Shore, Ph.D., Child Psychologist, Department of Psychiatry, Albert Einstein Medical Center, York and Tabor Rds., Philadelphia, Pa. 19141.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.

23-DE-2 LOGICAL OPERATIONS AND CONCEPTS OF CONSERVATION IN PRESCHOOL CHILDREN

Purpose: To test the adequacy of Piaget's theory of concept development to determine the effects of conservation training; to study the relationships between conservation processes and products.
Subjects: Five-year-old nursery school children.
Methods: All children were tested for understanding of basic concepts, i.e., same, more, and less. Children who had acquired these concepts were pretested for understanding of conservation operations and concepts; relationships between operations and concepts were then studied in subjects who did and did not understand concepts and operations of conservation. The latter group received training developed by Roeper and Sigel (1964). Posttests were administered to the training and control groups and results subjected to analysis of variance on repeated measures. Stability of cognitive changes was studied after a three-month interval.
Duration: January 1966-May 1967.
Investigator(s): Irving E. Sigel, Ph.D., Chairman, Department of Research, Merrill-Palmer Institute, 71 E. Ferry Ave., Detroit, Mich. 48202.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

23-DE-3 THE EFFECT OF VARIOUS TRAINING PROCEDURES ON THE ACQUISITION OF PRENUMBER CONCEPTS

Purpose: To ascertain whether various training procedures can influence the acquisition of the prenumber concept of conservation of substance; specifically, to test the hypothesis that cognitive conflict training procedure will influence the acquisition of the concept of conservation whereas language training, multiple classification training, and verbal rule instruction will not.
Subjects: Equal number of white male and female children from nursery schools, kindergarten classes, and Head Start projects.
Methods: Subjects were randomly assigned to two control conditions and four training conditions, cognitive conflict, language activation, multiple classification, or verbal rule instruction. Measures were taken of performance on verbal and nonverbal conservation tasks one week, one month, two months, and three months after the training period. Data were subjected to chi-square tests of significance.
Duration: 1966-not reported.
Investigator(s): Egon Mermelstein, Ph.D., Assistant Professor of Elementary Education, Hofstra University, Hempstead, N. Y. 11550.
Cooperating group(s): U. S. Office of Economic Opportunity; Office of Education, U. S. Department of Health, Education, and Welfare.

23-DE-4 IMPACT OF LITERACY ON CONCEPTUAL THINKING

Purpose: To conduct a pilot investigation of the effect of written language on categorizing behavior; to test hypothesis that subjects working with verbal materials would utilize abstract-conceptual bases for grouping significantly more often than subjects working with objects or pictures.
Subjects: 30 boys and girls, ages 12 to 15, in middle and lower socioeconomic brackets, attending urban day camp programs.
Methods: Three stimulus arrays were used in a sorting test: a collection of 13 familiar objects, a set of 13 cards showing pictorial representations of these objects, and a set of 13 cards containing brief verbal descriptions of these objects. The array was constructed to provide perceptual, functional, and abstract-conceptual bases for sorting. Subjects were randomly assigned to one of the arrays, and each was required to perform three trials, using a different basis for grouping on each trial.
Findings: Preliminary analysis indicates hypothesis strongly confirmed.
Duration: June 1968-June 1969.
Investigator(s): Sylvia Scribner, M.A., Research Associate, Division of Psychology, Department of Psychiatry, Albert Einstein College of Medicine, Bronx, N. Y. 10461.
Publications: Paper will be submitted to psychological journal.

23-DE-5 THE VALUE OF THE SPOKEN RESPONSE IN DEVELOPING CERTAIN LISTENING SKILLS

Purpose: To assess the value of procedures designed to teach five-year-old children to listen to and use the most common conceptual rules.
Subjects: 120 kindergarten children from a lower class neighborhood randomly assigned to a control group and two experimental groups: (1) an oral responding group; (2) nonoral.
Methods: A program designed to teach the child to use conceptual rules has been prepared for administration to children in groups of four to six. All children in the two experimental groups continuously respond in the program (by identification of pictures), but those in the oral group are taught to speak aloud in addition.
Duration: January 1967-October 1968.
Investigator(s): Evan R. Keislar, Ph.D., Professor, Department of Education, and Carolyn Stern, Ed.D., Director, Research Projects in Early Childhood Learning, University of California, Los Angeles, Calif. 90024.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Journal publication planned.

23-DF-1 READINESS OF RURAL AND URBAN CHILDREN TO LEARN CRITICAL THINKING

Purpose: To develop logic testing procedures for children ages six to nine; to determine the level of particular-principle logic mastery of a variety of children in this age range who have not received special instruction in logic; to see whether children of these ages are ready to learn basic principles of logic (if they do not already know them).
Subjects: 600 primary school children selected from various social class and residential backgrounds.
Methods: Two types of tests of basic principles of conditional and class logic, one a paper-and-pencil test, and the other based upon logical relationships existing in certain simple physical situations, will be

developed, compared, and the most valid one selected for final use. Techniques, probably autoinstructional, will be developed for teaching the basic principles of class and conditional logic to primary school students. In 1968-1969, these teaching techniques will be used with 300 selected students, 100 from each of grades one to three. In the Spring of 1969, the selected test will be administered to all 600 students. The instructed students will be compared with the uninstructed, using analyses of covariance. Multiple correlation techniques will be used to develop readiness equations based upon the instructed students.
Duration: July 1967-August 1969.
Investigator(s): Robert H. Ennis, Ph.D., Associate Professor of Education, and Edward Smith, B.S., Research Associate, Department of Education, Cornell University, Ithaca, N. Y. 14850.
Cooperating group(s): Department of Philosophy, Department of Child Development and Family Relationships, and New York State College of Agriculture, Cornell University.

23-DF-2 INFORMATION-PROCESSING IN CHILDREN AS A FUNCTION OF ADULT MODEL, STIMULUS DISPLAY, SCHOOL GRADE, AND SEX

Purpose: To study the influence of the information-processing strategy of an adult model on the subsequent strategy employed by children.
Subjects: 216 children, equally divided between boys and girls, in grades three, five, and seven.
Methods: A 3 x 2 x 3 x 2 x 2 repeated-measures design was used with the following variables: (1) information-processing of model (hypothesis scanning, constraint seeking, or control), (2) stimulus display (pictorial or verbal), (3) school grade, (4) sex, and (5) problems (two per subject). The child first watched an adult model solve a modified 20-question problem in which he attempted to identify the particular designated object of 42 drawings or words. The model employed either a strategy of hypothesis scanning or constraint seeking, while in control conditions the child did not observe the model. Then the child solved two comparable problems himself.
Findings (1) Fewer questions to solution with the constraint-seeking model than the hypothesis-testing model or control, who did not differ; (2) both a higher percentage of constraints, and higher average number of items included per question, for the constraint-seeking model; (3) increasingly better performance by grade; (4) significant model by grade interactions for both percentage of constraints and items per question; and (5) no effects for stimulus display, sex, or successive problems on any measure.
Duration: September 1967-August 1968.
Investigator(s): Patrick R. Laughlin, Ph.D., Associate Professor of Psychology, Loyola University, Chicago, Ill. 60626.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Journal of Educational Psychology, in press, 1968.

23-DG-1 CROSS-CULTURAL COMPARISONS OF THE PERCEPTUAL-COGNITIVE PROCESSES

Purpose: To compare children, adolescents, young adults, mature adults, and older subjects from Brazil, Mexico, and the United States on a variety of perceptual-cognitive tasks.
Subjects: Grammar and high school children (some from the slums), university students, young professionals, and older people.

Methods: A variety of perceptual measures such as autokinesis and the Mooney Test have been administered, as well as the Porteus Maze, the Einstellung Test, Harvey's TIB Scale, the Holtzman Inkblot Test, MMPI, Penney Curiosity Scale, and other specially developed techniques.
Findings: Preliminary results indicate close similarities in some measures such as the autokinetic and the Mooney Test and important differences on measures such as the Holtzman Inkblot Test.
Duration: September 1966-indefinite.
Investigator(s): John F. Santos, Ph.D., Professor and Chairman, and B. J. Farrow, Ph.D., Assistant Professor, Department of Psychology, University of Notre Dame, Notre Dame, Ind. 46556; Aroldo Rodrigues, Ph.D., Director, Psychological Clinic, Catholic University, Rio de Janeiro, Brazil.
Cooperating group(s): Institute for Latin American Population Research, University of Notre Dame; Catholic University, São Paulo, Brazil; National University, Mexico City, Mexico; Agency for International Development, U. S. Department of State.
Publications: One or several monographs planned; interim information available from Dr. Santos.

23-DG-2 INTELLIGENCE AND PERCEPTUAL DEVELOPMENT IN CHILDHOOD

Purpose: To examine the components of measured intelligence in relation to perceptual age changes.
Subjects: Suburban school children in kindergarten through eighth grade.
Methods: Experimental studies of perceptual age changes are conducted, applying appropriate psychophysical methods, and correlated with various cognitive performances.
Duration: May 1965-April 1970.
Investigator(s): Robert H. Pollack, Ph.D., Deputy Director of Research, and Chief, Division of Cognitive Development, Institute for Juvenile Research, 608 S. Dearborn St., Chicago, Ill. 60605.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Psychonomic Science 8:4:141-142, 1967, 5:243-244, 1966, and 4:401-402, 1966; others.

23-DG-3 EFFECTS OF LABELS ON PERCEPTION

Purpose: To investigate several parameters which may influence linguistic modification of perceptual responses; specifically (1) developmental level of the subject; (2) degree of perceived stimulus similarity; (3) type of label employed; (4) type of response task required of the subject.
Subjects: First- and sixth-grade children.
Methods: On the theoretical level, an original model is presented which generates specific predictions concerning the relationships among developmental, stimulus, and linguistic variables. These predictions are tested by an interrelated series of studies. At the methodological level, a new measure for the assessment of perceptual similarity has been developed. This measure provides for a greater opportunity for response differentiation than has been characteristic in earlier studies. Employing this index, similarity relationships among a wide variety of systematically varying nonsense forms are currently being obtained.
Duration: Not reported-December 1968.
Investigator(s): Phyllis A. Katz, Ph.D., Associate Professor of Psychology, College of Arts and Science, New York University, Bronx, N. Y. 10453.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.

23-DG-4 CHILDREN'S PERCEPTIONS OF VERBAL REINFORCEMENTS: DETERMINANTS AND LEARNING OUTCOMES

Purpose: To investigate the influence of personality and stimulus characteristics on children's perceptions of the meaning of verbal reinforcements; to determine individual differences in perceptions and whether those reinforcements which are perceived differently by different children have varying degrees of effectiveness when used in a learning task.
Subjects: 96 nine-year-old boys.
Methods: In the first of three experimental sessions, the child's perceptions of meaning of a variety of verbal reinforcers were elicited in a hypothetical situation played to him on a tape recorder. In the second session, similar reinforcers were used but were related to the child's own performance. In these sessions the subject's perceptions of each reinforcer were elicited. In a third session, a reinforcer from an earlier session was used in a two-choice concept learning task. Personality characteristics such as need for achievement and approval, anxiety, and locus of control were measured by standardized tests.
Findings: In the first two sessions it was found that both content and intonation of verbal reinforcers affected children's perceptions of reinforcers, content being more important. There were some personality differences which influenced the child's perception of reinforcers for some content-intonation conditions.
Duration: February 1967-February 1968.
Investigator(s): Daniel Solomon, Ph.D., Senior Research Associate, Institute for Juvenile Research, 232 E. Ohio St., Chicago, Ill. 60611.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Paper read at Psychonomic Society Meeting, October 1967; data to be published in professional journals.

23-DG-5 PERCEPTION OF DIFFERENTLY ORIENTED SHAPES IN NORMAL AND RETARDED CHILDREN

Purpose: To investigate developmental differences in the perception of differently oriented shapes.
Subjects: Two core groups of children of average intelligence, ages 4 to 6 and 8 to 10; two groups of superior children, equated with core groups on chronologic age; and two groups of retarded children, equated with core groups on mental age.
Methods: Pairs of stimuli in various orientations were presented at two exposure times, and subject was asked to recognize the identical pairs. Data are analyzed to determine degree to which the perception of differently oriented shapes is a function of mental age, chronologic age, and exposure time.
Duration: Not reported-June 1968.
Investigator(s): Ruth F. Deich, Ph.D., Pacific State Hospital, Pomona, Calif. 91769.

23-DG-6 PERCEPTUAL LANGUAGE TEST BATTERY AND SCHOOL ACHIEVEMENT IN DISADVANTAGED CHILDREN

Purpose: To explore the development of the perceptual abilities of culturally disadvantaged children; to discover whether such children, as reported, do show lags in development; and to relate such perceptual lags, if they occur, to school achievement.
Subjects: 134 first grade children in an economically depressed Negro neighborhood, selected as a random sample of those entering first grade.

Methods: Children are tested on a battery of perceptual level tests on entry into first grade and at end of second and third grades. Achievement tests will also be administered at end of second and third grades.
Duration: September 1967-June 1970.
Investigator(s): Paul S. Weiner, Ph.D., Assistant Professor of Psychology, and Joseph M. Wepman, Ph.D., Professor of Psychology, University of Chicago, Chicago, Ill. 60637.
Cooperating group(s): Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.
Publications: Journal publication planned.

23-DH-1 RECEPTIVE-EXPRESSIVE VOCABULARY AND SOCIAL STATUS POSITION

Purpose: To relate differences in receptive-expressive vocabulary as a function of socioeconomic background.
Subjects: Over 200 children representing various backgrounds from schools in Atlanta.
Methods: The Peabody Picture Vocabulary Test is administered under the usual conditions (Form A) (recognition-reception), and the same stimulus words (Form B) are used to have the child explain what they mean (expression).
Findings: Negro children show a greater discrepancy in expression than white children, with minimal differences in reception.
Duration: January 1967-December 1968.
Investigator(s): Luciano L'Abate, Ph.D., Professor of Psychology, Georgia State College, Atlanta, Ga. 30303.
Publications: Paper read at Council of Exceptional Children Meeting, 1968.

23-DH-2 LANGUAGE DEVELOPMENT IN YOUNG CHILDREN

Purpose: To better understand the development of those phases of children's language which are systematically and directly reflective of less overt thought processes; to develop and refine testing and data analysis methods which allow for less structure in stimuli items or response formats, to make possible the obtaining of data from the young children, with minimum loss of reliability and validity.
Methods: Conceptual models are developed and tested, and language data collected, scored, and analyzed.
Duration: Not reported-August 1968.
Investigator(s): Jeremy D. Finn, Ph.D., Department of Educational Psychology, State University of New York, Buffalo, N. Y. 14214.

23-DH-3 A PRELIMINARY STUDY OF THE STRUCTURE OF ENGLISH USED BY NEGRO AND PUERTO RICAN SPEAKERS IN NEW YORK CITY

Purpose: To determine the socially significant variables in English structure which distinguish Negro and Puerto Rican speakers from the rest of the New York City speech community, and to define those conflicts of the Negro and Puerto Rican vernaculars which interfere with the acquisition of reading skills.
Subjects: Negro and Puerto Rican youth.
Methods: Trained interviewers and analysts measured the relevant linguistic variables, taking into account structural and functional

conflicts, the two types of underlying causes in failure to acquire the use of standard English. They then isolated the chief linguistic variables responsible for structural conflict.
Findings: Tentative conclusions were: final consonants, when followed by silence, are often not realized in these dialects; most teachers do not have the information that would allow them to distinguish between mistakes in reading and nonstandard forms of pronunciation; the standard tests of the child's ability to distinguish speech sounds are not adequate for the urban areas described; and the most general rule which is different in the language of nonstandard and standard speakers should be isolated and taught if it is relevant to the process of reading.
Duration: Not reported.
Investigator(s): William Labov, Paul Cohen, and Clarence Robins, Department of Linguistics, Columbia University, New York, N. Y. 10027.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

23-DH-4 FACTORS OF VISUAL PERCEPTION IN LANGUAGE LEARNING PROBLEMS

Purpose: To develop items for measuring selected dimensions of visual perception--closure and figure-ground discrimination; to contribute to the improvement of known methods or the development of new procedures to be used in the education of children with language learning problems.
Subjects: Children, ages three to six, in preschool or regular school programs.
Methods: Children are examined on standard tests which depend upon the visual avenue for eliciting responses, and on measurements of visual closure, figure-ground discrimination, and perceptual speed, adapted and designed specifically for this study. A correlation matrix will be constructed to consider relationships among responses to the various test situations. Children's test behavior will be analyzed and related to language learning.
Duration: September 1966-September 1969.
Investigator(s): Nancy E. Wood, Ph.D., Professor, Graduate Program in Communicative Disorders, and Director of Language Pathology, University of Southern California, Los Angeles, Calif. 90007.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Publication planned in professional journals.

23-DH-5 FACTORS OF AUDITORY PERCEPTION IN LANGUAGE LEARNING PROBLEMS

Purpose: To develop methods for measuring selected dimensions of auditory perception--closure, figure-ground discrimination, and duration; to contribute to the improvement of known methods or the development of new procedures to be used in the habilitation of children with language learning problems.
Subjects: Children, ages three to seven, in preschool or regular school programs.
Methods: Children are divided into two groups, one with language learning problems, and the other with adequate language development for speech. Both groups are examined on standard tests which depend upon the auditory avenue for eliciting responses, and on measurements of auditory closure, figure-ground discrimination, and perceptual speed, adapted and designed specifically for this project. Within-group and between-group variations will be assessed and a correlation matrix constructed to consider relationships among responses to the various test situations.

Duration: September 1967-August 1970.
Investigator(s): Nancy E. Wood, Ph.D., Professor, Graduate Program in Communicative Disorders, and Director of Language Pathology, University of Southern California, Los Angeles, Calif. 90007.
Cooperating group(s): Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.
Publications: Publication planned in professional journals.

23-DH-6 LANGUAGE RETARDATION UNIT OF THE COMMUNICATION SKILLS CENTER PROJECT

Purpose: To develop methods and insight into the communication abilities, or lack thereof, of severely language-retarded preschool children; to provide information by investigating the causes, nature, and new treatments of language disorders.
Subjects: Children, ages two-and-one-half to four-and-one-half, who appear to be organically sound and intellectually average or better, but who cannot or do not communicate.
Methods: Children are seen individually or in groups of two to five for brief periods of intensive instruction separated by other kinds of activity, such as language-oriented play therapy. Teachers use a variety of teaching techniques specifically geared toward language development and another group of techniques designed to meet children's needs for nonverbal training. Instructional materials used include toys, dolls, puppets, games, raised figures, records, tape recorders, large mirrors, a play village, stories, books, blackboards, bulletin boards, and flannel boards.
Findings: Of the 20 children originally in the project, seven are attending regular school classes while continuing treatment in the unit. Their fulltime release from the unit is anticipated in the near future.
Duration: March 1966-June 1969.
Investigator(s): Theodore Mandell, Ed.D., Supervisor, Speech Correction Classes and Hearing Conservation, and Frances Eldis, M.A., Clinician, Speech and Hearing Clinic, Detroit Public Schools, 5057 Woodward, Detroit, Mich. 48202.
Publications: Report and evaluation available from Dr. Mandell after September 1969.

23-DH-7 INCREASING VERBAL COMMUNICATION SKILLS IN CULTURALLY DISADVANTAGED PRESCHOOL CHILDREN

Purpose: To develop measures of verbal communication skills, assess effectiveness of a training program based on operant approach, and develop a technique for teaching training program to lay volunteers.
Subjects: 30 children, ages three to five, enrolled in local Head Start program.
Methods: All subjects are pretested on specially devised test of verbal communication skill and experimental and control groups established on basis of age, sex, and pretest score. Experimental group undergoes a 30-session training procedure in which small subgroups of five children each will be systematically rewarded with food, trinkets, praise, and approval, contingent on their verbal productions of gradually increasing complexity. Training sessions are 15 minutes, once a day, five days per week for six weeks. All subjects are retested at conclusion of training.
Findings: Communication skills can be reliably tested.
Duration: June 1968-June 1969.
Investigator(s): Alan O. Ross, Ph.D., Professor of Psychology, State University of New York, Stony Brook, N. Y. 11790.

Cooperating group(s): Economic Opportunity Council of Suffolk, Inc., Patchogue, N. Y.; Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Publication planned in relevant professional journals.

23-DH-8 STUDIES OF LINGUISTIC CONTROL IN CHILDHOOD

Purpose: To chart knowledge of grammatical structure and the development of communication skills in the early school years.
Subjects: Middle class and underprivileged children in the Boston area.
Methods: Communication skills are studied in a minimal communication situation in which an encoder names items in an array so that a decoder can identify them. Methods include imitation and evidence of sentence comprehension.
Findings: Communication skills are not readily improved by simpler forms of feedback knowledge of decoder's choices.
Duration: June 1967-May 1972.
Investigator(s): Roger Brown, Ph.D., Professor of Social Psychology, Department of Social Relations, Harvard University, Cambridge, Mass. 02138.

Personality

23-EA-1 DELAY OF REINFORCEMENT AND CHILDREN'S BEHAVIOR

Purpose: To gain a comprehensive understanding of children's behavior in relation to delay of reinforcement.
Subjects: Children, ages 1 to 14.
Methods: A variety of methods are being used in 18 systematic and interrelated experiments.
Findings: In a simple instrumental situation (lever pulling), delay of reinforcement is associated with greater persistence in responding than is immediate reinforcement.
Duration: March 1967-June 1969.
Investigator(s): F. Michael Rabinowitz, Ph.D., Assistant Professor of Psychology, University of Washington, Seattle, Wash. 98105.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Psychological Reports 22:639-646, 1968.

23-EA-2 AUTHORITY, RULES, AND AGGRESSION--A CROSS-NATIONAL STUDY OF SOCIALIZATION INTO COMPLIANCE SYSTEMS

Purpose: To study the socialization of behavior involved in the control-aggression-compliance relationship between children and authority figures; to examine relationships between aggression toward peers and aggression toward adult authority in terms of social, cultural, and psychological variables.
Subjects: Children in grades four, six, and eight from cities in the United States, Italy, Greece, Denmark, India, and Japan.

Methods: Researchers drawn from middle and working class socioeconomic levels will gather data through questionnaires, semistructured projective techniques, interviews, sociometric peer nomination techniques, and teachers' ratings. Data will be analyzed to determine relationship among social, cultural, and psychological variables and the extent to which aggressive behavior and compliance toward peers and adult authority are determinable and predictable from variables built into the study design.
Duration: Not reported.
Investigator(s): Robert D. Hess, Ph.D., Lee Jacks Professor of Child Education, School of Education, Stanford University, Stanford, Calif. 94305.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

23-EA-3 THE RELATIONSHIP BETWEEN ADULT NURTURANCE AND DEPENDENCY AND PERFORMANCE OF THE PRESCHOOL CHILD

Purpose: To test hypotheses that (1) performance of preschool children on a complex task is more efficient under nurturant conditions than under nurturance-deprivation conditions, and (2) under nurturance-deprivation, children high in dependency will perform less efficiently than children low in dependency.
Subjects: 24 four-year-olds, 12 of each sex, in a preschool program.
Methods: Beller's 7-point behavior rating scale used to identify high and low dependency; nurturant and nurturance-deprivation manipulated by behavior of experimenter in a puzzle test.
Findings: Both hypotheses were confirmed. No significant sex differences.
Duration: Spring 1967-Spring 1968.
Investigator(s): W. Edgar Vinacke, Ph.D., Professor of Psychology, and Russell DiBartolo, Ph.D. Candidate, State University of New York, Buffalo, N. Y. 14214.
Cooperating group(s): National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Accepted for publication in Developmental Psychology.

23-EB-1 MASCULINITY AND FEMININITY IN THE ELEMENTARY AND JUNIOR HIGH SCHOOL YEARS

Purpose: To determine the nature and development of masculinity and femininity in the elementary and junior high school years; to explore the relationship between appropriateness of sex identity and academic achievement.
Subjects: Two classes of middle class boys and girls at each grade one through eight, and their teachers.
Methods: Each child took Cattell's Early School Personality Questionnaire, Children's Personality Questionnaire, or Junior-Senior High School Personality Questionnaire and made self- and peer ratings on a four-point scale of masculinity or femininity, depending upon sex. Each teacher made judgments of masculinity of the boys in her class and femininity of the girls by pair comparisons. Stanford Achievement Test scores and Lorge-Thorndike I.Q.'s were obtained from each child's school record. Multiple regression analyses, using masculinity and femininity scores and the personality test scores, will be done to determine the nature and development of masculinity and femininity. Correlations between ratings of masculinity and femininity, and I.Q./academic achievement ratios will be obtained.

Duration: May 1967-May 1968.
Investigator(s): Karen Vroegh, M.A., Research Associate, Noel Jenkin, Ph.D., Director of Research, and Millicent Handrich, B.A., Junior Research Associate, Institute for Juvenile Research, 232 E. Ohio St., Chicago, Ill. 60611.
Publications: To be published in one or more professional journals.

23-EB-2 EFFECT ON EGO FORMATION OF CONGENITAL SENSORY DEFICITS

Purpose: To investigate the processes of ego formation with the assumption that sensory deprivation of various modalities will throw into relief adaptive processes which, in the normally equipped infant, are necessarily obscured.
Subjects: Congenitally blind and congenitally hard-of-hearing children as well as children who have suffered significant extended periods of maternal deprivation.
Methods: Approximately monthly extended observations of each child are carried out in the home environment and are accompanied by interviews and discussions with parents and other members of the household. Where they seem relevant, laboratory and psychological tests are used to supplement observations. In particular, the development of the object concept has been followed.
Findings: Hard-of-hearing and deaf children do not appear to have the same susceptibility to autistic-like reactions as characterize the congenitally blind. Maternal deprivation any time during the first two years of life appears to be associated with significant growth retardation. The nature of affective disturbances, however, varies considerably as a function of the time deprivation began.
Duration: March 1967-February 1970.
Investigator(s): David A. Freedman, M.D., Associate Professor of Psychiatry and Neurology, Baylor University College of Medicine, Houston, Tex. 77025.
Cooperating group(s): Texas Children's Hospital; National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Papers accepted for publication in Psychoanalytic Quarterly and Psychosomatics.

23-EB-3 RESISTANCE TO EXTINCTION AS A FUNCTION OF SCHEDULE OF REINFORCEMENT, PERCEIVED LOCUS OF REINFORCEMENT, AND SEX OF CHILD

Purpose: To relate persistence after instrumental conditioning to reinforcement schedule and to whether the child believes he is rewarded because of his skill or because of his luck. J. B. Rotter found that resistance to extinction in adults varies according to such independent variables.
Subjects: 64 male and female Negro children enrolled in a Head Start program.
Methods: Children received 40 acquisition trials and 20 extinction trials and were then asked to press consecutively five telegraph keys on a stimulus display panel. The three variables of schedule reinforcement (50 percent vs. 100 percent), instructions (luck vs. skill), and sex were combined in a factorial design. Dependent variable was response speed, and data were analyzed in terms of starting, running, and finishing speeds.
Findings: Consistent with Rotter's research, an interaction effect was obtained between schedule of reinforcement and instructions. Under luck

instructions, the usual partial reinforcement effect was obtained, but under skill instructions, an inverse partial reinforcement effect occurred. Starting speed measures showed faster speeds for females than males during extinction.
Duration: August 1967-January 1969.
Investigator(s): John R. Stabler, Ph.D., Associate Professor, and Robert Baker, Research Assistant, Department of Psychology, Louisiana State University, Baton Rouge, La. 70803.
Cooperating group(s): Louisiana State University Computer Center; U. S. Office of Economic Opportunity.
Publications: Publication planned in psychological journal.

23-EC-1 LEARNING OF INCENTIVE VALUE IN CHILDREN

Purpose: To determine some of the principles whereby neutral objects come to be reacted to as pleasant or unpleasant, and to determine the effects of both acquired pleasantness and unpleasantness on numerous forms of behavior, including verbal evaluation, expectancy of reward, choice behavior, curiosity, and various aspects of selective attention.
Subjects: Hundreds of normal children, ages 7 to 12.
Methods: Nonsense syllables are used as cues in discrimination learning. Some syllables are related to obtaining rewards (e.g., money or candy), others are related to some type of punishment (e.g., loss of money), and others signal neutral events. Children are taken to a stringent criterion of 100 percent learning of the discriminations. One or more days later dependent measures are applied. Parameters of learning, such as amount of reward, circumstances under which rewards are received, schedules of reward, and others, are manipulated.
Findings: Association of neutral objects with rewards has the predicted effects on many of the dependent measures. Also, results are affected in a regular manner by various treatment parameters.
Duration: September 1967-August 1970.
Investigator(s): Jum C. Nunnally, Ph.D., Professor and Chairman, Department of Psychology, Vanderbilt University, Nashville, Tenn. 37203.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Child Development 39:159-166, 1968; others.

23-EC-2 RESEARCH ON THE PROCESSES OF INTERNALIZATION OF RULES, STANDARDS, AND VALUES

Purpose: To investigate the correspondence between fantasy measures of moral behavior and actual behavior in a temptation test, the influence of mother-child interaction on cheating behavior, and the relationships between achievement, delay of gratification, and cheating.
Subjects: 80 to 150 children, ages four to six.
Methods: Story completion tests were used before and after the child was tested for cheating in an experimental situation, and responses were scored to indicate guilt feelings. Resistance to temptation was measured by observing the child's conformity to the rules of a simple bean bag game, both with and without his mother's presence. Observations were made through a one-way mirror.
Duration: Continuing.
Investigator(s): Roger V. Burton, Ph.D., Research Psychologist, Laboratory of Socio-environmental Studies, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda, Md. 20014.

23-EF-1 DEPRESSIVE PHENOMENA IN CHILDHOOD

Purpose: To clarify the nature of depression in childhood and its relationship to adult depression.
Subjects: Initially, 30 in- and outpatients of Children's Hospital.
Methods: Currently being developed.
Duration: July 1968-June 1973.
Investigator(s): Leon Cytryn, M.D., Research Associate, Children's Hospital, Washington, D. C. 20009.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

Social

23-FA-1 ASSESSMENT OF RELATIONSHIPS THROUGH MESSAGE PREFERENCES

Purpose: To test hypothesis that children evaluate interpersonal messages differently depending upon the person to whom the message is attributed; to determine the dimensions which underlie the acceptability of interpersonal messages to children and whether these dimensions are the same for different relationships.
Subjects: Approximately 350 boys, ages 8 to 13, members of two Boys Clubs.
Methods: Each subject evaluated the desirability of 63 interpersonal messages (e.g., "I am stronger than you are"; "You don't really need me") via a nonforced Q-sort, with instructions to assume that the messages were from mother, best friend, Boys Club staff member, or policeman. Hypothetical message sources were assigned at random. After evaluating the standard messages, each subject was asked to construct the message he would most like to receive from the assigned source, to record this message, and to choose between hearing it replayed or receiving an M&M candy on each of 15 trials. The 63 messages were factor analyzed for each relationship, and the four relationships were compared for factor structure and rated desirability of various types of message.
Findings: Preliminary analysis indicates significant differences between groups for the four relationships on about 20 percent of the individual messages.
Duration: January 1967-January 1968.
Investigator(s): Malcolm M. Helper, Ph.D., Associate Professor of Medical Psychology, University of Nebraska College of Medicine, Omaha, Neb. 68105.
Publications: Journal publication planned, probably after replication.

23-FA-2 LEARNING CONSIDERATION FOR OTHERS: THE INFLUENCE OF MODELING AND REINFORCEMENT

Purpose: To determine the extent to which one can influence the development of consideration for others in preschool children.
Methods: Pictures and contrived "real" situations of mild distress were used to test children's response to distress. Children were then randomly assigned to one of four experimental groups or a control group. Those in Groups A and B received higher nurturant treatment from the experimenter during play sessions on four consecutive days; children in Groups C and D received relatively little nurturance. Groups B and D then received four days of training consisting of adult modeling of considerate actions. Posttests paralleling the baseline tests given prior to the experiment were administered to all groups on the day after the training of Groups B

and D; a second set of behavioral posttests was administered two weeks later.
Findings: More learning resulted from a high nurturant relationship with the model than from a low nurturant one.
Duration: Not reported-1968.
Investigator(s): Marian Radke Yarrow, Ph.D., Chief, and Phyllis M. Scott, Ph.D., Visiting Associate, Section on Developmental Psychology, Laboratory of Socio-environmental Studies, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda, Md. 20014.

23-FA-3 A DEVELOPMENTAL STUDY OF BALANCE AS AN ORGANIZING PRINCIPLE OF INTERPERSONAL PERCEPTION

Purpose: To investigate the validity of Heider's balance principle of interpersonal perception among adolescent and preadolescent age groups; to determine age differences in tendencies to balance.
Subjects: 261 males and females, ages 10 to 19, in grades 5, 8, and 11, and second-year college students.
Methods: Subjects are shown the verbal story form of the Heider-Simmel (1944) film, involving a triadic interpersonal situation. They are then asked to give a written description of the story plot and to rate the three story characters for their personal attributes, attitudes toward one another, and affiliative relationships.
Findings: Heider's balance principle was confirmed at all age levels; there were no age differences in tendencies toward balance.
Duration: 1965-January 1968.
Investigator(s): Arthur Alan Shaw, Ph.D., Clinical Psychologist, Veterans Administration Center, Wadsworth, Kan. 66089.
Publications: Doctoral dissertation available through Dissertation Abstracts, University Microfilms, Ann Arbor, Mich. 48103.

23-FA-4 INTELLIGENCE AND CREATIVITY: THEIR EFFECT ON PEER ACCEPTANCE

Purpose: To investigate the effects of intelligence and creativity on peer acceptance.
Subjects: Stratified random sample of 400 Idaho Falls elementary school children, grades two through six.
Methods: Peer acceptance ratings in social and academic situations are being analyzed. Two separate 5 x 2 x 2 x 2 x 10 analyses of variance are being carried out.
Findings: Preliminary results suggest distinct relationships and significant interactions between intelligence and creativity and peer acceptance.
Duration: January-October 1968.
Investigator(s): John F. Jacobs, M.Ed., Assistant Professor, Utah State University, Logan, Utah 84321.
Cooperating group(s): University of Florida, Gainesville.
Publications: Probably will be presented to Council on Exceptional Children.

23-FA-5 FACTORS AFFECTING OBSERVATIONAL LEARNING IN PRESCHOOL CHILDREN

Purpose: To study the influence of the adult-child relationship upon the effectiveness of the adult as a model for children's imitative responses; to investigate the components of imitative responses as a function of the child's relationships with an adult; to obtain data on the child's "internal model" or representation of what he has reproduced from observation of the adult.
Subjects: Nursery school children.
Methods: Children assigned to experimental play groups; experimenter played a high nurturant or supportive role in half the groups and a less nurturant or unresponsive role in the other half. Experimenters performed a number of novel acts without specific directions to the children, and observational records were made of the children's imitative responses. Analyses and further experimentation explore factors which influence the child's responses and which account for his motivation to reproduce the adult's acts.
Duration: Not reported-1968.
Investigator(s): Marian Radke Yarrow, Ph.D., Chief, and Phyllis M. Scott, Ph.D., Visiting Associate, Section on Developmental Psychology, Laboratory of Socio-environmental Studies, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda, Md. 20014.

23-FA-6 STUDIES IN ALTRUISTIC BEHAVIOR

Purpose: To examine the antecedents and correlates of concern for others in children.
Subjects: Children in kindergarten through grade 6.
Methods: Children are exposed to an altruistic model in a charity-giving context, and their behavior on the model's departure is assessed in relation to antecedent and concomitant conditions.
Findings: Observation of a model facilitates altruism in children. Altruism is age-contingent. Teachers' ratings of obedience and helpfulness correlate with experimental behaviors.
Duration: March 1968-August 1972.
Investigator(s): David L. Rosenhan, Ph.D., Professor of Psychology, Swarthmore College, Swarthmore, Pa. 19081.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: In New Directions in Developmental Psychology, P. H. Mussen (Ed.). New York: Holt, Rinehart & Winston, in press, 1968; Journal of Personality and Social Psychology, 1967.

23-FA-7 CHILDREN'S PLAY AS AN INDEX OF DEGREE OF SOCIALIZATION

Purpose: To compare the developmental pattern in play demands for social interaction in various cultures and subcultures.
Subjects: Children, ages 5 to 11.
Methods: A scale and report form, extrapolating from Sullivan's theory of interpersonal development, were developed and standardized separately for boys and girls in suburban middle class Santa Monica, Indianapolis, and Boston. Comparable urban and rural samples were gathered in Oslo, London, Madrid, Athens, and Cairo to test democratic-authoritarian cultures. Comparable samples of handicapped, gifted, and disadvantaged children are being gathered to shed light on their social problems.

BEST COPY AVAILABLE

Findings: Marked sex, age, rural-urban, and national differences in terminal level in America and Japan.
Duration: 1967-1969.
Investigator(s): May V. Seagoe, Ph.D., Professor of Education, University of California, Los Angeles, Calif. 90024.
Cooperating group(s): Chancellor's Ford Comparative Education Project.

23-FE-1 QUESTIONING AND ANSWERING BEHAVIOR OF PRIMARY AND SECONDARY SCHOOL CHILDREN

Purpose: To expose socially based variations of curiosity, its verbal expression, and the perceived adequacy of different answers, and to specify the social psychological antecedents of differences in these areas.
Subjects: Random samples of 5-, 10-, and 15-year-old children; specially selected subsamples to allow a specification of sex, social class, and I.Q. differences.
Methods: Controlled observations of parent-child and teacher-child interaction, questionnaires, experimental situations.
Duration: 1967-1971.
Investigator(s): W. P. Robinson, D. Phil., Lecturer, Department of Psychology, The University, Southampton, England.
Cooperating group(s): Joseph Rowntree Memorial Trust; Schools Council; Ford Foundation.
Publications: Answers to Questions, W. P. Robinson and S. J. Rackstraw. London: Routledge and Kegan Paul, Ltd., 1969; Language and Speech 10, 1967; Sociology 1, 1967.

SPECIAL GROUPS OF CHILDREN

Physically Handicapped

23-GA-1 ENVIRONMENTAL AND HEREDITARY INFLUENCES IN THE ETIOLOGY OF CONGENITAL MALFORMATIONS IN SOUTH WALES

Purpose: To study environmental and genetic influences of etiological importance in the congenital malformations of a birth population in South Wales; to provide material for cohort studies of representative samples of normal and defective children in relation to their social and educational needs.
Methods: Identification of all congenital malformations in the birth population of South Wales over a four-year period; examination of incidence of specific malformations in relation to district and season, and to ethnic group, age, reproductive history, and socioeconomic status of parents.
Duration: 1963-1966.
Investigator(s): C. R. Lowe, M.D., D.P.H., Professor, and I. D. G. Richards, M.D., Lecturer in Social Medicine, Department of Social and Occupational Medicine, Welsh National School of Medicine, The Parade, Cardiff, Wales.
Cooperating group(s): Association for the Aid of Crippled Children.

23-GA-2 REVIEW AND ANALYSIS OF PROGRAMS AND SERVICES FOR CHILDREN AND YOUNG ADULTS WITH HEART DISEASE IN MICHIGAN

Purpose: To provide information that will be useful in planning and implementing improved heart disease control programs in Michigan.
Subjects: All resources and facilities in Michigan that provide care for children and young adults with heart disease.
Methods: A preliminary study of services will be made by consulting reports of the Division of Services for Handicapped Children and other sources of hospital data on utilization of medical services. Once services have been identified, they will be visited. As part of the inventory of services, local health officers will be visited in the five regional areas served by the Michigan Heart Association. In addition, a random selection of hospitals not observed in person will be asked to respond to a questionnaire.
Duration: August 1967-June 1969.
Investigator(s): Donald C. Smith, M.D., D.P.H., Professor of Maternal and Child Health, Department of Health Development, University of Michigan School of Public Health, Ann Arbor, Mich. 48104.
Cooperating group(s): Michigan Department of Public Health; Michigan Heart Association.
Publications: Results and recommendations will be published in an appropriate scientific journal.

23-GA-3 EPIDEMIOLOGY OF HEAD INJURIES IN CHILDREN: A PROSPECTIVE STUDY

Purpose: To study the natural history of head injuries in children resulting from accidents, and to understand the phenomenon of traumatic head injuries by documenting and establishing relationships between the host, environment, and agent.
Subjects: Children, ages 3 to 15, visiting the Emergency Department of Vancouver General Hospital for investigation of head injuries; control subject matched to each injured child for age within three months, sex, I.Q., geographic location, socioeconomic status, and school class.
Methods: The study takes into account the following classes of variables: (1) demographic information on family and child; (2) intelligence and social maturity of child; (3) previous history of disabling conditions; (4) detailed information on the accident, the site, cause, etc.; (5) medical findings, including state of consciousness; (6) severity of head injury; (7) other injuries sustained; (8) diagnostic procedures and treatment, including radiographs; (9) disposition; (10) reactions of parents and child to the head injury; (11) history of previous head injuries or other accidents; (12) followup to determine sequelae.
Duration: April 1968-1970.
Investigator(s): H. Klonoff, Ph.D., Associate Professor and Head, Section of Psychology, Department of Psychiatry, and G. C. Robinson, M.D., Associate Professor, Department of Pediatrics, University of British Columbia; H. S. Miller, M.D., Director, Emergency Department, Vancouver General Hospital; and G. A. Mott, M.D., D.P.H., Deputy Medical Health Officer, Vancouver Health Department, Vancouver, B.C., Canada.
Cooperating group(s): Vancouver School Board; Metropolitan Health, Vancouver Federal Health Grants, Ottawa, Canada.
Publications: Canadian Medical Association Journal 96:1308-1311, May 13, 1967.

23-GB-1 AN ECONOMICAL TEST FOR SCREENING CHILDREN AND ADULTS WITH OVERT AND COVERT CEREBRAL DYSFUNCTIONS SECONDARY TO BRAIN LESIONS

Purpose: To develop an instrument to detect and define brain lesions where the evidence of such lesions is covert as well as overt.
Subjects: 4,000 children, ages 8 to 17: 3,680 in classes for normal children, and the rest in special classes for the educable mentally retarded, brain damaged, and emotionally disturbed.
Methods: A Symbol-Digit Modalities Test (substitution of numbers for geometric figures) was developed and standardized in written and oral responses by all subjects. Data were analyzed and norms prepared. The SDMT was routinely included in neuropsychological test batteries administered to over 1,000 children and adults with suspected and verified brain lesions.
Findings: Norms showed significant differences in normal children according to age and sex. The Symbol-Digit Modalities Test appears to be an exceedingly sensitive and effective, as well as an economical tool both for screening cases with covert and unsuspected early brain damage, and for defining the nature of defects, especially when used in conjunction with other neuropsychological tests.
Duration: 1964-1970.
Investigator(s): Aaron Smith, Ph.D., Associate Professor, Speech Clinic, University of Michigan, Ann Arbor, Mich. 48104.
Cooperating group(s): Omaha, Neb. Public Schools; Omaha Veterans Administration Hospital; Department of Neurology, University of Michigan.
Publications: Educational and Psychological Measurement, December 1967; Learning Disorders, 1967; the SDMT is scheduled for publication and distribution by Western Psychological Services.

23-GB-2 BEHAVIORAL CLASSIFICATION FOR THE HANDICAPPED

Purpose: To develop data previously collected in order to test statistically an objective classified system based on previous and present study. The present investigation is based on recently defined rating scale batteries, the Central Wisconsin Colony Scales of Adaptive Behavior, which employ a number of fine scale units to discriminate the behavior of the children.

Methods: Used multidimensional scaling and factor analytic studies after the methods of Kaiser and Torgerson to develop factor scores and profiles for classification purposes.

Findings: Factor rotations and computer runs on CDS 1604 have been completed. Data are now being processed.

Duration: June 1967-August 1968.

Investigator(s): Earl E. Balthazar, Ph.D., Research Scientist and Chief, Research Department, Central Wisconsin Colony and Training School, 317 Knutson Dr., Madison, Wis. 53704.

Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

Publications: Plan to publish in an appropriate journal; information available on preliminary studies.

23-GB-3 COMPUTERIZED OBJECTIVE AUDITORY TESTING IN INFANCY

Purpose: To evaluate the use of an average response computer in testing infants suspected of deafness prior to the time when standard audiometric test methods are applicable.

Subjects: Infants from a high risk group where deafness is suspected, most of whom are under age two, with a majority under age one; control group of 10 normal infants.

Methods: Subjects are tested through vertex recordings with tone bursts of 500 Hz and 2,000 Hz delivered at five-second intervals. Initial intensity level is 50 dB H. L. with on-line computing determining subsequent levels. Subjects will be followed regularly until an accurate determination of hearing can be confirmed by routine means.

Duration: July 1966-June 1969.

Investigator(s): Victor Goodhill, M.D., Professor of Surgery in Residence, Center of Health Sciences, University of California, Los Angeles, Calif. 90024.

Cooperating group(s): Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.

23-GC-1 CORRELATES OF BIRTH ORDER IN NORMAL AND ASTHMATIC CHILDREN

Purpose: To assess effects of birth order on respiratory and cardiac response to stress in normal and asthmatic males; to study the relationship between birth order and report of the role of emotion in asthma; to assess the relationship between birth order and effect of institutionalization on symptom status of asthmatic children.

Subjects: 14 first-born and 15 later-born males, ages 12 to 15; 5 first-born and 14 later-born asthmatic males, ages 12 to 15; 36 female and 31 male asthmatics; 258 asthmatics.

Methods: Measurement of cardiac and respiratory response under conditions of rest, tones, shock, mental arithmetic, and mental arithmetic and criticism; a structured "precipitants" interview in which the child reports, in order of importance, the precipitants that gave him asthma at home; assessment of change in symptom status following institutionalization at Children's Asthma Research Institute and Hospital.

Findings: No respiratory differences were found between birth order groups of normal males under any conditions, but the first-born were found to have significantly higher heart rates under all conditions. Tentative findings on the asthmatic boys indicate no heart rate differences under any conditions, but the first-born had higher respiratory rates under all conditions. First-borns reported emotions to be more important precipitants of their asthma. First-borns are over-represented in the group at CARIH that shows dramatic improvement.
Duration: Summer 1966-not reported.
Investigator(s): Jonathan H. Weiss, Ph.D., Chief, Clinical Psychology, Children's Asthma Research Institute and Hospital, Denver, Colo. 80204.
Cooperating group(s): Sigma Xi.
Publications: Paper to be submitted to Journal of Personality and Social Psychology; paper presented at American Psychological Association Meeting, Washington, D. C., 1967.

23-GC-2 BEHAVIORAL STUDY OF CHILDREN WITH CONGENITAL RUBELLA

Purpose: To determine the special behavioral and intellectual consequences of congenital rubella; to use these findings to enhance the effectiveness of the treatment and education of children with this condition; to generalize findings for use of professional workers concerned with children with congenital rubella or those with multiple handicaps resulting from other causes.
Subjects: Three-year-old children: 246 with congenital rubella; 90 without obvious congenital defects whose mothers also had rubella during pregnancy; group of normal children.
Methods: Subjects undergo behavioral, psychiatric, and developmental evaluations. Findings of the first two groups will be compared with one another and with findings from the group of normal children.
Duration: 1967-continuing.
Investigator(s): Stella Chess, M.D., Associate Professor, John F. Donohue, M.D., Attending Psychiatrist, Becky Adelson, D.S.W., Supervisor of Psychiatric Social Service, and Paulina Fernandez, Ph.D., Psychologist, Department of Psychiatry, New York University Medical Center, New York, N. Y. 10016.
Cooperating group(s): Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.

23-GC-3 DISEASE AND EDUCATION IN ST. LUCIA

Purpose: To evaluate the influence of Bilharzia on the scholastic performance of St. Lucian (West Indies) school children.
Subjects: Children attending Standard VI and Form II and comprising those age levels with the highest prevalence of Bilharzia.
Methods: Children were tested for reading comprehension and vocabulary, and data were derived on basic ethnographic information. A 10 percent systematic sample was selected to supply stools on which tests for Bilharzia and other nonamoebic parasitic diseases were performed.
Duration: 1968-1970.
Investigator(s): Erwin H. Epstein, Ph.D., Assistant Professor, Department of Educational Policy Studies, University of Wisconsin, Madison, Wis. 53706.
Cooperating group(s): Rockefeller Foundation.
Publications: Indefinite.

23-GC-4 SPEECH READING FAILURE IN DEAF CHILDREN

Purpose: To investigate the psychological and neurological processes which result in the failure of the multiply handicapped child to develop speech reading skills; to study the relationship of aphasia for speech reading to the development of other language processes; to develop remedial techniques for children with this type of disability.
Subjects: 60 deaf children, ages four to nine; experimental group consisted of children in a training program who have been unable to develop speech reading and language skills expected for their ages.
Methods: Subjects were given a battery of psychological tests providing diagnostic data on those children who were unable to develop competency in speech reading, and data concerning the various reasons for failure to develop the skills. Remedial techniques were attempted with the experimental group.
Duration: December 1966-August 1968.
Investigator(s): Arthur I. Neyhus, Ph.D., Associate Professor, Institute for Language Disorders, Northwestern University, Evanston, Ill. 60201.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

23-GC-5 SOCIAL-PSYCHOLOGICAL IMPLICATIONS OF DISCREDITABLE STIGMATA

Purpose: To examine the self-other orientation of children with Turner's syndrome.
Subjects: 10 girls with Turner's syndrome; 45 controls.
Methods: Subjects were tested with Ziller's Self-Other Orientation Tasks, a topological method of measuring self-esteem, social interest, and complexity of the self-concept.
Findings: Turner's syndrome is associated with lower self-esteem and social interest.
Duration: Not reported.
Investigator(s): Lynn H. Golding, M.A., Research Assistant, and Robert C. Ziller, Ph.D., Professor of Psychology, University of Oregon, Eugene, Ore. 97403.
Cooperating group(s): National Science Foundation.
Publications: Submitted to Journal of Abnormal Psychology.

23-GD-1 CAUSES OF VISUAL IMPAIRMENT OF PRESCHOOL AGE CHILDREN

Purpose: A study conducted in 1950 indicated that retrolental fibroplasia was responsible for blindness in approximately 50 percent of all blind preschool children. Today, RLF has been practically eliminated as a cause of blindness in infants. This study attempts to investigate the present causes of blindness and vision impairment among infants and preschool children; specifically, to determine (1) what other major changes have occurred since 1950, (2) whether there are other causes of blindness or severe vision impairment that now present a significant threat to young children, (3) whether there are significant changes in the incidence of blindness among this group, and (4) the incidence and causes of less severe vision impairments than blindness.
Subjects: All children born between January 1, 1959 and December 31, 1966, and known to agencies providing services to preschool children who are visually impaired (legally blind or partially seeing).
Methods: Attempts are being made to secure case records of all subjects. State agencies maintaining a register of these children and/or providing

services are requested to provide the National Society for the Prevention of Blindness with case records, including an eye examination report and data pertaining to age, sex, remaining visual acuity, and cause of impairment. Where this information is not available from state agencies, local agencies will be contacted. Data will be coded according to standard procedures and summarized for analysis.
Duration: September 1967-December 1968.
Investigator(s): Elizabeth M. Hatfield, M.P.H., Consultant in Statistics, National Society for the Prevention of Blindness, Inc., 79 Madison Ave., New York, N. Y. 10016.
Cooperating group(s): State and local agencies.
Publications: To be published in Sight-Saving Review, quarterly journal of the National Society for the Prevention of Blindness.

23-GD-2 NEUROPSYCHOLOGICAL ASSESSMENT OF BRAIN-DAMAGED CHILDREN

Purpose: To evolve reliable and valid neuropsychological tests with which to identify the organic deficits associated with various types of brain damage in young children and early adolescents, and to document the natural history of head trauma in children by a prospective, longitudinal, multidisciplinary approach.
Subjects: Children, ages 3 to 15, with acute head injury, chronic brain damage due to infectious disease, or minimal brain damage with no known etiology; normal children matched on a one to one basis.
Methods: A medical-neurological examination and neuropsychological examination using Halstead (Reitan) Battery, Benton Tests, and WISC are made of all children, and an EEG taken on those with acute head injury and minimal brain damage. Those with head injury are reexamined at yearly intervals for five years, and those with chronic and minimal brain damage reexamined once. The normal children are reexamined depending on the clinical groups to which they are assigned.
Duration: April 1965-1970.
Investigator(s): H. Klonoff, Ph.D., Associate Professor and Head, Section of Psychology, Department of Psychiatry, G. C. Robinson, M.D., Associate Professor, Department of Pediatrics, and G. B. Thompson, M.D., Assistant Professor and Head, Division of Neurosurgery, Department of Surgery, University of British Columbia, Vancouver, B.C., Canada.
Cooperating group(s): General Hospital, St. Paul's Hospital, Vancouver; Department of National Health and Welfare of Canada.
Publications: Developmental Medicine and Child Neurology, in press, 1968; article submitted for publication.

23-GE-1 AUTOMATED BEHAVIOR THERAPY FOR SENSORIMOTOR PERFORMANCE DISABILITIES IN HANDICAPPED CHILDREN

Purpose: To provide children suffering motor performance deficits with regulated exercises that encourage high levels of performance output on tasks requiring body movements specific to the nature of their disabilities; to meet this objective with automated procedures subjects can operate independently without constant supervision and intervention of a therapist; to make detailed records of performance in order to chart progress in treatment from session to session; to investigate changes in performance over time as a function of reinforcement contingencies, response requirements, and disability; to investigate new procedures for use with subjects whose disabilities have not hitherto been amenable to exercise therapy procedures.

Subjects: School children in special education programs; clinical inpatients and outpatients in rehabilitation settings.
Methods: An automated behavior analysis system provides audiovisual and/or token reinforcement for "correct" responses on a variety of response devices that require specific manipulative or other body control functions for successful performance of sequential operants. Response tasks are graded according to level of difficulty and nature of disability. Therapist records detailed performance data at conclusion of each session and modifies feedback programs and task requirements in successive sessions according to subjects' changing levels of performance capability.
Findings: Moderately and severely retarded children between C.A. 3.5 and 12 years with specific disabilities of manipulation and grasp demonstrated significant differences in performance accuracy between age levels and diagnostic groups; selected subpopulations of Down's syndrome cases showed significant performance improvements across sessions. Preliminary findings with rehabilitation patients suggest higher levels of performance output and accuracy than previously encountered with other exercise therapy procedures.
Duration: September 1967-indefinite.
Investigator(s): Bernard Z. Friedlander, Ph.D., Research Psychologist, Department of Rehabilitation Psychology, University of Wisconsin, Madison, Wis. 53706.
Cooperating group(s): Orchard School for Special Education, Skokie, Ill.; Neurological and Rehabilitation Hospital, University Hospitals, Madison, Wis. 53706.
Publications: American Psychologist 22:7:589, 1967; papers to appear in psychological and rehabilitation journals.

23-GE-2 TRAINING IN VISUAL PERCEPTION FOR YOUNG DEAF CHILDREN TO STIMULATE SCHOOL READINESS

Purpose: To study the effectiveness of a visual training program in stimulating and accelerating the progress of young deaf pupils in speech reading, reading words and object association, and speech; to determine whether there is apparent lasting carryover value from the training; to prepare classroom materials that may be used to develop visual perception skills.
Subjects: Two beginner classes of deaf children, the majority of whom are from culturally and economically disadvantaged families and have had inadequate preparation for participation in a school learning situation.
Methods: Prior to training sessions, all children were given a battery of tests including learning aptitude and visual discrimination tests. One-half of the pupils in each class were then given individual vision perceptual training for 10 weeks; the remaining subjects received individual training for the second 10-week period, during which time the first group was given no additional training. At the end all children were retested and, after a period of time, the complete test battery was readministered. Test results were analyzed to determine whether there were gains in learning aptitude scores and visual dissemination, and whether any gains noted immediately after the training seem to be retained over a period of time. In addition, records of classroom performance and behavior were analyzed.
Duration: Completed.
Investigator(s): Rachel F. Rawls, M.S., Director of Research, The Governor Morehead School, 301 Ashe Ave., Raleigh, N. C. 27606.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

23-GE-3 VISUALLY DISCRIMINATED BEHAVIOR IN A "BLIND" ADOLESCENT RETARDATE

Purpose: To establish visually discriminated behavior in a boy diagnosed organically blind: to evaluate his visual acuity in the laboratory, and to determine the extent to which he would use vision when the environment outside the laboratory supported such behavior; to train him to fixate the eyes of other persons, and to test the generality of any learning of this response.
Subjects: Retarded 16-year-old male, diagnosed organically blind, institutionalized for 16 months prior to study.
Methods: The boy was given food and praise for correct choices in a two choice discrimination task where the correct choice could be determined only from visual cues. As performance improved, the size of stimuli was decreased. He was reinforced for eye fixation following instructions to look at the experimenter; for a few sessions he was reinforced for any behavior other than fixation. In the cafeteria, previously available help in obtaining food items was withdrawn, and only briefly reinstated. He was trained to eat appropriately following the experimenter's instructions and verbal praise and punishment.
Findings: He was able to respond discriminatively to stimuli as small as 18 point type at better than chance level. He was trained to look at the experimenter's eyes when instructed to do so; control procedures revealed that the reinforcement contingency functioned to establish and maintain this behavior. Generalization was limited. He learned to help himself in the cafeteria.
Duration: April-August 1967.
Investigator(s): Stephanie B. Stolz, Ph.D., Director of Research, Jewish Foundation for Retarded Children, 6200 Second St., N. W., Washington, D. C. 20011; and Montrose M. Wolf, Ph.D., Associate Professor of Psychology, University of Kansas, Lawrence, Kan. 66045.
Cooperating group(s): Kansas Neurological Institute; Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: To be submitted to Journal of Applied Behavior Analysis, 1968.

23-GE-4 THE DEVELOPMENT OF SPEECH COMMUNICATION SKILLS IN DEAF INFANTS THROUGH THE USE OF LOW FREQUENCY AMPLIFICATION

Purpose: To investigate the extent to which normal patterns of development, particularly of speech communication skills, can be promoted in infants born with impaired hearing.
Subjects: Newborns in maternity hospitals, infants attending well baby clinics, and children referred by pediatricians; controls.
Methods: Hearing tests are administered, and rehabilitation measures, including low frequency amplification, are initiated as soon as deafness is diagnosed. Some relationships between the duration of sensory deprivation (birth to beginning of training) and development will be examined. Subjects and normally hearing controls will be periodically evaluated to fourth birthday, if possible. Primary data obtained from an observation schedule, tape recordings of speech and vocalization, objective measures of speech-sound discrimination, schedules of behavior development, and data from regular, psychiatric, pediatric, otologic, and audiologic examination will be collected and evaluated.
Duration: April 1966-March 1971.
Investigator(s): Daniel Ling, M.Sc., Director, Project for Deaf Children, McGill University, and Hollie E. McHugh, M.D., Institute of Oto-Laryngology, McGill University and Royal Victoria Hospital, Montreal 25, Quebec, Canada.
Cooperating group(s): Canadian National Health grant; Junior League of Montreal.

Publications: Volta Review, 1968; American Annals of the Deaf, February 1968; Journal of Auditory Research, 1967; others. Final report planned in 1971; interim articles, publications, and information available from Mr. Ling.

23-GE-5 HOME TEACHING FOR PARENTS OF YOUNG DEAF CHILDREN

Purpose: To explore and evaluate the feasibility of providing language instruction to parents of deaf children in a home-like environment rather than a clinic or school setting.
Subjects: 52 deaf children and their parents.
Methods: Children were accompanied by parents on 10 weekly visits to a simulated home setting, where teachers trained parents to incorporate communication training in their own household activities. Parents were encouraged to bring in materials from their own homes, and lessons involved common tasks such as ironing clothes, preparing lunch, or vacuuming the floor. In addition, parents attended evening classes.
Findings: Concept of home teaching has received widespread dissemination.
Duration: September 1964-August 1967.
Investigator(s): Edgar L. Lowell, Ph.D., Administrator, John Tracy Clinic, 806 W. Adams Blvd., Los Angeles, Calif. 90007.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Copies of final report on file at John Tracy Clinic.

23-GE-6 GROUP WORK WITH MOTHERS OF SPINA BIFIDA CHILDREN

Purpose: To assess mutual problems of families with a spina bifida child; to ascertain whether group work is an efficient and/or helpful method of assisting these families; to attempt to learn how the children react to each other.
Subjects: Three mothers, ages 20 to 30, whose first child had spina bifida.
Methods: Mothers were interviewed individually and in a group, and interviews were recorded at length to enable evaluation of observed changes throughout duration of project. Children received physiotherapy together.
Findings: There were a number of mutual problems which encouraged the mothers not to see their children as "different", and to participate in the group. Group work proved an efficient and helpful method of dealing with these problems. Children reacted well together and encouraged one another.
Duration: November 1966-March 1968.
Investigator(s): Sheila Smith, M.A., Senior Medical Social Worker, Royal Aberdeen Children's Hospital, Aberdeen, Scotland.
Cooperating group(s): Physiotherapy Department, Royal Aberdeen Children's Hospital.
Publications: Results available from Mrs. Smith.

23-GE-7 MINIMAL BRAIN DYSFUNCTION IN THE HILO CLINIC

Purpose: To evaluate work done with patients diagnosed as having minimal brain dysfunction.

Subjects: Children, ages 4 to 18, referred to the Mental Health Services Clinic beginning in 1960 with problems of behavior and/or lack of academic progress.
Methods: Patients' records are analyzed, and statistical attempts are made to arrive at causal categories and treatment results.
Findings: Medical and psychotherapeutic types of treatment seem to be successful.
Duration: February 1968-December 1969.
Investigator(s): Mildred C. Mendenhall, Ph.D., Clinical Psychologist (Retired), State Mental Health Services, Hilo, Hawaii 96720.
Publications: Results will be available from Dr. Mendenhall or the Hilo Clinic after 1969.

23-GE-8 AN EXPERIMENT IN COMPREHENSIVE SERVICE TO PARENTS OF EXCEPTIONAL PRESCHOOL CHILDREN

Purpose: To provide informational and counseling services to parents of preschool exceptional children in an effort to create a more favorable family environment and to encourage increased parental participation in the educational and therapeutic program of United Cerebral Palsy of Queens.
Subjects: Parents who have enrolled their children in the agency's preschool program.
Methods: Parents are required to devote two half-days per week to parent-centered activities such as attendance at lectures concerning child development and exceptional children, participation in therapeutic group meetings, attendance at monthly evening review conferences, individual casework and psychological counseling, and serving as classroom aides to disabled children under professional supervision. A visiting nurse service assists parents in transferring knowledge gained from these activities to the home situation.
Duration: Not reported.
Investigator(s): Daniel Wieder, M.A., Executive Director, United Cerebral Palsy of Queens, 82-25 164th St., Jamaica, N. Y. 11432.
Cooperating group(s): Association for the Aid of Crippled Children.

23-GE-9 PERCEPTUAL-MOTOR TRAINING GROUP

Purpose: To enhance perceptual-motor integration of cerebral palsied children.
Subjects: Children, ages 7 to 11.
Methods: Small groups of five to seven children each meet for 30 minutes twice a week for group activities planned and guided by two occupational therapists. Group activities are followed up in classroom settings and in some cases in individual treatment. Carryover in these areas is assessed.
Findings: Most of the children in these groups have made measurable gains.
Duration: February 1967-June 1968.
Investigator(s): Geraldine Seeber, B.S., O.T., and Carolyn Ayres, B.S., O.T., Staff Occupational Therapists, Richmond Cerebral Palsy Center, 1308 Sherwood Ave., Richmond, Va. 23220. (Reported by Inge W. Horowitz, OTR, Treatment Program Coordinator, Richmond Cerebral Palsy Center.)
Cooperating group(s): School of Occupational Therapy, Virginia Commonwealth University, Richmond, Va. 23220.

Publications: A 20-minute silent black and white film depicting a sampling of some of the activities used in group play was shown and discussed at a Washington, D. C. Occupational Therapy Association Workshop, September 1968.

23-GE-10 AUTOMATED LANGUAGE TESTS AND ENRICHMENT FOR DEAF INFANTS

Purpose: To investigate the nature of receptive language deficits, the effects of amplification on listening experience, and the effect of systematic training in audio and language perception on listening performance in infants and young children with a severe hearing loss.
Subjects: Children known to have severe hearing deficits.
Methods: Automated devices which have been proven useful in evaluating listening preferences in normal infants and in institutionalized children with diffuse moderate hearing disability are adapted, by means of a tape recorded closed circuit television and stereo audio, to an evaluation of listening performance and the enrichment of listening opportunities in subjects. Integrated program combining these instruments and carefully designed preschool activities provides a research framework for determining the effectiveness of enrichment treatment.
Duration: September 1968-continuing.
Investigator(s): Bernard Z. Friedlander, Ph.D., Research Psychologist, Department of Rehabilitation Psychology, and Claude S. Hayes, Ph.D., Chairman, Department of Communicative Disorders, University of Wisconsin, Madison, Wis. 53706; Spiro B. Mitsos, Ph.D., Executive Director, The Rehabilitation Center, Evansville, Ind.
Cooperating group(s): Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.

23-GF-1 SOCIAL CLASS DIFFERENCES IN THE ATTITUDES TOWARD DISABLED CHILDREN

Purpose: To study whether the degree to which different types of disabilities threaten family status varies by social class; specifically, to test three hypotheses: (1) different social classes have different values; (2) the life chances of the different social classes are related to types of occupations customarily pursued by members of these classes, the type of training required, and general ways of adjusting to the social environment; and (3) a particular disability category frustrates the pursuit of the values of one class more than it frustrates the pursuit of values of another class.
Subjects: A general population sampling of 400, stratified by social class.
Methods: Groups of adults will be given a disability comparison questionnaire comparing attitudes toward mental retardation, speech defect, emotionally disturbed acting out behavior, emotionally disturbed withdrawn behavior, physical disability of arm, hand, or finger, disfigurement, or other physical disability. Subjects are known to belong to groups in which a high proportion of the membership is usually associated with a given social class. Analysis of responses will determine whether class-linked attitudes towards disabilities exist in the general population. Respondent's social class is identified by three separate methods.
Duration: August 1968-January 1969.
Investigator(s): Robert P. Overs, Ph.D., Research Coordinator, Curative Workshop of Milwaukee, 750 N. 18th St., Milwaukee, Wis. 53233.
Cooperating group(s): Easter Seal Research Foundation, National Easter Seal Society for Crippled Children and Adults.

Mentally Retarded

23-HB-1 BEHAVIORAL ASSESSMENT OF NEONATES AT RISK FOR MENTAL HANDICAPS

Purpose: To establish systematic observation procedures and behavioral measurement categories for earlier detection of neonates at risk for subsequently determined mental handicaps and/or mental subnormalities. To explore sensory-perceptual development in the early periods of life, the means by which the family reinforces perceptual "styles", and how they are manifested in personality and intellectual behaviors.
Subjects: Infants born at the National Naval Medical Center.
Methods: On the basis of information obtained from the National Naval Medical Center's Ob-Gyn record-keeping system, mothers will have been given a weighted probability for having a child "at risk" after delivery. Neonates selected for study will receive the first observational test sequences during the lying-in period. Subsequent observations will be made during outpatient visits to the Children's Diagnostic and Study Branch of the National Institute of Child Health and Human Development. A terminal evaluation, including neurological and audiometric examinations, will be made when the child is two years old.
Duration: 1967-1969.
Investigator(s): Adam P. Matheny, Jr., Ph.D., Department of Pediatrics, University of Louisville School of Medicine, Louisville, Ky. 40202.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.

23-HC-1 SOCIAL AND COMMUNICATION BEHAVIOR OF RETARDED ADOLESCENTS IN LABORATORY SITUATIONS

Purpose: To investigate communication, giving, and sharing in a two-person laboratory situation.
Subjects: Retarded children.
Methods: Two subjects are placed in a situation (modified, two-person Wisconsin General Test Apparatus) in which one subject (the operator) delivers various combinations of reinforcement to himself and to the other subject (the receiver). The operator can make one of two responses in giving, or sharing social situations. Giving or sharing is determined by whether he makes a response which delivers reward to the receiver. In the communication experiment, the operator can make one of four responses, but if the operator and receiver are to obtain more than a chance amount of reward, the receiver must communicate which response is to be made. Data are analyzed by both group and individual pair methods.
Findings: Retarded adolescents as a group deliver rewards to their peers when it does not cost them to do so. Receivers with relatively high language skills make more correct responses in the communication situation than do receivers with relatively low language skills.
Duration: 1960-1968.
Investigator(s): Joseph E. Spradlin, Ph.D., Parsons State Hospital and Training Center, Parsons 67357, and Bureau of Child Research Laboratory, and Frederic L. Girardeau, Ph.D., Coordinator, Research Training, Bureau of Child Research Laboratory, Children's Rehabilitation Unit, University of Kansas Medical Center, Kansas City, Kan. 66103.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: American Journal of Mental Deficiency.

23-HC-2 THE DEVELOPMENT OF THE SOCIAL CONCEPT GROUP AMONG MENTALLY RETARDED CHILDREN

Purpose: To investigate the understanding and concept of group activity among mentally retarded children to make possible more meaningful instruction.
Subjects: 120 mentally retarded and normal youths drawn from family and institutional settings and separated into three matched groups: retardates with an I.Q. of 50-65 and a mean chronological age of 12 years; normal children with a mean chronological age of six years; normals with a mean chronological age of 12 years.
Methods: Modified versions of the Thematic Apperception Test and projective tests were devised and administered. Interviewers observed and recorded the various activities of the subjects. Data were analyzed by scale analysis, product moment correlation, and analysis of variance procedures.
Duration: Completed.
Investigator(s): Lloyd Taylor, Ph.D., Phillips University, Enid, Okla. 73701.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

23-HC-3 CURIOSITY BEHAVIOR IN EDUCABLE MENTALLY RETARDED ADOLESCENTS--CHARACTERISTICS, MODIFIABILITY, AND EFFECTS OF TRAINING

Purpose: To examine characteristics of curiosity motivation in educable mentally retarded adolescents; to establish correlates of individual differences in curiosity behavior among retarded learners; to train incurious educable mental retardates for increased orientation towards complex and unfamiliar stimulus qualities; to study the effects of perceptual curiosity training.
Subjects: Educable mentally retarded and intellectually normal adolescents; incurious retarded adolescents.
Methods: Perceptual curiosity activity is studied in educable mentally retarded and normal groups through examination of preferences in contrasting two-choice stimulus sets; correlates of this choice are also assessed. Same or similar sets are used to train incurious retarded subjects in the choice of relatively complex stimuli. Effects of curiosity training are studied by examination of the relative effectiveness of intrinsic rewards on discrimination learning for trained and untrained subjects and examination for increased interest in unknown information among trained subjects.
Duration: Not reported-August 1968.
Investigator(s): Martin B. Miller, Ph.D., Graduate School of Education, Yeshiva University, New York, N. Y. 10003.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

23-HC-4 FACTORS RELATED TO SPEECH HEARING BY MENTALLY RETARDED CHILDREN

Purpose: To investigate the auditory behavior of mentally retarded children with respect to speech hearing ability; to study the relationships among test performance and selected measures of mental age, chronological age, I.Q., and physiological age.
Subjects: 200 children, ages 6 to 18, with I.Q.'s ranging from 60 to 90.
Methods: Subjects from the schools and institutions of Pennsylvania are tested for intelligence measures, physiological age, and speech hearing ability. Multiple factor analysis will be used to test for interaction among measures.

Duration: July 1968-January 1969.
Investigator(s): Bruce M. Siegenthaler, Ph.D., Director, Speech and Hearing Clinic, Pennsylvania State University, University Park, Pa. 16802.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

23-HC-5 A LONGITUDINAL STUDY OF INTELLIGENCE IN RETARDED INSTITUTIONALIZED CHILDREN

Purpose: To study the effects of continuous institutionalization on retarded children.
Subjects: Institutionalized retardates, ages 5 to 20.
Methods: Several hundred records of patients at a state home and training school are being analyzed. Changes in I.Q. and M.A. are correlated with length of institutionalization, age at first institutionalization, and type of diagnosis. In addition, specific cognitive test components will be related to the same factors.
Duration: September 1968-December 1969.
Investigator(s): A. I. Rabin, Ph.D., Professor of Psychology, Michigan State University, E. Lansing, Mich. 48823.
Publications: To be submitted to American Journal of Mental Deficiency.

23-HC-6 THE ODDITY CONCEPT IN SEVERELY RETARDED CHILDREN

Purpose: To study the oddity performance of severely retarded children of a given M.A. level, and to compare it to that reported for young normal children of the corresponding C.A. level by Gollin and Shirk (Child Development, 1966).
Subjects: All Central Wisconsin Colony residents who were reported to have an M.A. of three years or better at the time of their most recent psychological evaluation: 40 subjects with C.A.'s ranging from 7-1/2 to 43.
Methods: Subjects were tested individually, using an apparatus consisting of three windows in which red, blue, or green lights were displayed, with a response button below each. After a series of trials designed to acquaint subject with the apparatus, the three-choice, three-position oddity trials were begun with candy reinforcement given every time subject chose the odd color. Testing continued until subject reached a criterion of six consecutive correct responses, or to the maximum of 54 trials, counterbalanced for color and position of the correct choice.
Findings: No significant differences were found in the performance (number correct) of the M.A. 3 and M.A. 4 groups; differences between the M.A. 4's and the M.A. 5-and-above group were significant. C.A. was inversely related to performance; higher C.A. was also related to response perseveration. Performance of the M.A. 4 group was inferior to that of normal preschoolers (average C.A. = 4.2).
Duration: June-August 1967.
Investigator(s): Nolan E. Penn, Ph.D., Assistant Professor, Student Counseling Center, University of Wisconsin, Madison 53706; Ronald M. Sindberg, Ph.D., Research Director, and M. Judith Wohlhueter, M.A., Research Analyst, Central Wisconsin Colony and Training School, 317 Knutson Dr., Madison, Wis. 53704.
Publications: Accepted for publication in Child Development, 1969.

23-HF-1 PKU COLLABORATIVE STUDY

Purpose: To collect and evaluate the information on phenylketonuric children treated in the United States between 1960 and 1965 in an attempt to determine the value of the treatment more precisely; to identify chemical and other aspects affecting the results; and to provide information that can be the basis for standardization of treatment and evaluation.
Subjects: To date, information has been collected from private physicians and clinics throughout the country identifying 666 known phenylketonurics; additional patients and information are still being collected.
Methods: Information is collected from participating physicians through questionnaires and interviews and then processed by a system of numerical coding for computer usage and storage. Statistical analyses and recovery programs are performed.
Duration: July 1966-June 1969.
Investigator(s): W. Eugene Knox, M.D., Associate Professor of Biological Chemistry, Harvard Medical School, and Research Associate, Cancer Research Institute, New England Deaconess Hospital, Boston, Mass. 02115. (Reported by Kathryn T. Muller, Computer Coordinator, Cancer Research Institute.)

23-HF-2 COLLABORATIVE STUDY OF CHILDREN TREATED FOR PHENYLKETONURIA

Purpose: To increase knowledge and understanding of phenylketonuria; to evaluate all dimensions of the disease, including social factors, biochemical characteristics, and related cognitive abilities, with focus on the intellectual and physical consequences of treating phenylketonuric children with a low phenylalanine diet.
Subjects: Approximately 60 children per year from 11 states, identified through routine screening of all newborns as displaying the biochemical characteristics of phenylketonuria.
Methods: Children are randomly assigned to one of two treatment groups. Group I is composed of children for whom the serum phenylalanine level has been maintained between 1.0 and 5.5 mg. percent. Group II represents children maintained between 5.6 and 9.9 mg. percent serum phenylalanine. These two groups and their siblings and parents will be tested and evaluated over an eight-year period. An extensive schedule of assessment is planned, including frequent psychological, biochemical, social, and clinical determinations.
Duration: October 1967-October 1975.
Investigator(s): Richard Koch, M.D., and James C. Dobson, Ph.D., Coordinator, Division of Child Development, Children's Hospital, Los Angeles, Calif. 90027.
Cooperating group(s): States cooperating in this study are California, Colorado, Florida, Illinois, Iowa, Nebraska, New York, Oregon, Texas, Washington, and Wisconsin.
Publications: New England Journal of Medicine 278:21:1142-1144, May 23, 1968.

23-HG-1 PERSONALITY DEVELOPMENT IN DOWN'S SYNDROME

Purpose: To identify the crucial factors in the personality development of retarded children, particularly those with Down's syndrome.
Subjects: 20 in- and outpatients of Children's Hospital.
Methods: Currently being developed.
Duration: July 1968-June 1973.
Investigator(s): Leon Cytryn, M.D., Research Associate, Children's Hospital, Washington, D. C. 20009.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

23-HH-1 PROGRAMMED HABILITATION OF SEVERELY RETARDED CHILDREN

Purpose: To develop an effective total habilitation program for severely retarded children which will produce greater self-sufficiency and self-control and more productive and socially appropriate behavior than is currently being realized.
Methods: Experimentally examined and replicable procedures based on established psychological learning principles are applied by parents, attendant personnel, and teachers. Techniques are those that have been applied successfully to the behavior of psychotic children and adults and preschool normal children in field situations, and include behavior therapy, programmed instruction, and operant conditioning. Evaluation is contingent upon further development of reliable free-field measurement techniques and training nonprofessional personnel.
Duration: September 1965-August 1968.
Investigator(s): J. S. Birnbrauer, Ph.D., Assistant Professor of Psychology, University of North Carolina, Chapel Hill, N. C. 27514.
Cooperating group(s): Public Health Service, U. S. Department of Health, Education, and Welfare.

23-HI-1 THE DEVELOPMENT OF A PHYSICAL EDUCATION PROGRAM FOR TRAINABLE MENTALLY RETARDED CHILDREN AND YOUNG ADULTS

Purpose: To test the hypothesis that trainable mental retardates can benefit from organized physical education instruction; to plan a program and program materials to meet specific needs for social adjustment and motor ability development.
Subjects: Mental retardates, ages 6 to 30.
Methods: Subjects are divided into eight groups of ten each according to their scores on a devised motor ability test; the eight groups consist of two matched groups each of primary, intermediate, prevocational, and young adults. One-half of each of the four matched groupings receive the experimental treatment. Experimental and control group retest scores taken after treatment are analyzed, and teacher ratings after treatment interval are compared with ratings taken at the time of participant selection.
Duration: Not reported.
Investigator(s): Alice Pigman, Opportunity Center School, 215 - 21st Ave. S., Birmingham, Ala. 35205.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

23-HI-2 VOCATIONAL DEVELOPMENT OF MENTALLY RETARDED ADOLESCENTS

Purpose: To complete an earlier study of the vocational development of 14-year-old mental retardates, the effects of rehabilitation, and the identification of variables necessary for successful functioning as adults.
Subjects: Two groups of mentally retarded students.
Methods: Variables studied are self-concept, behavior in simulated work, intelligence changes, aspiration, and social behavior. Subjects are reassessed annually in a diagnostic work situation; psychological tests are administered, and interviews take place at home and work. Predictions for work situations are made between experimental and control group differences, and comparisons are made for the variables. All findings are cross-validated, and repeated measures allow for discussion of the developmental patterns of the variables for these subjects. Outline evaluations derived are structured cohesively for attainment.

Duration: 1965-not reported.
Investigator(s): Lee S. Shulman, Ph.D., Department of Counseling Personnel Services and Educational Psychology, College of Education, Michigan State University, E. Lansing, Mich. 48823.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

23-HJ-1 HABILITATION OF DISTURBED ADOLESCENT MALE RETARDATES

Purpose: To provide an intensive treatment program in Porterville State Hospital for emotionally disturbed adolescent retardates in an attempt to return them to the community.
Subjects: 42 emotionally disturbed male adolescent retardates.
Methods: Patients are divided into six groups of seven each. A highly organized closed environment is created in which as much behavior as possible may be programmed to yield immediate consequences for the subject; each patient will be individually programmed so that individual granting and withdrawal of rewards may be made contingent upon his behavior. It is anticipated that the repeated learning trials will eventually teach the asocial patient specific acceptable social skills and the realization that his behavior always yields consequences. The program will be evaluated through comparison of changes in patients' behavior before, during, and after treatment; further success will be reflected in the return of these individuals to the community.
Duration: June 1966-May 1969.
Investigator(s): James T. Shelton, M.D., Superintendent and Medical Director, and John C. Schoenherr, Ph.D., Chief Psychologist, Porterville State Hospital, P. O. Box 2000, Porterville, Calif. 93257.
Cooperating group(s): National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Mental Retardation 6:2:30-33, April 1968.

23-HJ-2 PSYCHOSOCIAL TREATMENT UNIT

Purpose: To establish a psychosocial treatment unit to prevent adolescent mentally retarded residents of White Haven State School and Hospital from becoming "institutionalized".
Subjects: Mentally retarded residents, ages 13 to 21, with an I.Q. of 50 or above and no serious physical or emotional impairments.
Methods: A psychosocial treatment unit has been established in which the residents' basic needs of acceptance, understanding, consistency, etc. are met through the utilization of cottage parents. A ward building was renovated to resemble a home setting as much as possible; programming is specialized to improve the residents' interpersonal relationships, to assist them in developing good work habits, and to help them become aware of job expectations. Emphasis is given to community activity. A group worker has primary responsibility in the unit, and with a mental health worker, recreation worker, consulting child psychiatrist, and clinical psychologist, plans a specialized program for each resident.
Duration: January 1967-December 1969.
Investigator(s): Francis P. Colizzo, M.D., Superintendent, Joseph J. Scartelli, M.S.W., Director of Social Service, and staff, White Haven State School and Hospital, White Haven, Pa. 18661.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

BEST COPY AVAILABLE

23-HJ-3 INTENSIVE SOCIALIZATION PROGRAM FOR MILDLY RETARDED

Purpose: To develop an interdisciplinary team consisting of a behavioral scientist, psychologist, social worker, community work specialist, and language specialist to implement socialization programs in an institution for the retarded.
Subjects: Groups of 60 mildly retarded residents each, including (1) adolescents manifesting socially disruptive behavior, (2) young adults assigned to an intensive rehabilitation program, and (3) young adults considered to be rehabilitation "failures" and/or "institutionalized".
Methods: Specific techniques of behavior modification are selected from areas of casework, group dynamics, counseling, operant conditioning, and special education. Emphasis will be on development of effective working relationships with families and community agencies, with particular focus on admission, predischarge, and postdischarge contacts. Professional staff will train and supervise attendants and volunteers. Results will be evaluated.
Duration: 1965-May 1970.
Investigator(s): Bill Doggett, Superintendent and Director, and Oliver Graebner, Ed.D., Psychologist and Codirector, Hospital Improvement Project, Austin State School, P.O. Box 1269, Austin, Tex. 78767.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

23-HJ-4 STUDY OF RESIDENTIAL CARE FOR SEVERELY SUBNORMAL CHILDREN

Purpose: To compare the traditional care of subnormal children, consisting of separately based residential and welfare services, with a comprehensive, community-based residential and welfare service.
Subjects: An experimental group of all severely subnormal children from two population areas of 100,000 who require residential care and who will be accommodated in community-based hostels; two control groups: subnormal children from two comparable population areas who remain in traditional institutions, and a comparable group of children living in their own homes.
Methods: Medical, psychological, developmental, and behavioral assessment of children's progress; social assessment of family problems; measurement of management practices of those caring for children, and of cost and administrative effort in the traditional and experimental services.
Duration: 1968-1972.
Investigator(s): Albert Kushlick, M.D., Senior Research Officer, Paul Williams, Gill Cox, and Elisabeth Gruber, Research Officers, Wessex Regional Hospital Board, Romsey Rd., Winchester, Hants, England.
Cooperating group(s): Medical Research Council; Institute of Education, London University.
Publications: Plan to publish.

23-HJ-5 INTENSIVE CARE OF YOUNG RETARDED CHILDREN AT WAIMANO

Purpose: To provide intensive care, treatment, and training to severely retarded young children in an institutional setting.
Subjects: 26 boys and 5 girls, multiply handicapped, ages 5 to 15, social quotient 8 to 46, and of multiracial background.
Methods: Each child was given a complete medical examination, followed by treatment and care by a multidisciplinary team. Next, each child was programmed according to his individual needs and capabilities. Training was conducted primarily in the areas of feeding, toilet training, ambula-

tion, dressing and undressing, speech, and socialization. The technique of choice was operant conditioning. An attempt was made also to work with parents of the children, and a parental attitude scale was developed.

Findings: All children improved in at least one area of training as measured by specific rating scales.

Duration: June 1968-May 1969.

Investigator(s): Garret H. Yanagi, Ph.D., Project Director, Hospital Improvement Project, Waimano Training School and Hospital, Pearl City, Hawaii 96782.

Publications: Annual report available from Dr. Yanagi.

23-HJ-6 PROGRAMS IN ADAPTABILITY TRAINING: TEACHING PARENTS TO WORK WITH THEIR CHILDREN

Purpose: To provide instruction, models, practice, and supervision so that parents can modify maladaptive behaviors in their children; to determine whether specific instruction in handling one behavior is transferred to handling other behaviors.

Subjects: Mentally retarded children under 10 years of age who are unable to cope successfully with the home or school environment; their parents.

Methods: Children are provided with programmed instruction based on a variety of psychological principles, including operant conditioning, modeling, and guiding of responses. Parents are given written booklets with programs and data collection pages. Followup interviews and objective assessment 6 and 12 months after training will determine effectiveness of approach.

Findings: Initial goals for change in children are met to preselected criterion level in 88 percent of cases. For the small number of cases past the six-month date, gains are maintained and parents generalizing.

Duration: September 1967-September 1970.

Investigator(s): Sue Allen Warren, Ph.D., Director, Psychology Department, and Herbert J. Grossman, M.D., Director, State Pediatric Institute, 1640 W. Roosevelt Rd., Chicago, Ill. 60608.

Cooperating group(s): Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.

Publications: Articles in preparation for journal publication.

23-HK-1 CHANGES IN PARENTAL EXPECTATIONS ABOUT THEIR RETARDED CHILD: EFFECTS DUE TO PARENTAL VARIABLES AND DIAGNOSTIC COUNSELING

Purpose: To study the accuracy with which parents view their retarded child's present behavior, the relationship between the parents' view of present behavior and future expectations, and how both the view of present behavior and future expectations are affected by diagnostic counseling.

Subjects: Families of children seen at the Children's Diagnostic and Study Branch of the National Institute of Child Health and Human Development.

Methods: Parental estimates and expectations of their child's abilities, problem areas, educational level, etc., are determined before and after the child is seen at the Diagnostic and Study Branch. Records are kept on the diagnostic counseling session showing relationships between dynamic exchange of information, invariant modes by which informational exchanges are made, and level of generality at which information is exchanged.

Duration: 1967-1969.

Investigator(s): Adam P. Matheny, Jr., Ph.D., Department of Pediatrics, University of Louisville School of Medicine, Louisville, Ky. 40202.

Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.

23-HK-2 PARENTAL ADAPTATION TO PHENYLKETONURIA

Purpose: To determine specific stresses of PKU which affect parental adaptation.
Subjects: 48 families of children diagnosed under age six as having PKU, under medical treatment, and living in their own homes.
Methods: Five scales were constructed to rate parents on (1) general adjustment to PKU, (2) existence of problems at time of diagnosis (level of family stability or coping capability), (3) level of dietary control, (4) level of effectiveness of parental cooperation with medical personnel, and (5) level of parental understanding of the disorder. Parents were interviewed in depth with a structured interview schedule in their own homes and data analyzed.
Findings: Parents generally made inadequate adaptations to PKU. Adjustments were directly related to the nature of parental responses to medical care. Dietary management tended to be positively associated with understanding of the disorder. The stress of the genetic information appears to be the crux of the intense diagnostic reactions. Two reaction patterns were identified according to the child's age at time of diagnosis.
Duration: December 1966-August 1967.
Investigator(s): Sylvia Schild, D.S.W., Assistant Professor, California State College, Los Angeles, Calif. 90032.
Cooperating group(s): Child Development Division, Children's Hospital of Los Angeles; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Article submitted to Pediatrics, May 1968; unpublished manuscript available through University Microfilms, University of Michigan, Ann Arbor.

23-HK-3 THE EFFECT OF DIFFERENCES IN CURRICULA AND EXPERIENCES ON SOCIAL WORK STUDENT KNOWLEDGE AND ATTITUDES ABOUT MENTAL RETARDATION

Purpose: To evaluate the impact of educational and life experiences on changing student attitudes toward the retarded as a client group, and to assess the relationship between cognitions, feelings, and behavior in this area.
Subjects: 567 beginning and graduating students selected at random from seven graduate schools of social work, purposively sampled according to variations in curriculum activity in mental retardation.
Methods: Data were collected through a series of self-administered instruments including a personal data sheet, semantic differential rating scales, knowledge inventory, and client preference rank order scale. Between- and within-group comparisons were computed with respect to knowledge, attitudes, and client preferences. Analysis was also made of the relationship between cognitions, attitudes, and action tendencies.
Findings: Cognitions, feelings, and action tendencies are not consistently related except at the extremes of the valence continuum. Knowledge derived through direct contact with retarded persons or their families involving affective experiences have greater impact on the changing of attitudes than knowledge alone. The sources of information (status, esteem, and competence of faculty) are further determinants in the absorption of new knowledge and its integration in attitudes. The introduction of contents on mental retardation in the basic generic curriculum of social work education does not materially affect the knowledge and attitudes of the general student body. Students in field instruction placements in agencies serving primarily retarded clients are most prone to attitude changes, which can be in either direction, but are most often positive.
Duration: April 1967-April 1968.

Investigator(s): Michael J. Begab, Ph.D., Head, Mental Retardation Research Centers Programs, National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda, Md. 20014.
Publications: Publication pending; copies will be available from Dr. Begab.

Emotionally Disturbed and Mentally Ill

23-JA-1 OBSESSIVE-COMPULSIVE CHILDREN

Purpose: To help diagnose and subsequently treat children who are obsessive-compulsive.
Subjects: Cases of children ages 10 to 18 reported in clinics and mental health units throughout Florida.
Methods: Children's case histories and files are read, and data about their parents, background, economic status, etc., are collected. Psychiatrists and residents in child psychiatry at the University of Florida College of Medicine are interviewed.
Duration: July 1967-July 1968.
Investigator(s): Paul Adams, M.D., Director, Division of Child Psychiatry, and Professor of Psychiatry and Pediatrics, and Valerie Ayer, B.A., Teaching and Research Assistant, J. Hillis Miller Health Center, University of Florida, Gainesville, Fla. 32601.
Publications: Paper planned.

23-JA-2 STUDY OF CHILDREN'S REACTIONS TO THE ROBERT F. KENNEDY ASSASSINATION

Purpose: To discover how a group of psychologically disturbed children perceived the events surrounding the Kennedy assassination; to elicit the nature of their reactions, and to determine whether certain factors such as age, sex, diagnosis, and parental response influence these reactions.
Subjects: 55 children, ages 4 to 17, who were therapy patients at an outpatient clinic at the time of the assassination; 36 parents who were being seen for related services at the same clinic.
Methods: A rating scale covering 24 dimensions of behavior, fantasy, and emotional reactions was scored by therapists during the therapeutic hour immediately following the assassination, and ratings were compared with ratings on the same dimensions during the therapeutic hour preceding the crisis. Children were interviewed during the postcrisis hour with open-ended questions designed to elicit the information regarding circumstances which provided them with their first knowledge of the crisis, their subsequent reactions, and responses of their families. An interview or telephone conversation with the parent covered the same areas as the child's semistructured interview.
Duration: June-December 1968.
Investigator(s): Bernice T. Eiduson, Ph.D., Director, Division of Research, Reiss-Davis Child Study Center, 9760 W. Pico Blvd., Los Angeles, Calif. 90035.
Publications: To be reported at California State Psychological Association Meeting, January 1969; publication to follow.

23-JB-1 AN INVESTIGATION OF LEARNING CORRELATES OF EMOTIONALLY DISTURBED AND SOCIALLY MALADJUSTED CHILDREN

Purpose: To determine and evaluate the relationships between categories of emotional disturbance and the learning characteristics of disturbed children.
Subjects: Disturbed and maladjusted boys, ages eight to ten, with conduct or personality problems or problems stemming from inadequacy-immaturity.
Methods: All subjects were given reading achievement and mental ability tests; a psychoeducational evaluation was made of selected subjects. Charting of longitudinal and cross-sectional-based learning characteristics, development of new training and teaching methods, and refinement of educational placement will be furthered with this research.
Duration: Not reported-July 1968.
Investigator(s): Paul S. Graubard, Ed.D., Department of Special Education, Yeshiva University, New York, N. Y. 10003.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

23-JB-2 ADOLESCENTS IN CRISIS

Purpose: To study family relatedness in crisis situations involving adolescents.
Subjects: Adolescents, ages 13 to 19, referred to McLean Outpatient Clinic; their families.
Methods: Individual intervention and family interviews. Crisis intervention is done either by individual interviews, mostly once a week, or by family interviews once a week. It is scheduled to last about four weeks. An individual interview with the adolescent and an interview with the parents are scheduled initially, followed by a family session with a family therapist. A reassessment and followup of the crisis take place after six months and one year. Family relatedness is assessed from the history and by means of a special questionnaire by three independent raters qualified in child psychiatry.
Findings: Family relatedness or family involvement in adolescent crisis seems larger than expected. The youngest in crisis is most often the oldest child or the oldest of one particular sex.
Duration: July 1967-July 1969.
Investigator(s): Jacob Christ, M.D., Psychiatrist in Charge, and Shirley Goldstein, M.S.S., Supervisor of Casework, McLean Outpatient Clinic, Richard Bonier, Ph.D., and Marvin Snider, Ph.D., Psychologists, John Spillane, M.D., and Irving Kaufman, M.D., Psychiatrists, McLean Hospital, Belmont, Mass. 02178.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Papers presented at meetings of American Psychological Association, 1968, and American Orthopsychiatric Association, 1969.

23-JB-3 PREDICTING ADOLESCENT PSYCHO- AND BEHAVIORAL PATHOLOGY

Purpose: To determine whether adolescents who are classified as behavioral deviants can be identified during the elementary school years.
Subjects: In 1960 Dr. Alan Goldfarb selected and studied a random sample of 514 third, fourth, and fifth grade children from Baltimore. (See Research Relating to Children, Bull. No. 12-O-11.) Ninety-three percent of this sample was located and is utilized in this study.

Methods: Elementary school variables (predictor) will be related to adolescent behavior (criterion) to determine their relative predictive value. Available elementary school variables include race, sex, teacher and psychiatrist evaluation of childhood behavior, school attendance, grade level, I.Q., standardized reading and mathematics scores, number of siblings, position in family, parents' education, number of marriages for mother, working status for mother, and parental supervision of child. High school followup variables include areas of achievement, such as I.Q. drop, reading and mathematics level drop, grade level drop, and low school grades, and areas of adjustment, such as school dropout, school special service record, juvenile court record, truancy, and high residential mobility. Predictive variables for each behavior will be identified, and a scoring system for them will be applied to the subjects to determine the sensitivity and specificity of the instruments. After validation, these instruments should assist future casefinders in identifying high risk elementary school children for referral.
Duration: September 1966-December 1968.
Investigator(s): Carl O. Helvie, M.P.H. (D.P.H. Candidate), Department of Mental Hygiene, Johns Hopkins University School of Hygiene and Public Health, Baltimore, Md. 21205. (Reported by Paul V. Lemkau, M.D., Professor and Chairman, Department of Mental Hygiene.)
Cooperating group(s): Maryland Public Schools; Maryland Psychiatric Case Register; Baltimore City and County Juvenile Court Systems; National Institutes of Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Doctoral dissertation at Johns Hopkins University School of Hygiene and Public Health; plan to publish results with Dr. Paul Lemkau.

23-JC-1 A PILOT STUDY OF SUICIDAL PATIENTS ADMITTED TO A STATE MENTAL HOSPITAL

Purpose: To establish a procedure for prompt identification of newly admitted suicidal patients in a state mental hospital; to develop an instrument with which nursing staff can obtain information for use in caring for these patients; to identify special needs of the patients for program planning in the hospital and community; to obtain epidemiological data on the populations at risk; to provide experience for nursing students and staff in practice-oriented research related to crisis-intervention.
Subjects: Patients of a wide age range whose admission to a state mental hospital was related to a suicide attempt; subgroup of adolescent patients.
Methods: Patients are interviewed and their charts analyzed. Special analysis is being made of adolescent patients.
Findings: Drug abuse seems to be involved in a large proportion of the adolescent suicidal patients, both in style of life and in method of suicide attempt.
Duration: September 1967-December 1968.
Investigator(s): Irving Babow, Ph.D., Research Social Scientist, Napa State Hospital, Imola 94558; Sylvia Bassett, R.N., and Ralph Matteoli, R.N., Assistant Professors of Nursing Education, Chico State College, Chico, Calif. 95927.
Publications: Report available from Dr. Babow; publication planned in a professional journal.

23-JD-1 A CONTROLLED STUDY OF SOME PSYCHOLOGICAL ASPECTS OF BEHAVIOR IN ASTHMATIC CHILDREN

Purpose: As part of a wider asthma epidemiological study: to investigate the level of aspiration of asthmatic children with the mother actively

participating, passively present, and absent, under both high and low stress conditions; to projectively assess the need for achievement; to investigate in both mother and child the reaction to unexpected separation; and to projectively assess the reaction to threat of separation, with special emphasis on determining if claustral regressive themes predominate in the asthmatic population.
Subjects: 50 mildly asthmatic children, ages 10 and 11, randomly selected from the Melbourne metropolitan area, and matched in pairs on seven variables with 50 controls. An asthmatic child is defined as having wheezed at some time in his life without evidence of infection.
Methods: The Rotter Level of Aspiration Board is employed with (1) the children seeing the result of each hit, and (2) the children being told their total score but visually unaware of the result of each hit. Under each condition, mother at one time assists the child in making aspiration estimates; at another, is present, but is occupied in another task; and at another time is absent. All conditions are randomized. Children are given a specially designed children's version of McClelland's technique for assessing the need for achievement, and an abbreviated form of Binet L. By written message, mother is requested to go to another room by herself and fill out a sentence completion test, while the child does the same test after not finding mother waiting as he expected. Finally the child does a Picture-Story Completion Test designed for this study, where the stimulus is threat of separation from mother, and opportunity is given for claustral regressive themes to be given as a response. After this stage of the research is complete, a group of severe asthmatics and a further control group of children with chronic chest infections other than asthma will be investigated with the same design.
Duration: October 1966-indefinite.
Investigator(s): John S. Williams, Senior Psychologist, Department of Psychiatry, Royal Children's Hospital, Melbourne, 3052, Australia.
Cooperating group(s): Clinical Research Department, Royal Children's Hospital Research Foundation.

23-JE-1 TREATMENT AND EDUCATION OF AUTISTIC CHILDREN--COMBINED APPLICATION OF CLINICAL AND LABORATORY METHODS

Purpose: To demonstrate how specific, theoretically based factors known to be successful in psychological laboratories can be applied to practical educational settings in the rehabilitation of severely autistic children.
Methods: A reactive environment was constructed specifically contingent on a child's performance to strengthen existing performances and successively approximate new ones from his current repertoire; other aspects of the milieu were deactivated to weaken some performances such as compulsive behavior, tantrums, and atavisms. First phase involved training of project personnel and planning and construction of experimental devices. Second phase involved modification of methods and experimentation using automatic devices with severely disturbed, nonverbal children and teaching machines, programmed instruction, and other reinforcement techniques in classrooms of more verbal children. Major results of experiment will be incorporated in a specification of the effective procedures which are discovered.
Duration: June 1965-June 1968.
Investigator(s): C. B. Ferster, Ph.D., Department of Psychology, Georgetown University, Washington, D. C. 20007.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

23-JF-1 CROSS-CULTURAL STUDIES OF FAMILIES OF SCHIZOPHRENICS

Purpose: To determine whether criteria for differentiating families of schizophrenics from other kinds of families apply cross-culturally and thus have generalized validity; to specify features of schizophrenics and their families which are and are not cross-culturally general; to study how variations in the sibling order of schizophrenics are related to cultural patterns of family life.
Subjects: Families of 320 Lebanese psychiatric inpatients, and normal control families; families of 21 late adolescent and young adult psychiatric patients and parents of a small number of childhood psychiatric patients in Japan.
Methods: Sibling data on Lebanese patients have been coded for computer analysis according to sex, age, religion, diagnosis, number of full and half siblings, plus sibling order in relation to both full and half siblings of each sex, both dead and alive. Psychological test protocols have been received from the Japanese subjects and are being translated and scored to be studied comprehensively.
Findings: Preliminary findings indicate that the scoring manuals developed in the National Institute of Mental Health research can be used with these highly diverse psychological test samples obtained in Lebanon and Japan.
Duration: Not reported-continuing.
Investigator(s): Lyman C. Wynne, M.D., Ph.D., and Margaret T. Singer, Ph.D., Family Studies Section, Adult Psychiatry Branch, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda, Md. 20014.

23-JF-2 SIBLINGS OF SCHIZOPHRENIC CHILDREN

Purpose: To compare children diagnosed as schizophrenic with their siblings with regard to developmental course, intellectual functioning, social skills and development, and neurological and pediatric function.
Subjects: Students enrolled in schools for disturbed children; their siblings.
Methods: Parent interview, psychological, pediatric, and neurological examination; examination of birth, pediatric, and school records.
Duration: November 1966-November 1968.
Investigator(s): Martin Gittelman, Ph.D., Director, Research and Psychological Services, Children's Mental Health and Research Center, League School for Seriously Disturbed Children, Brooklyn; Max Pollack, Ph.D., Senior Research Associate, Hillside Hospital, Glen Oaks; and Ruth Bakwin, M.D., Director, Department of Pediatrics, New York Infirmary, 321 E. 15th St., New York, N. Y.
Publications: To be published in 1969.

23-JF-3 STUDIES ON BIOLOGICAL AND ADOPTIVE PARENTS AND OFFSPRING IN RELATIONSHIP TO SCHIZOPHRENIA

Purpose: To evaluate the relative roles of heredity and environment in the etiology of schizophrenic syndromes.
Subjects: Adopted offspring of schizophrenic parents; biological and adoptive relatives of schizophrenic adults who had been adopted in infancy; adopting parents of adults, now schizophrenic, who had been adopted in infancy.
Methods: Psychiatric interviews and psychological tests.

Findings: Genetic and environmental effects have been separated. There appears to be a genetic effect, magnitude to be determined, in the etiology of schizophrenia, and genetic factors responsible for schizophrenic psychopathology seem to contribute to the presence of other forms of psychiatric disorder not generally regarded as schizophrenia. Relatives of schizophrenic index cases have an increased proportion of nonschizophrenic psychopathology over the control population even when these relatives are not reared in the same household as the index case.
Duration: December 1964-continuing.
Investigator(s): Seymour Kety, M.D., Professor of Psychiatry, Harvard Medical School, Boston, Mass. 02115; David Rosenthal, Ph.D., Chief, and Paul H. Wender, M.D., Research Psychiatrist, Laboratory of Psychology, National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare, Bethesda, Md. 20014.
Publications: The Transmission of Schizophrenia. New York: Pergamon Press, 1968.

23-JG-1 PARENTS AS COTHERAPISTS WITH PSYCHOTIC CHILDREN

Purpose: To identify early signs of childhood psychosis in children under four years of age, and to reverse the disordered processes by demonstrating and teaching techniques to parents; to determine whether such an approach can effectively be used by parents and therapists for developing school readiness in psychotic children.
Subjects: 10 children diagnosed as autistic or psychotic, from intact families willing and able to cooperate in the program.
Methods: Parents observe therapist working with child through a one-way screen. Therapist demonstrates techniques geared to child's individual problem patterns and peculiar usage of receptor modalities. A program is developed which parents carry out on a daily basis at home. Parents demonstrate their interaction while being observed, and rating scales will assess the child-adult interactions. Diagnostic evaluations and tests are administered semiannually to the child. Sessions are recorded on video tape to acquire rater reliability and educational material.
Duration: September 1966-September 1971.
Investigator(s): Eric Schopler, Ph.D., Associate Professor of Psychiatry and Psychology, University of North Carolina School of Medicine, North Carolina Memorial Hospital, Chapel Hill, N. C.
Cooperating group(s): University of North Carolina School of Education; Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Will report in journal articles and at meetings.

23-JG-2 FATHER AND SIBLING CONTROL OF DEVIANT CHILD BEHAVIOR

Purpose: To assess parental and sibling influence in the maintenance of deviant child behavior, and to use these possible control sources as therapeutic agents in changing the child's deviant behavior.
Subjects: Two preschool children referred to a clinic because of emotional problems.
Methods: Parents and siblings were observed interacting with subjects, and problem behavior and parental and sibling contingent behavior were recorded. Efforts were then made to shift these contingencies to demonstrate their effect on the problem behavior of the child.
Findings: Parental and sibling behavior which reinforced problem behavior could be used for therapeutic purposes.
Duration: June 1967-May 1968.

Investigator(s): Robert G. Wahler, Ph.D., Associate Professor of Psychology, University of Tennessee, Knoxville, Tenn. 37916.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Submitted to *Child Development*, 1968.

23-JG-3 FAMILY CONCEPTS, PSYCHOTHERAPY, AND CHILD ADJUSTMENT

Purpose: To investigate the relationship of the adjustment of the child to the family perceptions of the parents, and the changes in family views in relation to psychotherapy, child adjustment, and marital adjustment; to develop an instrument to diagnose and assess family functioning and change.
Subjects: Treatment group of clinic parents, waiting list group, nonclinic group with children high in psychological school adjustment, and nonclinic group with children low in school adjustment. Each group contains 25 to 50 families.
Methods: Treatment families are matched with families in the other three groups on basis of sex, sibling position, rank and intelligence of the child, family size, and occupational and educational level of the father. Families are tested on the Family Concept Q-sort, a marital adjustment test, a family semantic differential, and several other family and therapy measures at points similar to the beginning of treatment, at nine months, at termination, and at a six-month followup. Waiting list cases, who are retested before treatment, need at least a two-month wait after the initial test. Therapist ratings are obtained at the beginning and end of treatment, and teacher ratings and school reports are obtained at the beginning and end of treatment for the therapy group and at equivalent time points for the paired controls.
Findings: The child's adjustment is consistently related to the correspondence between the parents' concepts of the real family and a professional concept of the ideal family, the agreement between family concepts of the mother and father, and the agreement of the parents' concept of the real family and their own ideal.
Duration: June 1967-May 1970.
Investigator(s): Ferdinand van der Veen, Ph.D., Senior Research Associate, Institute for Juvenile Research, 232 E. Ohio St., Chicago, Ill. 60611.
Cooperating group(s): Dane County Mental Health Center, Madison, Wis.; Family Service and Guidance Center, Topeka, Kan.; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

23-JH-1 SYMPTOM STATUS PROJECT

Purpose: To review the major symptom checklists available and to construct a new one utilizing items from several existing checklists, as well as original items to cover the previously uncovered adolescent years; to evaluate the outcome of psychotherapy in terms of changes in symptomatology as reported by mothers of children who are in therapy; to analyze the natural (untreated) course of certain syndromes.
Subjects: Mothers of child guidance patients.
Methods: Comparisons will be made between the symptom scores of treated and untreated children and between pretherapy, posttherapy, and followup scores of treated children. Eventually, the effects of type and severity of symptomatology and types of treatment will also be investigated. Data will be analyzed by analysis of variance.

Duration: May 1966-May 1969.
Investigator(s): Elise E. Lessing, Ph.D., Senior Research Associate, Institute for Juvenile Research, 232 E. Ohio St., Chicago, Ill. 60611.
Publications: To be published in professional journal.

23-JH-2 A SYSTEM OF CORRECTIVE INTERVENTIONS IN A RESEARCH POPULATION

Purpose: An earlier study examined the influence of parental psychosis on child development. (See *Research Relating to Children*, Bull. No. 20-LJ-1.) This project attempts to study the effects of therapeutic intervention on the research sample under controlled conditions, using techniques based on the findings in the first project.
Subjects: Children of psychotic parents.
Methods: Clinical individual and group psychology, behavior therapy, and therapy directed to the amelioration of specific psychological defects and disturbances found in the course of earlier research.
Duration: September 1967-December 1971.
Investigator(s): E. James Anthony, M.D., Professor and Director, Division of Child Psychiatry, Washington University School of Medicine, St. Louis, Mo. 63110.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Plan to publish in journals of psychiatry, psychology, and social work.

23-JH-3 AN INSTRUMENT FOR PREDICTING BEHAVIOR OF CHILDREN GOING TO A SUMMER CAMP

Purpose: To construct a predictive profile that can be used in planning a more therapeutic coeducational summer camping program for emotionally disturbed children and physically handicapped children.
Subjects: Severely physically handicapped and emotionally disturbed children who attended the Boston Children's Service Association's summer camp.
Methods: Prior to a brief stay at camp, children were tested with three instruments, each of which pertains to four main areas: feelings about the physical environment, peers, authority, and major gratifications and anxieties expected under stress. The first instrument is a questionnaire filled out by the child's group leader and based on experiences in the group or with the child alone; the second is a series of 14 pictures of the actual camp with specific questions about each picture; the third is a sentence completion test of 24 items about camp. Behavioral observations were also made of each child at camp under the same four main areas. Following his stay at camp, each child was again given the picture and sentence completion tests to check the impact of actual experience on precamp fantasies.
Duration: 1967.
Investigator(s): Constance Rathbun, M.S.W., Director of Research, Robert J. Paradise, M.S.S.A., Director of Camp Services, and Edleff Schwaab, Ph.D., Clinical Psychological Consultant, Boston Children's Service Association, 3 Walnut St., Boston, Mass. 02108.

23-JH-4 MODELING AND TANGIBLE REWARDS IN CHILD GROUP THERAPY

Purpose: To conduct a clinical-experimental study of certain types of group play therapy in which a maximum number of relevant variables are controlled; specifically, to develop prosocial behaviors in socially

maladjusted boys by applying the techniques of modeling and positive reinforcement in the treatment; to evaluate the impact of the therapist.
Subjects: 96 second, third, and fourth grade boys from the Pasadena School District referred by their teachers as being shy, anxious, and withdrawn.
Methods: Four fourth grade boys from the LaCanada Unified School District and identified by their teachers and principals as the best liked by their peers and the most outgoing, bright, and socially attractive, were used as models in developing 20 five-minute videotapes in which they played and acted out various behavioral themes. Tapes began with a low level of assertiveness and social interaction and progressed to higher levels. Forty-eight children will be recruited in the fall of 1968 and 1969 and assigned at random to six treatment combinations: (1) modeling tapes alone, (2) modeling tapes plus therapist, (3) modeling tapes, plus therapist, plus positive reinforcement, (4) therapist alone, (5) therapist plus positive reinforcement, and (6) no modeling tapes, no therapist, and no positive reinforcement. Each group will meet for 24 sessions, and mothers will meet in guidance groups. Several dependent variables will be measured by gathering data from teachers, mothers, fathers, classmates, and subjects, and from observation. Children will be followed for two years after therapy.
Duration: January 1968-December 1970.
Investigator(s): Paul W. Clement, Ph.D., Director of Clinical Training, Fuller Graduate School of Psychology, Pasadena, Calif. 91101.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Videotapes to be shown at American Psychological Association Meeting, September 1968. Publications planned in 1970; interim information available from Dr. Clement.

23-JH-5 UTILIZATION OF COMMUNITY HELPERS FOR MEETING THE PSYCHOLOGICAL AND EDUCATIONAL NEEDS OF EMOTIONALLY HANDICAPPED CHILDREN

Purpose: To demonstrate the efficacy of using community helpers in meeting the psychological and educational needs of emotionally handicapped children.
Subjects: Emotionally handicapped children selected upon recommendation of the school psychologist; control group.
Methods: Experimental and control groups were tested to determine personality adjustment, perception of interpersonal relationships, and weak areas in academic knowledge and skills; a supportive program was then drafted. Community mothers were selected as helpers and assigned to work with the children on an individual basis. Experimental and control groups were retested, and at the beginning of the following school year a representative sampling of the two groups was given a final evaluation.
Duration: July 1966-July 1968.
Investigator(s): Donald C. Smith, Ph.D., Department of Psychology, Ohio State University, Columbus, Ohio 43210.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

23-JH-6 PHARMACOTHERAPY OF HYPERACTIVE CHILDREN

Purpose: To compare the effectiveness of various commonly used drugs on hyperactivity in children; to study the effects of medications on many indices of learning.

Subjects: 400 hyperactive boys, ages 6 to 10, from inner city schools.
Methods: In a double blind technique, five groups of 80 boys each are being treated with dextro-amphetamine, diphenylhydantoin, chlorpromazine, hydroxyzine, and placebo. Improvement will be measured clinically through interviews and classroom behavior ratings, and by a variety of psychological evaluations of learning acquisition, distractibility, and hyperactivity.
Duration: January 1968-December 1970.
Investigator(s): Lawrence M. Greenberg, M.D., Director, Psychopharmacology Service Center, and Reginald S. Lourie, M.D., Medical Director, Department of Psychiatry, Children's Hospital, Washington, D. C. 20008.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

23-JI-1 ADOLESCENT REHABILITATION PROGRAM

Purpose: To treat adolescent patients at the Hawthornden State Hospital by placing them in a highly structured therapy program.
Subjects: Emotionally disturbed adolescents.
Methods: Program includes an accredited school program and a dormitory situation structured through implementation of the learning theory based on the privilege and demerit system. When subjects manifest desirable behavior, they are given chips which may be used to obtain extra candies or foods. Pink warning slips are given for undesirable behavior. Students are provided with an opportunity to control and direct their own behavior. Effectiveness of program will be evaluated through subjective and objective means, such as periodic administration of personality and scholastic achievement tests which will measure changes brought about by modification of the environment through psychotherapy and drug therapy.
Duration: Not reported-1970.
Investigator(s): Donald J. Kellon, M.D., Superintendent, Ellen Diss, M.S.W., Psychiatric Social Worker, E. Barker, M.A., Psychologist, and staff, Hawthornden State Hospital, Box 305, Northfield, Ohio 44067.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

23-JI-2 PEDIATRIC PSYCHIATRIC INPATIENTS IN A GENERAL PEDIATRIC HOSPITAL

Purpose: To integrate psychiatric and nonpsychiatric patients, with pediatricians, pediatric residents, and psychiatrists working together; to train nonpsychiatric physicians and staff to be sensitive to emotional disorders.
Subjects: All psychiatric inpatients, especially acute cases.
Methods: Patients are integrated on the wards and utilize the same facilities, such as playroom, volunteer services, dining room, etc. There is continued training of physicians, nurses, volunteers, practical nurses, aides, and administrators. All children are subject to pediatric, psychiatric, neurological, endocrine, and education evaluation.
Duration: September 1966-indefinite.
Investigator(s): Alvin Friedland, M.D., Director, Pediatric Psychiatry, O. Haller, M.D., M. Prystowski, M.D., and J. Schwartz, M.D., Pediatricians, Babies Hospital, Newark, N. J. 07107.
Publications: Publication planned.

23-JI-3 EXTENSION OF SERVICES TO CHILDREN AND YOUTH

Purpose: To improve the effectiveness of an intensive inpatient program at Central State Hospital from initial referral through treatment, follow-up planning, and placement; to demonstrate the efficacy of early diagnosis and intensive treatment in the care of the child and adolescent.
Subjects: Mentally ill children, ages 4 to 18.
Methods: Coordination of the Adolescent and Children Programs in both living facilities and activities; increase in services through a day care program for children who live close enough to the hospital to commute daily; enhancement of the program with participation of students in all disciplines.
Duration: 1965-August 1968.
Investigator(s): Ray H. Hayes, M.D., Superintendent, David Irigoyen, M.D., Chief, Medical Service, and Joan Williams, Psychologist, Central State Hospital, State Department of Mental Health, Louisville, Ky. 40223.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

23-JI-4 ADOLESCENT UNIT DEVELOPMENT PROGRAM

Purpose: To determine the posthospital educational, social, and vocational adjustment of former patients on the Adolescent Treatment Unit of the North Dakota State Hospital.
Subjects: 57 patients under age 18 released from the State Hospital during the calendar year 1965.
Methods: Questionnaires are sent to schools, county welfare offices, and juvenile commissioners concerning their contact with or knowledge of the former patients. County public health nurses visit the families and fill out a questionnaire. Additional information is sought from community mental health centers, correctional institutions, etc.
Duration: January 1968-January 1969.
Investigator(s): Walter F. Steinman, Ph.D., Chief of Psychological Services, and W. Krentz, M.S.W., Social Worker, Adolescent Treatment Unit, North Dakota State Hospital, Jamestown, N. D. 58401.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

23-JI-5 EDUCATION PROGRAM FOR 16- TO 20-YEAR-OLDS

Purpose: To provide a formal education program for adolescents in a state mental hospital.
Subjects: 50 patients, ages 16 to 20, at Creedmoor State Hospital.
Methods: Subjects attend a school on the hospital grounds staffed by five teachers, a psychologist, psychiatrist, social worker, and stenographer. Program is geared to the individual needs of the patients and staffed by personnel alert to the special teaching problems of adolescent mental patients. It is expected that the program will allow some patients to get high school equivalency diplomas, enabling them to get better employment or to continue their education following release from the hospital; for others it will give basic reading, writing, and mathematical skills providing for prevocational education.
Duration: September 1967-September 1970.
Investigator(s): Harry A. LaBurt, M.D., and Morton B. Wallach, M.D., Psychiatrists, Creedmoor State Hospital, Queens Village, N. Y. 11427.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

23-JI-6 AN ADOLESCENT CONSULTATION SERVICE IN A STATE MENTAL HOSPITAL

Purpose: To evaluate the Adolescent Service in its clinical operations.
Subjects: 50 adolescents, ages 16 to 18, admitted consecutively to Boston State Hospital beginning October 1967.
Methods: Evaluation, by a variety of techniques, of the Adolescent Service consultation and central facilities programs, and intensive clinical analysis of individual cases.
Findings: Initial research has established the feasibility of a consultation and central facilities approach for the treatment of adolescent patients in a state hospital.
Duration: January 1967-December 1970.
Investigator(s): Anton O. Kris, M.D., Director, and Lawrence F. Schiff, Ph.D., Associate Director, Adolescent Service, Boston State Hospital, Boston, Mass. 02124.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Article submitted to *Archives of General Psychiatry*.

23-JI-7 A FOLLOWUP STUDY OF CHILDREN IN RESIDENTIAL TREATMENT CARE

Purpose: To evaluate the usefulness of residential treatment of emotionally disturbed children.
Subjects: 42 children discharged from residential treatment centers between January 1, 1958 and December 31, 1967.
Methods: Review of case records; conferences with agencies providing followup care; personal interviews and correspondence with those no longer in contact with agencies.
Findings: Median age of entrance into residential treatment was 14 years for both boys and girls. Antisocial behavior was the principal reason for admission. Median length of stay in residential treatment was three years for boys and two-and-one-half years for girls.
Duration: August 1968-February 1969.
Investigator(s): Viola W. Weiss, M.S.S.A., Director, Community Services, and Sanford Weiss, M.S.S.A., Executive Director, Jewish Children's Home Service, 5342 St. Charles Ave., New Orleans, La. 70115.
Publications: Mimeographed reports will be available after March 1969.

Socially Deviant

Note: Some of the following delinquency studies were taken from the section "Current Projects", in *Crime and Delinquency Abstracts*, Vol. 4, No. 3, and Vol. 5, Nos. 1 and 7. This publication is prepared by the National Clearinghouse for Mental Health Information of the National Institute of Mental Health (5454 Wisconsin Ave., Chevy Chase, Md. 20203) from material provided by the National Council on Crime and Delinquency (44 E. 23rd St., New York, N. Y. 10010). The studies are noted: (Reported by NCCD.)

23-KA-1 STUDY OF RECIDIVISM OF UNMARRIED PREGNANT GIRLS

Subjects: Negro girls under age 18 living in San Francisco who had a first child delivered out of wedlock in the years 1959-1962.
Methods: Birth records will be used to identify subjects; their present addresses will be obtained through vital statistics, hospital and agency records, etc. Interviews are conducted with each girl in which information is obtained about her reproductive history subsequent to the first pregnancy, socioeconomic factors, knowledge and utilization of family planning and medical care, vocational training, education, and employment.
Duration: January-December 1968.
Investigator(s): Helen M. Wallace, M.D., M.P.H., Professor of Maternal and Child Health, University of California School of Public Health, Berkeley, Calif. 94720.
Cooperating group(s): Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, Welfare.

23-KC-1 DELINQUENT SUBCULTURES OF PHILADELPHIA: A SOCIOLOGICAL INVESTIGATION OF 312 DEVIANT GANGS AND GROUPS

Purpose: To examine the patterns of delinquency in organized juvenile gangs as compared to juvenile groups; to analyze a number of theoretical propositions pertaining to the delinquent subculture.
Subjects: 312 gang and group events investigated by the Philadelphia Gang Control Unit from July 1, 1965 to June 30, 1966; 1,858 prior police contacts incurred by 374 gang and group offenders.
Methods: The 312 gang and group events were compared on the basis of police reports for content of offense, aggregative characteristics of offenders, characteristics of victims, and response elicited from community. The 374 gang and group offenders were analyzed year by year beginning with age seven to determine the precise age at which offenders begin to actively participate in gangs and the age at which they desist from gang activity. The age-specific analysis includes an examination of the delinquent careers of a 16-year-old group and gang age cohort.
Findings: Gangs engage primarily in violent and at the same time more serious delinquent behavior than groups, and strong offender-victim relationships emerge for gangs. Group victims are random and diffuse. Delinquent patterns characterizing gang and group offenders are identical to age 14, where they begin to diverge. The age of onset of delinquency

is the same for "all offenses" and various offense categories for both gang and group offenders.
Duration: September 1966-April 1968.
Investigator(s): Bernard Cohen, Ph.D., 55-25 98th Pl., Rego Park, N. Y. 11368.
Cooperating group(s): University of Pennsylvania, Philadelphia, Pa. 19104.

23-KC-2 CHILD AND YOUTH SERVICES PLANNING PROJECT

Purpose: To obtain information needed for long-range planning of services to youth in Colorado, especially those who are delinquent, predelinquent, and in need of services.
Subjects: All relevant agencies in counties with urban population.
Methods: Structured interviews were held with free response items organized according to a logical model of agency structure and function.
Findings: A variety of needs for staff and programs exist now and will rise steadily through 1980.
Duration: June 1967-June 1968.
Investigator(s): Desmond S. Cartwright, Ph.D., Professor of Psychology, University of Colorado, Boulder, Colo. 80302.
Cooperating group(s): Youth Services Division, Colorado Department of Institutions; National Council on Crime and Delinquency; Office of Juvenile Delinquency and Youth Development, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.
Publications: Final report, 1968, available from Division of Youth Services, Department of Institutions, Box 206, Fort Logan, Colo. 80115.

23-KD-1 AN INVESTIGATION OF A SCALE TO PREDICT POTENTIAL DELINQUENTS, USING THE SCHOOL INTEREST INVENTORY

Purpose: To attempt to identify items of the School Interest Inventory which will permit classification and counseling of potential delinquents before the occurrence of actual delinquent encounters with the law.
Subjects: Groups of 200 matched delinquents and nondelinquents, boys and girls, ages 12 to 17, from each of the states Massachusetts, Rhode Island, and Connecticut.
Methods: The School Interest Inventory is administered to all subjects. Those items of the SII which differentiate delinquents from nondelinquents are identified by item analysis and phi coefficients. Scale will be validated by comparison with data derived from another group.
Findings: Studies in Kansas indicate that delinquent boys can be identified. Their responses resemble those of girl dropouts and girls in general more than they resemble responses of boy dropouts or boys in general.
Duration: March 1968-March 1969.
Investigator(s): William C. Cottle, Ed.D., Professor of Education, and Director, Counselor Education and Counseling Psychology Program, Boston College, Chestnut Hill, Mass. 02167.
Cooperating group(s): Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.

23-KD-2 PREDICTING THE BEHAVIOR OF ADJUDGED DELINQUENTS

Purpose: To identify, at the time of their initial adjudication by a juvenile court, those youngsters who are most likely to reappear as recidivists.

Subjects: 2,000 juveniles to age 16 from Baltimore City, and 1,000 juveniles to age 18 from Baltimore County, all adjudicated delinquent for the first time between June 1967 and May 1969.
Methods: Demographic, social, familial, personal, and psychological data obtained by means of a questionnaire and group testing will be analyzed by a linear regression equation to determine whether these data can discriminate between recidivists and nonrecidivists. Original sample will be divided into experimental and cross-validation groups, and findings derived from the experimental group will be applied to the cross-validation group. Subjects will be followed for two to four years to determine their proneness to recidivism.
Duration: June 1967-May 1971.
Investigator(s): George Lassen, Ph.D., Court Psychologist, Circuit Court for Baltimore County, Towson, Md. 21204.
Cooperating group(s): Friends of Psychiatric Research.
Publications: Initial findings to be submitted for publication at the end of 1968.

23-KD-3 PROJECT "ESCAPE TEST"

Purpose: To locate escape-prone inmates in a youth prison.
Subjects: 413 inmates of a youth prison received between May 1956 and May 1959.
Methods: A simple picture test is administered to the boys. Information about escapes is being collected, together with data on social background, previous and present criminality, course of stay in youth prison, and course of supervision period after release on parole. Recidivism within five years of release is checked through examination of the central police register.
Duration: May 1956-continuing.
Investigator(s): Jan Kaarsen, Research Associate, Institute of Criminal Science, University of Copenhagen, Copenhagen, Denmark. (Reported by NCCD.)
Cooperating group(s): Danish State Research Foundation.

23-KD-4 A COMPARISON OF YOUTHS WITH BEHAVIOR AND ADJUSTMENT DIFFICULTIES

Purpose: To discover whether clusters of symptoms and background factors are present among children with behavior and adjustment difficulties, clearly discriminating between diagnostic groupings; to compare youths who received treatment with those who did not.
Subjects: Youths, ages 12 to 18, having behavior and adjustment difficulties, including asociality and criminality. Diagnostically, group includes psychoses, neuroses, organic diseases of the brain, and various kinds of deviant behavior.
Methods: Psychiatric, psychological, and social study, with followup.
Duration: November 1965-indefinite.
Investigator(s): Per Nyhus, M.D., Chief Physician, Government Centre for Child and Youth Psychiatry, Boks 26, Vinderen, Norway. (Reported by NCCD.)

23-KD-5 SELF-REPORTING AS A PROGNOSTIC INDICATOR IN JUVENILE DELINQUENCY

Purpose: To determine clusters of behaviors affecting past involvement in crime and delinquency which will be predictive of case outcome.
Subjects: 200 consecutive male adolescents held for adjudication in the Juvenile Court of the District of Columbia.

Methods: Court workers administer a self-reporting instrument to the boys, and responses are factor analyzed. Actual disposition of the case and the projected evaluation of it made by the court workers will be used as criteria.
Duration: Continuing.
Investigator(s): Simon Dinitz, Ph.D., and Walter Reckless, Ph.D., Professors of Sociology, Ohio State University, Columbus, Ohio 43210. (Reported by NCCD.)

23-KD-6 PREDICTION OF RECIDIVISM

Purpose: To determine whether it is possible at the time of first court appearance to discriminate between those children who will commit serious crimes in adulthood and those who are likely to be minor offenders or nonoffenders.
Subjects: The 500 juvenile delinquents studied in Unraveling Juvenile Delinquency and followed up in Delinquents and Nondelinquents in Perspective.
Methods: Cross-classification of the basic data in the first study and of certain behavioral data of the followup study with a view to providing materials for constructing a discriminative predictive instrument. (The followup study indicated that 32.6 percent remained persistent offenders to age 31, 19.2 percent were minor offenders, and 48.2 percent were nonoffenders.)
Duration: January 1967-June 1968.
Investigator(s): Sheldon Glueck, Ph.D., LL.D., Roscoe Pound Professor of Law, Emeritus, and Director, and Eleanor T. Glueck, Ed.D., Research Associate and Codirector, Special Research Project, Harvard Law School, Cambridge, Mass. 02138.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Findings may be included in Toward a Clinical Typology of Delinquents, in preparation, 1968.

23-KD-7 CLINICAL AND COMMUNITY STUDIES OF JUVENILE DELINQUENCY

Purpose: To devise a classification of juvenile court first offenders in order that two classes could be defined in a fashion allowing for computer classification; one class had a "good" prognosis or prediction, and the other, a "poor" prognosis, considering probability of return to court.
Subjects: Random sample of 134 juvenile court first offenders in a community of 50,000 to 100,000 population, rated on specially devised measuring schedules tested for reliability. Sample not given intervention at time of first offense. Followup done one and one-half years later to determine who had returned to court.
Methods: Total sample was stratified by outcome (recidivist vs. nonrecidivist) and by area of residence, then randomly divided into two subsamples (a "learn" and "test" series). Individual items on each schedule that statistically (p .05) showed differences between recidivist and nonrecidivist on the "learn" studies and could be cross-validated on the "test" series were used for a computer classification procedure. Items tested in this manner came from a Rorschach rating schedule, social data schedule, physical health data schedule, group interaction data schedule, social work (parental coping) data schedule, and psychiatric data schedule. Only the psychiatric (diagnostic interview) data schedule was found to have better than chance discriminatory power using this cross-validation

technique. A pattern recognition technique was used allowing a syndrome of characteristics (nearly all drawn from the psychiatric schedule) to be used to machine-classify all first offenders (N=95) and all recidivists (N=39) on total sample.
Findings: Results showed a 63 percent accuracy in classification of recidivists and an 81 percent accuracy in classification of nonrecidivists. With this computer classification system one needs only 51 first offenders to expect 30 future recidivists. The cost of evaluating a delinquency prevention program using this outcome variable could be reduced by 50 percent, since, without the system it would be necessary to select 100 first offenders at random in order to expect 30 future recidivists in 1.5 years. Subjective global judgments of child psychiatrists have greater discriminatory value than do objective factors in identifying the persisting delinquent. Lower social class status exerts its major influence on the future persisting delinquent before he first comes to court.
Duration: 1959-1968.
Investigator(s): B. R. Hutcheson, M.D., Director of Mental Hygiene, Massachusetts Department of Mental Health, 15 Ashburton Place, Boston 02108, and Assistant Clinical Professor of Psychiatry, Harvard Medical School, Boston, Mass. 02115.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: The British Journal of Criminology 6:4:354-363, October 1966; American Journal of Public Health 53:3:418-424, March 1963; American Journal of Orthopsychiatry 33:3:397-398, April 1963.

23-KJ-1 SOURCE REFERRAL TO THE JUVENILE COURT: ITS RELATIONSHIP TO PERCEPTIONS OF PARENTHOOD AND CRISIS

Purpose: To investigate the relationship between source of referral to the juvenile court and perceptions of parenthood and crisis impact; specifically, to determine if source of referral is related to family attitudes that would help in understanding and working with juvenile delinquents.
Subjects: 66 mothers of charged delinquents, including 40 police referrals, 12 school referrals, and 14 parent referrals.
Methods: Subjects were interviewed immediately prior to their child's court hearing; questionnaire included an inventory of social characteristics, Duvall's instrument for measuring conceptions of parenthood, and Farber's Scale of Initial Emotional Impact for testing degree of crisis.
Findings: Source of referral was shown to be important as a differentiation factor in understanding the mothers in terms of their perceptions of parenthood and the impact of court experience. Differential degrees of parental participation and involvement in the court referral process were considered as significant in attempting to explain the influence of source of referral. Parent referrals represented the greatest degree of awareness and participation by the parent in the referral process.
Duration: Not reported.
Investigator(s): Harris Chaiklin, Ph.D., University of Maryland School of Social Work, Baltimore, Md. 21201.

23-KK-1 POLICE-SCHOOL CADET PROGRAM

Purpose: To classify predelinquents using a typology which has implications for treatment; to help students acquire a more positive attitude toward the police; to reduce juvenile delinquency by early identification and utilization of community resources.

Subjects: All fifth grade students from two middle class and two lower class Flint, Mich. elementary schools; group of 100 predelinquent upper elementary children.
Methods: Group of 100 students participate in police-oriented club activities designed to help them develop a more realistic concept of the policeman. An attitude-toward-police scale is administered to all fifth grade children and readministered prior to summer vacation to ascertain any change in attitude.
Duration: 1965-continuing.
Investigator(s): James W. Rutherford, Chief, Frank Rutherford, Detective Sergeant, Terrance Maxwell, Consultant, and Carl Pendell, Staff Assistant, Crime and Delinquency Prevention and Treatment, Police Department, 210 E. Fifth St., Flint, Mich. 48502.

23-KK-2 THE ADOLESCENT SOCIAL SYSTEM AS A CONTROL AGENT IN MIDDLE CLASS COMMUNITIES

Purpose: To examine the nature and dimensions of juvenile delinquency in affluent middle class communities, and to devise programs to effectively control and prevent such delinquency through the direct involvement of youth in decisionmaking activities which focus upon youth.
Subjects: Youth from two middle class San Francisco Bay Area communities.
Methods: A youth commission was established in each of the two communities in which youth played an active role in the design, implementation, and operation of programs as members of the organizations with rights and voting privileges equal to adults. Over 40 separate programs were initiated, ranging from long-range continuing policymaking groups to short-range one-day programs. All were related to the central theme of increasing the community's capacity to absorb its own delinquency through a redefinition of deviance on the part of adults, the development of awareness in the community of the problems of youth, and involvement of youth with adults in decisionmaking. One unique program of police-youth discussion groups was designed to produce mutual understanding between police and probation officers and youth referred from the probation department who had been adjudicated delinquent by the local juvenile court. The program focused on the problem-oriented segment of the youth population rather than the generality of young persons. Other activities centered around Big Brother programs, vocational testing, career development, theatre, newspapers, athletic and recreational programs, personality development, sex education, and a drug seminar, among others.
Findings: Data reflect a law enforcement level absorption of between 70 and 80 percent, with both communities experiencing some increase in absorption at the police level. The most effective programs involved shared responsibility of adults and youth, while the least effective had either adult or youth control. It appears that any segment of the youthful community can be addressed by programs relevant to its membership once it has been accurately identified and its total configuration established. Thus far, both youth councils have been continued with local funds, direction, and effort.
Duration: June 1966-January 1968.
Investigator(s): Joseph D. Lohman, M.A. (deceased), Dean, School of Criminology, University of California, Berkeley, Calif. 94720.
Cooperating group(s): Office of Juvenile Delinquency and Youth Development, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.
Publications: Middle-Class Delinquency: An Experiment in Community Control. Berkeley: School of Criminology, University of California, April 1968.

23-KP-1 SIMBAD (SIMULATION AS A BASIS FOR SOCIAL AGENTS DECISIONS)

Purpose: To introduce new knowledge and technology into the practice of probation.
Subjects: Data on 2,290 juveniles referred to eight Southern California probation departments in October and November 1963; 10 percent of the current caseloads of the cooperating departments.
Methods: Participating departments will have remote, real time access to a large-scale computer facility which will provide probability estimates of success for disposition and treatment decisions at any point in the process, with the objective of effecting a true process of change by the automatic updating, incrementing, and evaluating features of the system. Two basic mathematical models, based on data from past research on the juveniles, will be developed. The first will produce the probabilities of success, based on the likelihood of recidivism, associated with different paths through the probation process; the second will produce probabilities to indicate which alternative is most likely to be selected. Initial levels of congruence between these two models will be established to serve as the baseline measure of the impact of the program. Auxiliary models will be developed to meet special needs of probation departments.
Duration: April 1967-March 1971.
Investigator(s): Alexander W. McEachern, M.A., Director, and E. M. Taylor, M.A., Codirector, Youth Studies Center, University of Southern California, Los Angeles, Calif. 90007.
Cooperating group(s): System Development Corporation; Ford Foundation; Office of Law Enforcement Assistance, U. S. Department of Justice.
Publications: American Behavioral Scientist 11:3, January-February 1968.

23-KP-2 LEGAL SERVICES TO YOUTH

Purpose: To describe and evaluate legal services to youth in Chicago.
Subjects: Negro boys under age 17, and girls under 18.
Methods: Anthropological, experimental, and ethnographic.
Duration: September 1966-September 1968.
Investigator(s): Anthony Platt, D.Crim., Research Fellow, University of Chicago Law School, Chicago, Ill. 60637.
Cooperating group(s): Center for Studies in Criminal Justice, University of Chicago.
Publications: Final report to Center for Studies in Criminal Justice; monograph or various articles planned.

23-KQ-1 POSITIVE ACTION FOR YOUTH

Purpose: To provide ways and establish resources for juvenile probationers to stabilize behavioral patterns while remaining in their own environmental setting.
Subjects: Male juvenile probationers attending Flint, Mich. junior and senior high schools.
Methods: Program attempts to serve family problems through group counseling, work experience, family counseling, supportive action, and individual counseling by concerned school and social agency personnel. Academic and attitude progress is evaluated through such measurement devices as a police attitude questionnaire, youth evaluation form, and parental evaluation form.
Findings: Fifteen boys enrolled in the program in the 1966-67 school year had one police contact as compared to 28 the previous year; unexcused absences decreased from 286 to 120; times tardy remained the same; and grade average progressed from "D" to "C".

Duration: September 1966-continuing.
Investigator(s): Terrance Maxwell, Consultant, Board of Education, Flint, Mich. (Reported by NCCD.)
Cooperating group(s): Mott Program, Board of Education, Flint, Mich.

23-KR-1 A COMPARATIVE STUDY OF THE STRUCTURE OF TWO DANISH HOMES FOR YOUNG OFFENDERS

Purpose: To compare the structure of a new progressive school for girls with that of an old authoritarian school for boys.
Subjects: Boys and girls, ages 15 to 17; institution personnel.
Methods: A questionnaire was administered to pupils and personnel, and interviews were repeated at intervals to include the time dimension. Data were collected on (1) relationship between different groups of pupils, pupils and personnel, and different groups of personnel; (2) possible value conflicts between various groups; (3) differences in value conflicts in the two types of schools; (4) value differences between a boys' and a girls' school; and (5) value differences in a new and old institution.
Duration: 1965-December 1967.
Investigator(s): Britt-Mari Persson Blegvad, Research Associate, and Asger Hansen, Strandvej 95, O, Copenhagen, Denmark. (Reported by NCCD.)

23-KR-2 RESEARCH ON CONTROLLED ALLOCATION OF BOYS TO BORSTAL INSTITUTIONS WITH DIFFERING TREATMENT EMPHASIS

Purpose: To determine the effect of interaction between three borstal institutions and a variety of psychosociological data on reconviction rate of delinquent boys.
Subjects: Boys committed to a borstal institution by the court.
Methods: The three borstals are small and open; the first emphasizes casework, the second, hard and purposeful work, and the third is oriented to small groups and community responsibility. Boys are first selected for a "pool" having a composite image of all three borstals; there they are intensively interviewed on the basis of a prepared schedule and given a battery of special tests. At set intervals they are randomly allocated to vacancies in the three borstals. Following release, a risk period of at least two years will be allowed before main analysis of interaction model is made through reconviction rate.
Duration: February 1964-1968.
Investigator(s): A. Straker, Chief Psychologist, Prison Department, Home Office, Romney House, Marsham St., London, S. W. 1, England. (Reported by NCCD.)

23-KS-1 THE ADULT ADJUSTMENT OF CHILDREN PLACED IN PRIVATE BOARDING SCHOOLS BY THE JUVENILE COURT: A LONGITUDINAL STUDY

Subjects: Children placed in private boarding schools by the Summit County Juvenile Court in 1953; control group of children referred to the court but not placed in boarding schools. Groups are matched with respect to I.Q., number of referrals to court, age, home address, time of referral, socioeconomic level of family, and level of education.

Methods: Rorschach and Draw-a-Person Tests are administered and results compared for changes with results of same tests given prior to boarding school placement; subjects are also given two questionnaires and are interviewed. Police and court records are being checked for information concerning adjustment since boarding school. The boarding school group is divided into successful and unsuccessful boarding school placement, and these two groups will be compared on adjustment subsequent to boarding school. Subjects and controls will be compared for later adjustment before and after age eighteen.
Duration: Not reported-1969.
Investigator(s): Norman G. Bills, Ph.D., Department of Education, University of Akron, Akron, Ohio 44304.
Cooperating group(s): Summit County Juvenile Court, Akron, Ohio 44310.

23-KS-2 JUVENILE OFFENDERS REHABILITATION PROJECT

Purpose: To investigate the influence of special modeling and identification opportunities on the behavior of adolescent delinquent boys; to evaluate hypothesis that systematic exposure to meaningful identification models can have a discernible and salutary influence on the social, vocational, and educational development of the juvenile offender.
Subjects: Small groups of institutionalized male juvenile offenders, ages 15 to 18; control groups.
Methods: Boys are systematically exposed to group leaders (models) who enact, via role-playing procedures, different situations (such as a job interview) which are determined to be of importance to the rehabilitation of the juvenile offender. The boys then imitate, practice, and discuss the various roles. Guided discussion is included, and focus is on offenders' vocational plans, motivations, and interests, social skills, attitudes toward work, and behavior having to do with school. Effects of modeling will be assessed both at the institution and by followup.
Findings: Preliminary studies have indicated significant positive changes across several dimensions of self-concept, attitudes, and overt behavior of experimental as compared to control group boys.
Duration: October 1966-October 1970.
Investigator(s): Irwin G. Sarason, Ph.D., Professor of Psychology, and Victor J. Ganzer, Ph.D., Assistant Research Professor of Psychology, University of Washington, Seattle, Wash. 98105.
Cooperating group(s): Cascadia Juvenile Reception-Diagnostic Center, State Department of Institutions; Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.
Publications: American Psychologist 23:254-265, 1968.

23-KS-3 POST GANG CAREER FOLLOWUP STUDY

Purpose: To identify, by means of various measures of participation, the effect of membership in a delinquent gang upon the subsequent careers of former members; to test hypothesis that those who participated most intensely in the gang's activities would be most likely to have greater amounts of unemployment, arrests, and involvement in crime.
Subjects: Former members of a delinquent gang.
Methods: As many of the former members as possible are contacted and interviewed. Detailed data on their participation in the group are already recorded from observations made previously. Two of the more important independent variables are amount of participation and clique membership. There are also variables which assess experiences during the

intervening years, such as continuing contact with former members, residential change, attempts at schooling, source of help in getting jobs, and arrests. As dependent variables, occupational, personal, and legal adjustment will be assessed.
Findings: There are indications that those interviewed who have made the best social adjustment tend to have been high participators in the group. The distinction between good and poor social adjustment seems to depend more on clique participation.
Duration: March 1967-December 1968.
Investigator(s): Leon R. Jansyn, M.A. (Ph.D. Candidate, Southern Illinois University), Assistant Research Specialist, Department of Sociology, Rutgers, The State University, New Brunswick, N. J. 08903.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: *American Sociological Review* 31:5, October 1966.

23-KS-4 MANAGEMENT OF JUVENILE OFFENDERS AND EMOTIONALLY DISTURBED CHILDREN THROUGH AFFECT

Purpose: To test whether undirected production of any or all emotional responses could result in generalized improvement of behaviorally disordered individuals who are often characterized by constricted, inappropriate, or avoidant responses.
Subjects: Male and female juveniles and older hospitalized female psychotics; control groups.
Methods: Conditioning technique utilizing aversive stimuli (constant but increasing electric shock which is relieved on production of any new answer to a simple question); physical manipulation of musculature; and mass routines of eurythmics and directed breathing and emotive exercises.
Duration: Not reported-1970.
Investigator(s): Douglas A. Quirk, M.A., Senior Psychologist, Clark Institute of Psychiatry, 250 College St., Toronto, Ontario, Canada.

23-KS-5 EFFECTS OF DESENSITIZATION THROUGH RECIPROCAL INHIBITION OF SELECTED ANXIETY SYSTEMS IN BEHAVIORALLY DISORDERED CHILDREN

Purpose: To test the feasibility of large group or mass treatment procedure on school performance and delinquent behavior.
Subjects: Boys and girls, ages 12 to 18; control groups.
Methods: Motion picture films depicting hierarchies of visual stimuli commonly associated with anxiety arousal are presented to the subjects in a group, varying accompanying auditory and visual aversive and conditioned relief stimuli. Using a desensitizing procedure (conventional, inverted, and mixed), without artificially induced responses in the subjects, attempts will be made to suppress anxiety reactions to the presented stimuli. Effectiveness of the procedure will be assessed in terms of school performance, school behavior, and observed delinquent behavior. Control groups receive no treatment, psychotherapy, or inverted hierarchy groups.
Duration: Not reported-1970.
Investigator(s): Douglas A. Quirk, M.A., Senior Psychologist, Clark Institute of Psychiatry, 250 College St., Toronto, Ontario, Canada.

23-KS-6 SOME MEASURES OF EGO STRENGTH AND SELF-CONCEPT BEFORE AND AFTER PLASTIC RECONSTRUCTIVE SURGERY

Purpose: To evaluate effects of plastic surgery upon ego strength and self-concept of juvenile delinquents.
Subjects: Male and female juvenile delinquents, ages 12 to 18, in need of plastic reconstruction; neither psychotic nor functioning with an I.Q. of less than 80.
Methods: The H-T-P, MMPI, Bender-Gestalt, and Black's Adjective Check-list are administered one week prior to surgery and six weeks following completion of surgical procedure.
Findings: Preliminary findings indicate statistically significant changes in ego strength and self-concept formation following plastic reconstructive surgery.
Duration: September 1964-September 1968.
Investigator(s): Robert S. Jones, Psychologist, Leo Munick, Jack Longacre, and Robert Wood, Hamilton County Juvenile Court, 2020 Auburn Ave., Cincinnati, Ohio. (Reported by NCCD.)
Cooperating group(s): Christ Hospital, Cincinnati.

23-KS-7 DEVELOPMENT OF EDUCATIONAL AND TREATMENT ATTITUDES IN STAFF IN A PROTOTYPE INSTITUTION FOR MALADJUSTED YOUTH

Purpose: To measure the influence of counseling by the professional team of the Institute for Criminology on the changes in staff attitudes and on the working and professional dynamics of the staff of an institution for maladjusted youth.
Subjects: Inmates of the institution, boys ages 15 to 18, and staff.
Methods: Staff members are selected through various tests and interviews. They attend seminars, have practice in other institutions, and receive group and individual counseling. At regular intervals, attitudes of staff and inmates are measured. All events are well documented.
Duration: August 1967-February 1972.
Investigator(s): Katja Vodopivec, LL.D., Scientific Counselor and Director, Vinko Skalar, Psychologist and Collaborator, and Bronislav Skaberne, LL.D., Higher Scientific Collaborator, Institute for Criminology, Faculty of Law; Milica Bergant, Ph.D., Pedagogist and Professor, Faculty of Philosophy; and Milos Kobal, Psychiatrist and Lecturer, Faculties of Law and Medicine, University of Ljubljana, Ljubljana, Yugoslavia.
Cooperating group(s): Research Fund Boris Kidric, and Department of Health and Welfare, S. R. Slovenia; Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.
Publications: Publication planned in December 1972.

THE CHILD IN THE FAMILY

Family Relations

23-LA-1 FAMILY SIZE, CHILDSPACING, AND SOCIOECONOMIC STATUS

Purpose: This is the fourth phase of a longitudinal study of 1,300 Detroit area couples at varying stages in the family growth cycle. (See Research Relating to Children, Bull. Nos. 18-U-1 and 20-LG-1.) This phase attempts to determine changes in family expectations and pregnancy history, as well as shifts in economic situation, and tests some of the hypotheses explored in earlier phases of the study.
Subjects: 94 percent of the 1,300 white, married Detroit Metropolitan women initially interviewed in 1962 and still eligible for the study; a cross-section sample of 3,350 Detroit couples married in 1961 for whom premarital pregnancy status was ascertained; two national samples from 1955 and 1961 Growth of American Families data.
Methods: The original sample was interviewed for the fourth time in the Fall of 1966 with regard to pregnancy histories, spacing of children, and an array of social and economic characteristics. Multivariate analysis will emphasize the social and economic correlates of varying childspacing patterns.
Duration: June 1966-May 1969.
Investigator(s): Ronald Freedman, Ph.D., Director, and Lolagene Coombs, M.A., Research Associate, Population Studies Center, University of Michigan, Ann Arbor, Mich. 48104.
Cooperating group(s): Social Security Administration, U. S. Department of Health, Education, and Welfare.
Publications: A number of publications are planned as the research progresses.

23-LA-2 FAMILY STRUCTURE, PARENT CHARACTERISTICS, AND CHILD PERSONALITY

Purpose: To investigate the relationships between parental acceptance of the child and each of several child characteristics; to investigate the effects of family structure, family communication patterns, socioeconomic status, and sex, birth order, and I.Q. of the child upon these relationships.
Subjects: 64 children drawn at random from the three main Topeka high schools according to the following criteria: ages 15 to 16, evenly divided with regard to sex and birth order, of middle class families with both parents living in the home, and school I.Q. between 100 and 119; their families.
Methods: Parents are interviewed, children are given a variety of tests, and the Revealed Differences Technique is used to obtain data on family interaction patterns.
Duration: October 1967-June 1973.
Investigator(s): Alfred F. Glixman, Ph.D., Senior Research Psychologist, The Menninger Foundation, Box 829, Topeka, Kan. 66601.

23-LA-3 FAMILY FACTORS AND EMOTIONAL ADJUSTMENT PATTERNS IN DISADVANTAGED MEXICAN-AMERICAN CHILDREN

Purpose: To investigate family variables, such as role perception and childrearing attitudes, associated with children identified as high or low in adjustment, and language variables; specifically, to develop a solid descriptive base for use in designing an action program.
Subjects: 150 lower class Mexican-American children; families of 30 of them.
Methods: All of the children were rated by teachers on behavior and language functioning. The families of 30 children with extreme ratings were administered semantic differentials, childrearing attitude scales, and a social data instrument. Children were rerated for behavior after eight weeks to test the reliability of the rating.
Findings: There appears to be a strong positive correlation between language functioning and behavior rating. Rating scale appears reliable.
Duration: June-November 1968.
Investigator(s): James M. Stedman, Ph.D., Coordinator of Research and Inservice Training, Community Guidance Center, and Richard E. McKenzie, Ph.D., Chief of Behavioral Assessment, School of Aerospace Medicine, and Staff Psychologist, Community Guidance Center, 2135 Babcock Rd., San Antonio, Tex. 78229.
Cooperating group(s): Dr. Grover Cunningham and staff, Child Development, Evaluation, and Research Institute of the Southwest, University of Texas, Austin, Tex.
Publications: Publication planned.

23-LA-4 FAMILY PATTERNS RESEARCH: STUDY OF FAMILY INTERACTION AND DECISIONMAKING PROCESSES

Purpose: To study the differing interaction patterns, decisionmaking processes, and problem-solving modes of families having children with (1) functional reading disabilities, (2) hyperaggressive behavior problems, or (3) neither of the above.
Subjects: Boys, ages 9 to 12, noninvolved psychiatrically, of average or higher I.Q., and from intact homes; their parents. Subjects are selected from public school rosters according to reading levels, behavioral ratings, etc.
Methods: Parents and son work individually, in all possible dyads, and in triads on a button-pushing task requiring solution of sequence in which buttons are pushed. Indices of accuracy, cooperation, power, flexibility, etc., are objectively derivable. Comparisons of families, fathers, mothers, sons, father-son, mother-son, and mother-father teams constitute the primary mode of analysis.
Findings: There are distinct patterns between the three types of families. Those having children with reading problems are least flexible and adaptive and show a unilateral power structure unrelated to skill, with the father more powerful than the mother, and the mother more powerful than the son. Families having a child with a behavior problem are more flexible, with the mother the most powerful. Control families are the most flexible, with the father more powerful than the mother, but surrendering power to the son.
Duration: September 1962-June 1968.
Investigator(s): Eric A. Bermann, Ph.D., Assistant Professor, Department of Psychiatry, and Staff Psychologist, Children's Psychiatric Hospital, and Daniel R. Miller, Ph.D., Professor of Psychology, University of Michigan, Ann Arbor, Mich. 48104.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Journal article or monograph planned.

23-LC-1 FAMILY SIZE AND ACADEMIC ACHIEVEMENT

Purpose: To study the effects of family size on academic achievement.
Subjects: 302 upper-middle class seventh and eighth grade children, 155 boys and 147 girls.
Methods: Analyses of variance and covariance will be performed using academic achievement (both grade point averages and achievement test scores) as the dependent variable and family size as the independent variable.
Duration: June 1967-June 1968.
Investigator(s): Mark Oberlander, Ph.D., Research Analyst, and Noel Jenkin, Ph.D., Director of Research, Institute for Juvenile Research, 232 E. Ohio St., Chicago, Ill. 60611.
Publications: To be published in professional journals.

23-LC-2 MILITARY PSYCHIATRY: IMPACT OF FATHER ABSENCE ON PERSONALITY FACTORS OF CHILDREN

Purpose: To study effects of programmed career-relevant father/husband absence on psychosocial development of five- to eight-year-old boys, maternal coping methods, and family roles and relationship to the community; to examine the process of reintegration of the returning father and the elements influencing persistence of any change observed.
Subjects: Career military families.
Methods: Parents are interviewed and broad-range questionnaires and objective psychological scales are administered. Children are evaluated through projective testing and teachers' ratings.
Findings: There is a variability of coping styles, some enduring family role changes, and a suggested hiatus in psychosocial development.
Duration: 1963-1970.
Investigator(s): Colonel Stewart L. Baker, M.D., Chief, Department of Psychiatry and Neurology, and Major Laurence A. Cove, M.D., Assistant Chief, Child Psychiatry Service, Department of Psychiatry and Neurology, Walter Reed General Hospital, Walter Reed Army Medical Center, Washington, D. C. 20012.
Cooperating group(s): Medical Research and Development Command, Office of the Surgeon General, Department of the Army, U. S. Department of Defense.
Publications: Papers presented at annual meetings of the American Orthopsychiatric Association, March 1968 and March 1967, and the American Psychological Association, September 1967; available from Dr. Baker.

23-LC-3 PARENTAL EXPERIENCES OF UNWED MOTHERS WHOSE FIRST OUT-OF-WEDLOCK CHILD IS NEAR SCHOOL AGE

Purpose: To update information on the situation of women who kept their first out-of-wedlock child now that this child is about to enter school.
Subjects: As many as possible of the 321 unwed mothers originally seen at time of confinement in a randomly selected group of New York City hospitals. (See Research Relating to Children, Bull. No. 16-Y-30.)
Methods: A semistructured questionnaire is used for field interviews conducted by experienced social workers. The content of the interview will deal with housing, living arrangements, employment and other sources of support, arrangements for child care, subsequent marriages and pregnancies, contacts with the child's father, etc. In addition, mothers are questioned about the child's current and past whereabouts, person or persons primarily responsible for child's care, general health status,

and development and behavior. Most responses are recorded verbatim, with much of data coded and punched for electronic data processing and analysis.

Duration: March 1968-Spring 1969.

Investigator(s): Mignon Sauber, M.A., Director, and Eileen M. Corrigan, M.S.W., Senior Research Associate, Research Department, Community Council of Greater New York, 225 Park Avenue S., New York, N. Y. 10003.

Cooperating group(s): Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.

Publications: Experiences of the Unwed Mother as a Parent, Mignon Sauber and Elaine Rubinstein. New York: Community Council of Greater New York, 1965; monograph to be published by Community Council of Greater New York; journal articles planned.

23-LD-1 LONGITUDINAL STUDY OF FAMILY INCOME DYNAMICS

Purpose: To develop an understanding of the factors that cause family incomes to rise above or sink below the poverty level, the impact of these changes on family attitudes and behavior, and the effect of these changes on family income.

Subjects: Initial sample of 2,000 low income families not headed by an old person; representative national sample of 3,000 families drawn by the Survey Research Center, and including people who become poor.

Methods: Interviews will be conducted for five or six years. Those in comfortable economic circumstances at the first interview will be recontacted briefly by telephone, mail, or doorstep visit to learn whether they have become poor, and if they have, they will be interviewed in full. As children leave the original families, they will become part of the sample. As individuals or families manage to climb out of poverty, they will be followed for several years to provide data on the differences between those who manage to capitalize on their gains and keep advancing and those who fall back.

Duration: Summer 1967-continuing.

Investigator(s): James N. Morgan, Ph.D., Survey Research Center, Institute for Social Research, University of Michigan, Ann Arbor, Mich. 48106. (Reported by Dorcus Carrington, Assistant in Research, Survey Research Center.)

Cooperating group(s): U. S. Office of Economic Opportunity.

23-LD-2 INFLUENCE OF THE FATHER'S JOB AND SOCIAL STATUS ON THE OCCUPATIONAL AND SOCIAL GOALS OF YOUTH

Purpose: To identify specific reward patterns that divert and distract youth from attaining satisfactory vocational adjustments; to investigate the extent to which adolescent boys are motivated to identify with their fathers and to participate in youth cultural functions.

Subjects: 17-year-old boys in four different vocational orientations.

Methods: A variety of Likert-type attitude scales were developed to evaluate motivations. Boys were classified on the basis of four groupings, ranging from college preparatory to potential dropout. Multivariate procedures were employed for analysis of data.

Duration: Not reported-August 1967.

Investigator(s): Robert E. Grinder, Ed.D., Associate Professor of Educational Psychology, School of Education, University of Wisconsin, Madison, Wis. 53706.

Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

23-LF-1 EFFECT ON CHILDREN OF PARENTAL MENTAL ILLNESS

Purpose: To determine whether a developing mental illness and hospitalization of a parent has a deleterious effect on children and, if so, whether direct casework intervention with the child can ameliorate damage.
Subjects: Children of patients hospitalized at the Eastern Pennsylvania Psychiatric Institute; subjects are under age 18 and from intact families in which casework service is being provided to nonhospitalized adult members of family.
Methods: In survey phase, information is collected from adult members of family and from collaterals in order to determine the effect of parental mental illness on children. If this effect is shown to be harmful, demonstration phase will follow in which it will be determined whether direct casework intervention by means of interviews with and on behalf of the child can ameliorate deleterious effects.
Duration: Not reported-continuing.
Investigator(s): Margaret L. Shively, M.S.S., Director of Social Service, William A. Phillips, M.D., Medical Director, and William Warthling, M.S.W., Psychiatric Casework Supervisor, Eastern Pennsylvania Psychiatric Institute, Henry Ave. and Abbottsford Rd., Philadelphia, Pa. 19129.

23-LF-2 FREQUENCY, CAUSES, SOCIAL AND ECONOMIC CONSEQUENCES, AND PREVENTION OF ALCOHOLISM IN FAMILIES WITH LOW INCOME

Purpose: To develop and test methods of case finding for alcoholism in two communities in an attempt to establish a complete universe of low income families with an alcoholic; to test the validity of the case finding through the screening process by means of clinical study; to determine the actual social, economic, and psychological effects on children and family life where there is an alcoholic father; to develop conclusions as to the utility of a social survey screening process as a means of case finding of alcoholics in large population groups.
Methods: Development of rosters of low income families with problems of alcoholism in one highly developed urban and one rural community. Included are demographic analyses, plotting of low income neighborhoods, documentation of customs and social mores of the people, identification of locales and occasions for drinking behavior, and an analysis of existing records or experience of several social institutions with known contacts of alcoholic families or their children. Interview schedules are then used to obtain identifying data on family composition and characteristics and specific information from the husband and wife. Subsequent study will include clinical validation of suspected alcoholics, analysis of social screening with statistical measures of validity and reliability, and analysis of community data with relation to screening findings and clinical validation.
Duration: 1967-1969.
Investigator(s): Sroboljub Stojiljkovic, M.D., Professor of Psychiatry, University of Belgrade School of Medicine, and Momcilo Kilibarda, M.D., Social Psychiatrist, and Chief, Mental Health Department, Federal Institute of Public Health, Belgrade, Yugoslavia.
Cooperating group(s): Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.

23-LF-3 INTENSIVE NURSING AFTERCARE FOR PSYCHOTIC MOTHERS

Purpose: To carry out and evaluate a program of intensive aftercare with discharged psychotic mothers of young children.

Subjects: Experimental group of mothers who have been hospitalized for a psychotic disorder; one control group of psychotic mothers and one of normal mothers; children of all groups.
Methods: Visiting nurses will visit mothers in experimental group immediately prior to discharge from hospital and at frequent intervals in their homes over a two-year period afterwards. Aftercare is focused on mother's relationship with her child and deals with the various sequential issues of adaptation to the home and the psychological barriers to adaptive mothering. Assessment of aftercare program will be based on comparison of changes found in visited mothers and control groups in the areas of situational stress, maternal personality, psychopathology, attitudes and behavior, and general and specific aspects of child development and psychiatric status of the child; numerous specific areas based on observed mother-child interaction will also be considered. Further evaluation will involve the study of the intervention process and is designed to reveal information about interactional processes which do and do not lead to desired changes.
Duration: 1967-1971.
Investigator(s): Henry U. Grunebaum, M.D., and Justin L. Weiss, Ph.D., Clinical Associates in Psychiatry; David Gallant, Research Associate, Department of Obstetrics and Gynecology; Carol Hartman, Research Nurse, Harvard Medical School, Boston, Mass. 02115.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

23-LH-1 EARLY LIFE EXPERIENCES AND ADOPTIVE PARENTING: A FOLLOWUP STUDY

Purpose: To study the parental functioning of adoptive couples; to determine what stresses exist for them after they have legally adopted the child and agency service is terminated; to learn what resources the couples utilize in meeting the various stresspoints they experience, and what their attitudes are regarding the helpfulness of these resources.
Subjects: 444 adoptive families whose adoptions from Children's Services of Connecticut were completed between 1957 and 1965.
Methods: Each adoptive family is asked to complete a mailed self-reporting inventory. One hundred couples and their oldest adopted child between ages 5 and 12 are interviewed regarding parental functioning; parents will also complete the Hurvitz's Marital Roles Inventory.
Duration: July 1967-June 1969.
Investigator(s): Philip Starr, M.S.W., Research Department, Ruth Taft, M.S.W., Adoption Department, and Delores A. Taylor, M.S.W., Research Director, Children's Services of Connecticut, 1680 Albany Ave., Hartford, Conn. 06105.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

23-LH-2 COMMUNICATION BETWEEN MOTHER AND CHILD IN ADOPTION

Purpose: To further investigate communication patterns between mother and child concerning feelings and information about adoption through a followup study of families whose adopted child was placed by the Boston Children's Service Association.
Subjects: 55 families in which the first adopted child is now between the ages of ten and twelve.
Methods: Single semistructured interview held with each mother included questions relating to: demographic data; comparison between the type of

BEST COPY AVAILABLE

child first requested and child actually placed; themes used to interpret adoption; facts given without asking; feedback questions from the child; relatives' and schools' knowledge of adoption; how background information given by agency either orally or in writing has been remembered and used; expressed anxieties about later questions or sexual acting out; and degree of integration of the adopted child into the family unit.
Duration: 1965-June 1968.
Investigator(s): Constance Rathbun, M.S.W., Director of Research, and Helen McLaughlin, Caseworker, Boston Children's Service Association, 3 Walnut St., Boston 02108; Chester Bennett, Ph.D., Professor, Department of Psychology, Boston University, Boston, Mass. 02215.
Publications: To be published in Child Welfare.

Childrearing

23-MA-1 PATTERNS OF PARENTAL AUTHORITY

Purpose: To identify current patterns of childrearing attitudes and practices concerned with authority, rationality, autonomy granting, and punitiveness; to compare contrasting clusters of parents in order to ascertain the extent to which their children differ on such attributes as achievement motivation, disruptive behavior, helpfulness to peers, independence, and leadership.
Subjects: 150 families equally divided with regard to sex of nursery school child studied, selected from among families with children over three and one-half attending a public, private, or cooperative nursery school in the Berkeley area; additional group of 100 families.
Methods: Direct observation is stressed. Each child is observed for three months in the nursery school setting, is administered a Stanford-Binet, Form L-M, and rated on a 72-item Q-sort. Parents in the 150-family group are studied intensively. They are observed, independently, in interaction with their children during two three-hour visits to the home. The mother and father are also interviewed separately, then rated by the observers on a set of scales which parallel scales from a Parent Attitude Inquiry previously completed by the parent. Parents in the 100-family group complete a self-report inquiry and their children are observed over a prolonged period in the nursery school setting.
Duration: January 1967-December 1969.
Investigator(s): Paul H. Mussen, Ph.D., Professor, and Diana Baumrind, Ph.D., Associate Specialist, Department of Psychology, University of California, Berkeley, Calif. 94720.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Findings will be reported in the usual professional journals. Some working documents, including a manual for the Preschool Behavior Q-sort, are available.

23-MB-1 CHILDREARING IN INUVIK, N. W. T.

Purpose: To study relations between Indian, Eskimo, and métis-Indian children and their adult socializers or peer caretakers in a recently established Arctic town.
Subjects: Opportunistically selected parents and children.

Methods: School records of the entire resident population of children ages 7 to 18 have been examined. Subjects are observed, informal interviews are held, and available records studied. An attempt will be made to compare childrearing practices with those in more traditional Arctic and sub-Arctic settings.
Duration: February 1967-September 1968.
Investigator(s): John J. Honigmann, Ph.D., Professor of Anthropology, and Irma Honigmann, B.A., University of North Carolina, Chapel Hill, N. C. 27515.
Cooperating group(s): Northern Coordination and Research Centre of the Department of Indian Affairs and Northern Development, Government of Canada; Institute for Research in Social Science; National Science Foundation.
Publications: Papers will be published or presented at appropriate conferences.

23-MB-2 RELATION OF LACTATION TO MATERNAL BEHAVIOR

Purpose: To study statistical relationships between lactation and certain other aspects of maternal behavior.
Subjects: 208 mothers of babies from one to two months old.
Methods: The women were asked to fill out a checklist concerning their behavior toward their infants at the time of their postpartum obstetrical visit. Thirty-eight pairs of lactating and non-lactating mothers, matched for education and parity, were formed, and data are being collected.
Findings: Breastfeeding was practiced significantly more by college-educated women. Three items of maternal behavior on the Wilcoxon Matched-Pairs Signed Rank Test indicated no significant differences between the lactating and non-lactating mothers. The fourth item, concerning sleeping and resting in the same bed with the baby, was significant.
Duration: October 1965-October 1968.
Investigator(s): Niles Newton, Ph.D., Assistant Professor, Division of Psychology, Northwestern University Medical School; and Carolyn Rawlins, M.D., Attending Obstetrician, St. Margaret Hospital, Chicago, Ill. 60611.
Cooperating group(s): John R. and Doris J. Haire Foundation.

23-MB-3 EFFECTS OF EARLY CONTACT WITH INFANT ON MATERNAL COMPETENCE

Purpose: To study the influence of separation of premature infant and mother on maternal behavior and infant growth and development.
Subjects: Intact families of premature infants living in the mid-peninsula area.
Methods: Parents are interviewed and mother-infant interaction is observed. Developmental tests are administered to infants.
Duration: January 1967-December 1971.
Investigator(s): P. Herbert Leiderman, M.D., Associate Professor of Psychiatry, School of Medicine, and Clifford R. Barnett, Ph.D., Associate Professor of Anthropology, Stanford University, Palo Alto, Calif. 94305.
Cooperating group(s): Grant Foundation; National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Publications planned in Fall 1968 and thereafter.

23-MB-4 CHILDREARING AND COGNITIVE DIFFERENTIATION IN CHILDREN OF LOWER SOCIOECONOMIC STATUS

Purpose: To investigate the importance of certain aspects of childrearing in relation to children's readiness for and achievement in school.
Subjects: 200 Negro kindergarten children of lower socioeconomic status; their mothers.
Methods: Children are administered three tests: Embedded Figures Test for Children (visual field dependence), Wepman Auditory Discrimination Test, and Wechsler Prekindergarten and Primary Scale of Intelligence. In addition, samples of spontaneous speech of the children will be collected in the classroom. Mothers are interviewed by Negro women using an extensive home interview schedule.
Duration: January 1967-December 1970.
Investigator(s): Martin Deutsch, Ph.D., Director, Institute for Developmental Studies, and Professor of Early Childhood Education, New York University School of Education, New York, N. Y. 10003. (Reported by Mary Eisman, Associate Research Scientist, Institute for Developmental Studies.)
Cooperating group(s): The Campus School Program, New York City Board of Education; National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Preliminary findings on the home interview will be available January 1969. A final report will be available through the Institute for Developmental Studies.

SOCIOECONOMIC AND CULTURAL FACTORS

23-NA-1 CULTURES IN CONFLICT--HOME AND SCHOOL AS SEEN THROUGH THE EYES OF LOWER CLASS STUDENTS

Purpose: To investigate the extent of subculture conflict perceived between middle class oriented public schools and low income groups; to determine what features of the home or school environment aggravate or mitigate these conflicts.
Subjects: 100 students from low income families.
Methods: Taped interviews were held, and analysis focused on conflicts of role models, values, cognitive style, and career expectations of low income groups. Results were applied to the formulation of hypotheses regarding specific problems encountered in public schools, the manner in which students cope with these problems, and ways to mitigate the home-school conflict.
Duration: February 1967-January 1968.
Investigator(s): Deborah I. Offenbacher, Ph.D., New School for Social Research, New York, N. Y. 10025.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Preliminary report available; final report planned at end of 1968.

23-NA-2 PARENT-STUDENT PROJECT

Purpose: To delineate the varying subcultures among students at Berkeley, and to investigate the links between student organizations and parental characteristics.
Subjects: 481 Berkeley students selected at random; their parents.
Methods: A two-hour interview, covering a wide range of topics, was held with 85.2 percent of the sample, and a mail questionnaire, taking about 40 minutes to complete, is being sent to the parents. Analysis of data is in progress.
Duration: January 1968-January 1969.
Investigator(s): Shirley A. Star, Ph.D., Lecturer, and Jonathan Kelley, B.A., Ph.D. Candidate, Department of Sociology, University of California, Berkeley, Calif. 94720.
Cooperating group(s): Committee on Research, University of California, Berkeley.
Publications: Book planned for 1969.

23-NA-3 A SOCIOLOGIC STUDY OF INDIGENT PRIMIGRAVID PREGNANCY

Purpose: To test the hypotheses that: (1) different patterns of behavioral and attitudinal adaptation to pregnancy exist among indigent primigravid patients both between Negro and white patients and within

1403

these two groups; (2) these different patterns of behavioral and attitudinal adaptation are associated with cultural and structural characteristics of the social environment; (3) the association between characteristics of the social environment and adaptation to pregnancy is mediated through intervening social psychological variables such as alienation, achievement motives, authoritarianism, and anxiety; and (4) the different patterns of behavioral and attitudinal adaptation are related to pregnancy outcome.
Subjects: 1,000 indigent primigravid patients at Grady Hospital, Atlanta, Ga.
Methods: Data collected on subjects will permit analysis of relationships between independent, intervening, and dependent variables. Independent variables will include cultural and structural characteristics of the social environment, such as social background characteristics of subjects; intervening variables will consist of social-psychological characteristics of the subjects; and dependent variables will be attitudes and practices relating to pregnancy and pregnancy outcome.
Duration: July 1968-June 1969.
Investigator(s): William L. Graves, M.A., Assistant Professor, Department of Sociology, and Associate in Medical Sociology, and Malcolm G. Freeman, M.D., Perinatal Pathologist, and Director, Reproductive Wastage Study Project, Department of Obstetrics and Gynecology, School of Medicine; John T. Doby, Ph.D., Professor and Chairman, Department of Sociology, Emory University, Atlanta, Ga. 30303.
Cooperating group(s): Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.

23-NB-1 GENERIC BASES OF NEGRO TEENAGE UNEMPLOYMENT: A PRELIMINARY INVESTIGATION

Purpose: To investigate the educational, psychological, familial, sociological, and situational reasons for the excessively high rate of unemployment among Negro teenage youth in rural communities; to develop a plan for further research into the problem of constructing and operating a remedial program tailored to meet the needs of these youth.
Subjects: Stratified sample of 256 out-of-school teenage youth in two adjacent rural counties in North Carolina who graduated or dropped out of high school in 1966.
Methods: Subjects are interviewed regarding their job-hunting techniques, knowledge of the job market, employment experience, aspirations, and self-images, as well as family background, education, and training. Responses given in interviews with a sample of employers and school officials will be used in an evaluation of job opportunities, community attitudes, and the adequacy of educational and training facilities available to Negro youth in the area.
Duration: July 1967-September 1968.
Investigator(s): Dr. Charles H. Rogers, Center for Occupational Education, North Carolina State University, Raleigh 27607; and Benjamin Harris, North Carolina Agricultural and Technical College, Greensboro, N. C. 27411.
Cooperating group(s): Manpower Administration, U. S. Department of Labor.

23-NB-2 LONGITUDINAL STUDY OF LABOR FORCE BEHAVIOR

Purpose. To identify and explore the interaction among economic, sociological, and psychological variables influencing work behavior and experience.
Subjects: Young men and women, ages 14 to 24, men, 45 to 59, and women, 30 to 44.

Methods: Six consecutive interviews will be held a year apart with each of the four groups. The initial interviews include extensive work histories and information which will permit construction of psychometric and sociometric profiles of the respondents. All interviews will involve in-depth questions on labor force behavior and motivation.
Duration: 1966-1975.
Investigator(s): Herbert S. Parnes, Ph.D., Center for Human Resource Research, Ohio State University, Columbus, Ohio 43210.
Cooperating group(s): Manpower Administration, U. S. Department of Labor.
Publications: Report covering the findings of the initial interviews for older and younger men planned for 1968.

23-NC-1 PERSONALITY CORRELATES OF POLITICAL AND SOCIAL ATTITUDES

Purpose: To investigate the personality correlates of political and social attitudes, with emphasis upon the correlates of attitudes about civil rights.
Subjects: Public and parochial high school students.
Methods: Samples of Negroes and whites will be compared on a scale measuring militancy of civil rights attitudes. Scores on this scale will be correlated with scores on tests of several personality traits, such as aggressiveness and self-control. The effects of various experimental techniques used to alter the degree of militancy expressed by subject groups will be evaluated by analysis of variance.
Duration: April 1967-April 1969.
Investigator(s): Elise E. Lessing, Ph.D., Senior Research Associate, Institute for Juvenile Research, 232 E. Ohio St., Chicago, Ill. 60611.
Publications: Publication planned in professional journals.

23-NC-2 ADOLESCENT PARTICIPATION IN CIVIL DISTURBANCES

Purpose: To investigate the types of participation of adolescents in three civil disturbances associated with Negro college campuses; specifically, to study the roles taken by the students in the disorder as a function of their affiliation with schooling and the controls which developed to limit the disorder.
Subjects: College and high school students, and nonaffiliated adolescents who participated in civil disorders in Houston, Tex., Jackson, Miss., or Nashville, Tenn. in the Spring of 1967.
Methods: Data collected through interviews and documentary sources.
Duration: October 1967-June 1968.
Investigator(s): J. R. Newbrough, Ph.D., Associate Professor of Psychology, and Coordinator, and Ethyl Metcalfe, M.Ed., Center for Community Studies, George Peabody College for Teachers, Nashville, Tenn. 37203.
Cooperating group(s): Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.

23-NF-1 A STUDY OF RACE AND ATTITUDES TOWARD SCHOOL

Purpose: To explore the attitudes of children, particularly Negro slum children, toward school and learning; to develop valid and reliable ways of carrying out such attitude measurement.
Subjects: White and Negro children in grades one and two.

Methods: Children are individually shown specially prepared sketches of classroom events designed to elicit perceptions of teacher helpfulness and reward/punishment structure of the classroom. In a racial preference test, also administered individually, children indicate which of two school classes, one predominantly white, one predominantly Negro, learns best, has the nicest children, etc. Finally, in a group administered social distance test, children place figures representing themselves in a two dimensional space with figures representing school, home, and peers.
Findings: In the racial preference test, white children in an integrated and in an all-white school showed an overwhelming preference for the predominantly white classrooms, while Negro children in an integrated and an all-Negro school showed no strong preference for either white or Negro classrooms. Test-retest reliability with four week interval was .63.
Duration: June 1966-June 1969.
Investigator(s): Sandra R. Cohen, Ph.D., Research Psychologist, Developmental Research Division, Educational Testing Service, Princeton, N. J. 08540.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Plan to report in Research Bulletin series of Educational Testing Service; also journal publication and possibly monograph or book.

23-NF-2 GENERALIZATION OF STATUS CHARACTERISTICS

Purpose: To study the phenomenon of the self-fulfilling prophecy. When Negro and white work together on a new cognitive task, there is a tendency for the general social expectations of Negro inferiority to diffuse into the new situation. The white expects the Negro to do less well, and the Negro accepts this evaluation of his competence. Thus, the stage is set for a self-fulfilling prophecy; the whites turn out to be more active and competent in the new task, and the Negroes play a less active, competent, and influential role. This process goes on independently of the actual competence of the individuals.
Subjects: Balanced groups of lower class white and Negro high school boys.
Methods: Boys are compared in rates of performance output on a standardized problem-solving game. In an experimental treatment, the Negro participants are given more information, and their influence and performance, which are expected to increase under these circumstances, are observed. All participants will again play the game to determine whether expectations about performance have changed as a result of the experiment and whether they have generalized to another situation.
Duration: September 1967-September 1969.
Investigator(s): Elizabeth G. Cohen, Ph.D., Assistant Professor of Education, Stanford University, Stanford, Calif. 94305.
Cooperating group(s): National Science Foundation.

23-NF-3 RELATIONSHIPS BETWEEN INTELLIGENCE AND PARENTAL ATTITUDES AND RACE AWARENESS IN FIVE-YEAR-OLDS

Purpose: To investigate relationships between children's awareness of race, their intelligence, and the race attitudes of their parents; specifically, to determine extent to which children of parents with a segregation point of view evidence race awareness as compared to children whose parents do not hold this view, and to determine role of intelligence of preschool children in applying race awareness to social groupings.

Subjects: 60 five-year-old white boys and girls from middle class neighborhoods who attended Protestant church kindergartens in Charlotte, N. C.
Methods: The Lorge-Thorndike Intelligence Test was administered to the children, and a Likert Scale composed of 10 items from recent civil rights legislation was administered to the parents. Children were then divided into two groups and scored on time for conceptualizing three dolls as a family unit of mother, father, and child. In one group, all white dolls were used; in the other, a Negro child doll was substituted for the white doll.
Findings: No relationship between I.Q. and the speed of conceptualizing the family was found. There was no difference in time for conceptualization between the two groups and no relationship between parental attitudes and the speed of conceptualizing either a mixed or an all white doll family.
Duration: Completed.
Investigator(s): Louis Diamant, Ph.D., Chairman, Department of Psychology, University of North Carolina, Charlotte, N. C. 28202.
Publications: *Journal of Social Psychology*, in press, 1968.

23-NF-4 RACE OF EXAMINER AS A VARIABLE IN RESEARCH WITH CHILDREN

Purpose: To investigate the role of an examiner's race on the intellectual performance of Negro and white children.
Subjects: 10 white boys, 10 white girls, 10 Negro boys, and 10 Negro girls, all ages five to eight.
Methods: Matched groups of white and Negro children were tested by either a white or Negro student examiner on the WISC and data analyzed.
Duration: June-November 1968.
Investigator(s): Norman Solkoff, Ph.D., Associate Professor of Psychology, State University of New York, Buffalo, N. Y. 14214.
Publications: Publication planned in psychological journal.

23-NG-1 INFANT DEVELOPMENT AMONG THE ZINACANTECO INDIANS OF CHIAPAS, MEXICO

Purpose: To evaluate inborn behavioral characteristics of infants of an isolated Indian group, the Zinacantecos; on the basis of mothering practices, to see the effect of their environment on their innate characteristics to produce their special development.
Subjects: 102 infants, newborn to age nine months.
Methods: A behavioral-neurological assessment of each infant is made three times in the first week following delivery. Bayley Scales are administered monthly, and Rheingold's Schemata are used in twelve four-hour observations of mother-infant interaction.
Findings: Infants are highly monitored motorically at birth and carried in a serape which essentially swaddles them; they are never put out to be played with, and an infant's cry is met with an immediate quieting response, such as frequent breastfeeding. Thus, infants are quiet, very alert to sensory stimuli, and nonexploratory.
Duration: June 1966-September 1967.
Investigator(s): T. Berry Brazelton, M.D., Clinical Associate in Pediatrics, and John S. Robey, M.D., Instructor in Pediatrics, Harvard Medical School, Boston, Mass. 02115.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: *Pediatrics*.

23-NG-2 TRANSITIONAL OPPORTUNITIES PROJECT FOR STUDENTS OF INDIAN BOARDING SCHOOLS

Purpose: To demonstrate the effectiveness of an acculturation program for students of Indian boarding schools.
Subjects: 45 students from the Flandreau Indian School, Flandreau, S. D.; control group of 45 other students from the same class.
Methods: Over a three-year period, experimental group will be provided with supervised weekend and summer experiences including living with host families in nearby communities, cultural, recreational, and educational programs, and employment opportunities when indicated; emphasis is on involvement of students in normal family and community activities. Educational, social, and cultural adjustments of these students will be assessed during and following three-year period and compared with adjustment of controls.
Duration: August 1967-July 1969.
Investigator(s): John D. Little, M.S.W., Project Director, Fern L. Chamberlain, M.S.S.A., Research Specialist, and Milton Erickson, Director of Special Projects, Lutheran Social Services of South Dakota, 600 W. 12th St., Sioux Falls, S. D. 57104.
Cooperating group(s): Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.

23-NG-3 CEBU FAMILY HEALTH PROJECT

Purpose: To describe in detail the cultural and social factors surrounding specific patterns of childbirth, childcare patterns, and, in general, the reproductive behavior of Cebuano couples.
Subjects: Randomly drawn sample of 3,000 couples (2,400 in the urban center and 600 in the rural barrios) in the Province of Cebu, Republic of Philippines.
Methods: Survey interview, social psychological techniques, and ethnological interviews.
Duration: September 1967-September 1969.
Investigator(s): William T. Liu, Ph.D., Professor of Sociology, and Director, Institute for the Study of Social Change, University of Notre Dame, Notre Dame, Ind. 46556.
Cooperating group(s): San Carlos University, and Cebu Medical Institute, Cebu, Philippines; Agency for International Development, U. S. Department of State.
Publications: Progress Reports I-IV, February, April, July, and September 1968; three monographs planned.

23-NG-4 ATTITUDES TOWARD LEARNING SPANISH AMONG QUECHUA- AND AYMARA-SPEAKING SCHOOL CHILDREN

Purpose: To analyze differences among Peruvian Altiplano school children in linguistic background, socioeconomic status, place of residence, etc. with regard to their attitudes toward Spanish and social change in general.
Subjects: Fifth grade children in four provinces of the Department of Puno.
Methods: Administration of questionnaires in classrooms.
Duration: 1966-1969.
Investigator(s): Erwin H. Epstein, Ph.D., Assistant Professor, Department of Educational Policy Studies, University of Wisconsin, Madison, Wis. 53706.
Cooperating group(s): Ibero-American Area Studies Committee; University of Wisconsin Graduate School Research Committee.

EDUCATIONAL FACTORS AND SERVICES

General

23-OA-1 THE EFFECTS OF THE COLLEGE EXPERIENCE UPON STUDENT OPINIONS AND ATTITUDES

Purpose: To sample attitudes and opinions of Simmons College undergraduates at repeated intervals, using both equivalent populations at different times, and the same population at different stages in the college experience.
Subjects: Random samples, stratified as appropriate, of the College undergraduate body.
Methods: Chiefly use of test instruments from the Institutional Research Program for Higher Education of the Educational Testing Service: the College and University Environment Scales (CUES) and the College Student Questionnaires (CSQ-1 and CSQ-2). Locally devised questionnaires and test devices used in addition.
Duration: September 1965-continuing.
Investigator(s): J. Garton Needham, Ph.D., Director of Institutional Studies, Simmons College, Boston, Mass. 02115.
Publications: Two reports available from Dr. Needham.

23-OA-2 THE EDUCATIONAL PARK

Purpose: To study the impact of concentrated educational facilities on pupils, parents, the community-at-large, and intergroup tensions.
Subjects: Pupils in Head Start through twelfth grade.
Methods: A concentrated educational facility will be created through a cooperative effort of teachers, administrators, city planner, transportation specialist, architect, space designer, economist, and sociologist.
Duration: February 1967-October 1968.
Investigator(s): Max Wolff, Ph.D., Senior Research Sociologist, Center for Urban Education, 105 Madison Ave., New York, N. Y. 10016.
Publications: Superintendent of Documents, U. S. Government Printing Office.

23-OB-1 CENTRAL UTAH PROJECT ON INDIVIDUALIZATION OF INSTRUCTION

Purpose: To identify, diagnose, and analyze behavioral patterns of children at an early age, and to program to meet these needs.
Subjects: Pupils in kindergarten through third grade in the Provo School District.
Methods: Individual inventories describing the needs of each child are written by the teachers in kindergarten, first and second grades and analyzed by a team of specialists consisting of teacher, principal, school psychologist, social worker, nurse, speech and hearing therapist, primary supervisor, and resource teacher when available. A child needing help is

referred to the specialist most able to help him. Because learning is complex and involves more than academic achievement, all aspects of behavior are considered in organizing a program. Constant evaluations are made to determine program adjustments, and appropriate followup procedures are employed. Parents are often involved in programming.
Findings: During the spring of 1967, 75 kindergarten children were referred to specialists for individual attention. Of these, followup was necessary for 47. Because of an increased awareness of the individual needs of children, teachers have shown a greater commitment to help the child.
Duration: January 1967-June 1970.
Investigator(s): Vern Brimley, M.A., Director of Federal Programs, Provo School District, Box 816, Provo, Utah 84601. (Reported by Dr. Sherman W. Wing, Superintendent, Provo School District.)
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Dissemination material available.

23-OB-2 THE EFFECT OF A GROUP GUIDANCE PROGRAM UPON SELF-ESTEEM, INTERPERSONAL RELATIONSHIPS, AND EDUCATIONAL ACHIEVEMENT OF THE CULTURALLY DIFFERENT CHILD

Purpose: To implement and specify the influence of certain group guidance programs upon personal adjustments as seen in self-esteem, socially significant attitudes and behavior, and educational achievement of culturally different students.
Subjects: 200 elementary public school children in grades four and five who are identified as culturally disadvantaged by an integrated school district.
Methods: Control and experimental groups, composed of 100 students each, were randomly selected. Data collection involves both groups. Control group receives no additional attention; experimental group is given problems, through film slide or story, which are common to them, e.g., a one-parent home, and a group of 11-15 students is encouraged to discuss the problem. Scales, tests, and magnetic tapes of each session will be used in the evaluation. The Scientific Data System, Model Sigma 7, will be utilized for a statistical analysis of the data.
Findings: Preliminary analysis of pre- and posttest and scales scores indicates positive gains for the experimental groups in school attendance and overt behavior. Data have been submitted to statistical treatment for an analysis of variance and product moment correlation.
Duration: February 1968-January 1969.
Investigator(s): Charleta J. Dunn, Ed.D., Assistant Professor, Department of Guidance and Counseling, University of Houston, Houston 77004, and Bill F. Payne, M.A., Consultant, Division of Guidance Services, Texas Education Agency, Houston, Tex.
Cooperating group(s): Fort Bend, Ind. School District; Hogg Foundation for Mental Health.
Publications: Monograph will be published describing materials, methodologies, and conclusions.

23-OE-1 DEVELOPMENTAL RESOURCE CENTER

Purpose: To set up a demonstration center focusing on the problems of school readiness and developmental grouping as well as developing both preventive and remedial perceptual training programs for primary children.

Subjects: 1,600 children in kindergarten through third grade, housed in five elementary schools.
Methods: Five developmental examiners have been trained over the period of one year to administer the Gesell Developmental Examination. The 10-minute screening section is given to preschool children prior to entrance in kindergarten. Children are then divided into five maturity levels for prekindergarten or kindergarten placements which cut across levels of intelligence. The following spring they are given the full 30-minute test battery for placement in kindergarten, readiness, or first grade. They continue to receive an annual examination until third grade, but may receive one at any time upon the request of either home or school. Perceptual training for kindergarten, readiness, and first and second grade using the problem-solving approach is given one-half hour per day with the program developed during 18 workshop sessions at the Gesell Institute.
Findings: Trends indicate superiority of developmental placement especially in kindergarten and first grade. Levels of achievement are rising, and referrals for special services are diminishing.
Duration: September 1967-June 1971.
Investigator(s): Richard Walker, Ph.D., Research Psychologist, Gesell Institute of Child Development, 310 Prospect St., New Haven 06511; and Marilyn Levy, M.A., Research, Board of Education, Cheshire Public Schools, 84 S. Main St., Cheshire, Conn. 06410. (Reported by Gwynette T. Caruthers, Department of Education, Cheshire.)
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Publications planned in 1969.

23-OE-2 THE USE OF REMEDIATION TECHNIQUES DEVELOPED ON THE BASIS OF THE ILLINOIS TEST OF PSYCHOLINGUISTIC ABILITIES ON KINDERGARTEN CHILDREN

Purpose: To study the effectiveness of working with special suggested guides based on the 10 areas of diagnostic evaluation on the ITPA.
Subjects: A selected group of approximately 160 kindergarten children showing a lower readiness age on the ABC Inventory prior to school entrance.
Methods: In 1967 a middle class and a lower-middle class to deprived school were selected from an all-white school system of 6,600. A kindergarten class in each school was administered the ABC Inventory and differences in readiness age identified. At the end of the year standard test results were compiled on the Metropolitan Reading Readiness Test and a reading test. In the spring of 1968 incoming kindergarten children were evaluated on the same instrument and divided into two classes, A and B. At the beginning of the 1968 school year, teachers of the B group were given guides for working with their group which had been developed by researchers and teachers involved with the culturally handicapped and the ITPA categories for communication learning. A psychologist will meet twice weekly with a small group of B students using operant techniques with the lowest achievers to determine whether this approach can bring about results at this age. Children will be followed through primary grades.
Findings: The readiness test did identify children who later showed their inability to work on a kindergarten level or to be ready for first grade.
Duration: September 1967-June 1970.
Investigator(s): Esther Yalowitz, M.S., School Psychologist, and David Kashey, M.A., Director of Curriculum, Pekin Public Schools, 501 Washington, Pekin, Ill. 61604.
Publications: Data and results available from Mrs. Yalowitz.

23-OF-1 THE SECOND TIME AROUND: A STUDY OF ACHIEVEMENT AND PROGRESS OF BOYS WHO REPEATED ONE OF THE FIRST THREE GRADES IN SCHOOL

Purpose: To identify the significant social and psychological variables associated with academic progress of boys who repeat a primary grade.

Subjects: A total of 57 first, second, and third grade boys who failed and were repeating the grade.

Methods: In-depth interviews were conducted during retained year with boys' mothers to determine familial attitudes toward child and education. Additional data about boys were gathered through semistructured interviews with teachers, principals, and guidance personnel, as well as from cumulative school records and test scores.

Findings: Variables associated with achievement and progress were level of maturity, parental acceptance of child, peer relationships, emotional stability, and time of retention. Most boys had incipient learning problems prior to failed year.

Duration: January-December 1967.

Investigator(s): Helen Reinherz, Sc.D., Associate Professor, and Director of Research, Simmons College School of Social Work, Boston 02116; and Carol Lee Griffin, Ph.D., Psychologist, and Coordinator of Community Education, South Shore Mental Health Center, 1120 Hancock St., Quincy, Mass. 02169.

Cooperating group(s): The Medical Foundation, Inc.; Quincy Public School System.

Publications: Papers delivered at American Orthopsychiatric Association Meeting, March 1968, and American Public Health Association Meeting, November 1968. Publications also planned for appropriate professional journals.

23-OF-2 PROJECT PLAN (PROGRAM FOR LEARNING IN ACCORDANCE WITH NEEDS)

Purpose: To develop a comprehensive system of individualized education designed to significantly improve the achievement of each student.

Subjects: Students in all grades in 14 cooperating school districts throughout the country.

Methods: The student's individual curriculum is developed by himself, with assistance from his teacher, using a flexible set of instructional segments. His educational objectives are selected by a systematic guidance and individual planning program. Information storage and retrieval services of a computer are used to assist student and teacher with test-scoring, record-keeping, data analysis, and matching operations.

Duration: January 1967-1971.

Investigator(s): John C. Flanagan, Ph.D., Chairman, Board of Directors, American Institutes for Research, Box 1113, Palo Alto, Calif. 94302.

Cooperating group(s): Westinghouse Learning Corporation.

Publications: *Phi Delta Kappan* 49:1:27-33, 1967; additional publications planned.

23-OF-3 EDUCATIONAL ACHIEVEMENT AND SOCIAL ADJUSTMENT IN INTELLECTUALLY AVERAGE PHENYLKETONURIC CHILDREN--A PILOT STUDY

Purpose: To study the educational achievement and social adjustment of treated phenylketonuric children.

Subjects: Six treated PKU children at the Vanguard School near Philadelphia.

Methods: Pertinent data were extracted through review of the extensive cumulative folders kept on the children. Selected tests were administered, and children were observed. Teachers and supporting personnel provided interview data, and social maturity information was obtained from appropriate individuals.
Duration: October-December 1967.
Investigator(s): Bartell W. Cardon, Ph.D., Assistant Professor of School Psychology, Pennsylvania State University, University Park, Pa. 16802.
Cooperating group(s): The Devereux Foundation, Devon, Pa.
Publications: Plan to submit for publication.

23-OF-4 THE NATURAL HISTORY OF THE EDUCATION OF THE DEPRIVED NEGRO CHILD

Purpose: To study the learning experiences of selected disadvantaged Negro children in home, school, and peer cultures, concentrating on the experiences of particular children in order to learn why particular ghetto children succeed or fail in school.
Subjects: Disadvantaged Negro kindergarten children; upper-middle class white kindergarten children.
Methods: Kindergarten classes are observed twice weekly for one and one-half hours by five researchers whose observations are dictated after each session and discussed and analyzed. Several children from each class will be selected for observation in the homes according to a teacher's evaluation of "children doing well" or "children doing poorly". "School culture" will be studied by formal and informal interviews with school personnel. Children will be followed through first grade.
Findings: Most cognitive studies are based on experiment with adult-conceived matrices imposed on the child. In Negro ghetto kindergartens, adult matrix often fails, and children do not learn. Investigator calls this phenomenon "anticognition".
Duration: June 1967-May 1970.
Investigator(s): Jules Henry, Ph.D., Professor of Anthropology-Sociology, Washington University, St. Louis, Mo. 63130.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Papers and book planned.

23-OF-5 AN EVALUATION OF A NEW APPROACH IN DEALING WITH HIGH SCHOOL UNDERACHIEVEMENT

Purpose: To determine whether high school achievers differ from normally achieving children in their internal-external expectancy; to test hypothesis that underachievers who are high in externality will improve in academic performance if a change toward more internal attitude is effected.
Subjects: High school underachievers.
Methods: Underachievers who are high in externality are randomly assigned to one of three treatment groups: (1) computer group, where immediate reinforcement of own behavior is provided in learning programming language; (2) tutorial group; and (3) study group approach, where the aim is to improve study habits. The three groups' gain scores are compared on an Internality-Externality scale and on measures of academic performance.
Duration: September 1968-August 1969.
Investigator(s): Alexander Tolor, Ph.D., Director, Institute for Human Development, Fairfield University, Fairfield, Conn. 06430.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Journal publication planned.

23-OG-1 EFFECTS OF EARLY SCHOOL FAILURE ON LATER CAREERS OF JUNIOR HIGH SCHOOL BOYS

Purpose: To study the longitudinal effects of primary grade retention upon the social, emotional, and academic adjustment of junior high school boys.
Subjects: 80 seventh and eighth grade boys, 40 retained in one of the first three grades and 40 not retained. Groups matched for grade level, socioeconomic background, I.Q., and same elementary school.
Methods: School progress, self-concept, and vocational aspirations are studied through in-depth interviews with subjects, administration of a self-concept scale, examination of school cumulative records, and interviews with school guidance personnel.
Duration: January 1968-January 1970.
Investigator(s): Helen Reinherz, Sc.D., Associate Professor, and Director of Research, Simmons College School of Social Work, Boston 02116; and Carol Lee Griffin, Ph.D., Psychologist, and Coordinator of Community Education, South Shore Mental Health Center, 1120 Hancock St., Quincy, Mass. 02169.
Cooperating group(s): The Medical Foundation, Inc.; Quincy Public School System.
Publications: Presented in part at the American Public Health Association Meeting, November 1968; articles planned for appropriate journals.

23-OG-2 PUPIL ADJUSTMENT AS RELATED TO SEX OF TEACHER

Purpose: To compare adjustment in relation to reactions towards self, school, and teacher, of children who have never had a male teacher with that of children who have.
Subjects: One group of elementary school boys and girls who have never had a male teacher and another group who had completed a year's experience with a male teacher.
Methods: Battery of objective measures of self-concept (Mental Health Analysis), teacher approval (Checklist of Trait Names), and pupil attitudes towards school (SRA-school problems) was administered to both groups late in the school year. Results were compared between boys with female teachers only and those with male teachers and between girls with female teachers only and those with male teachers.
Duration: Not reported-August 1967.
Investigator(s): Clayton G. Farrall, Ph.D., Congdon Campus School, State University of New York, Potsdam, N. Y. 13676.
Cooperating group(s): Research Foundation, State University of New York.

23-OG-3 CONCEPTIONS OF JUSTICE AMONG SCHOOL CHILDREN

Purpose: To investigate characteristics of a situation which determine whether arguments of justice or other types of arguments are used.
Subjects: 235 fifth grade children in five different schools in the Oslo area.
Methods: Children were interviewed for periods of 30 to 60 minutes and asked to describe the way their teacher distributes benefits and burdens, such as questions, praise, and punishments. They were further asked to tell how they would prefer these to be distributed and to give reasons for their preferences. In addition, data were gathered on sex, sibling position, relationship with teacher, and general adjustment in class.
Duration: July 1962-December 1967.

Investigator(s): Siri Naess, Research Associate, and Torstein Eckhoff, Institute for Sociology of Law and Public Administration, Fuglehaugate 6, Oslo, Norway. (Reported by NCCD. See Note, p. 72.)
Cooperating group(s): Norwegian Research Council for Science and the Humanities.

23-OJ-1 PARENTAL PARTICIPATION: ITS EFFECT ON THE FIRST GRADE ACHIEVEMENT OF CHILDREN IN A DEPRESSED AREA

Purpose: To determine the effect of parental participation in the education of their children on children's achievement.
Subjects: Children in first grade in 1967-1968 in a depressed area, and their parents; control group of 1966-1967 first grade class whose parents were not actively encouraged to participate.
Methods: Parents are encouraged to assist their children in a learning situation and to cooperate with the school. Achievement mean score and reading achievement scores for the two classes will be compared. Correlation will be determined between reading achievement and reading readiness, intelligence, parents' occupations, and parents' schooling for both classes.
Duration: 1967-1968.
Investigator(s): Florence Heisler, Ph.D., Brooklyn College, City University of New York, Brooklyn 11210; and Edward McCausland, Principal, Mount Avenue School, Wyandanch, N. Y. 11798.

23-OJ-2 ANALYSIS OF HOME ENVIRONMENT AND DEVELOPMENT OF PARENT INTERVENTION PROCEDURES

Purpose: To observe and analyze the home environment of children in Head Start Project, particularly the mother-child interaction; to diagnose the characteristics of the environment which are judged likely to contribute to future poor academic performance by the child; to design and carry out with the mother an intervention program designed to counteract these environmental characteristics.
Subjects: Large, poor, intact white families living in isolated rural areas.
Methods: Data with which to characterize family and home environment will be derived from interviews with mother, observation of mother and child in structured play situations, observation of the family visiting the nursery school, and observation and testing of the child in nursery school. Intervention program consists of weekly visits by a home teacher who introduces activities involving the mother and child which they continue throughout the week. The activities are primarily designed to increase the quantity and quality of verbal interaction between mother and child, to improve their attitude toward school, and to increase the mother's participation in the community.
Findings: Data suggest that the children are well socialized but nonverbal.
Duration: February 1967-November 1971.
Investigator(s): Margaret Parkman, Ph.D., Assistant Professor, and Helen Bayer, Ph.D., Professor, Department of Child Development and Family Relationships, Cornell University, Ithaca, N. Y. 14850. (Reported by Dr. Edwenna R. Werner, Research Associate, Department of Child Development and Family Relationships.)
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Data will be available from Dr. Werner.

23-OK-1 IMPROVING ATTITUDES, CULTURAL UNDERSTANDING, AND THE OPPORTUNITY FOR ACHIEVEMENT

Purpose: To equalize educational opportunities for all students by improving self-concept of minority students; to improve cultural understanding by providing sources of information concerning the cultural contributions of minority people; to improve social attitudes toward different ethnic groups.

Subjects: 81 fifth grade classes from 51 Denver public elementary schools; 15 fifth grade Catholic classes.

Methods: Project has four basic components: (1) 14 color television programs designed to present factual information about Asian Americans, American Indians, Negro Americans, and Hispanic Americans are presented for classroom viewing by students and evening viewing by parents; (2) direct contact equal status activities are planned, including field trips to cultural agencies with "buddies" from other schools and interschool "buddy" exchanges; (3) provision is made for classroom instruction and program enrichment such as Young Audience concerts; and (4) parents will participate via television and evening seminars or programs.

Duration: May 1967-March 1968.

Investigator(s): Joseph E. Brzeinski, Ed.D., Director, Will Howard, M.A., Coordinator, Title III, and Michael Massarotti, M.A., Evaluator, Research Services, Denver Public Schools, 414 - 14th St., Denver, Colo. 80204.

Cooperating group(s): Numerous cultural, civic, and ethnic organizations in Denver.

Publications: Results will be available from Dr. Brzeinski, and from Educational Resources Information Center, Office of Education, U. S. Department of Health, Education, and Welfare.

23-OK-2 THE ELEMENTARY CURRICULUM AS A FACTOR IN RACIAL UNDERSTANDING

Purpose: To determine whether racial cleavage in children can be lessened and the self-concept of Negro and white children improved by a study of the Negro's heritage and his contribution to America; to analyze the influence of community contacts upon racial cleavage and the children's self-concepts.

Subjects: Three groups of eight classes each: experimental group of Negro and white children from the same area; experimental group of Negro and white children from different neighborhoods; control group of Negro and white children from the same area.

Methods: The degree of the children's social, academic, and recreational interaction was measured through a sociometric instrument. All pupils were given the Piers-Harris Measure of Self-Concept and a test to determine their knowledge of the American Negro's history and culture. Only the experimental groups were then taught the textbook unit on "The American Negro"; upon the completion of the unit, all classes were retested and data analyzed to see if any significant differences between groups had developed; calculations were made to determine if an increase in knowledge is related to a reduction in racial cleavage and an improvement in self-concept.

Duration: June 1966-December 1967.

Investigator(s): John Georgeoff, Associate Professor of Education, and Mary Endres, Professor of Education, and Director, Purdue Educational Research Center, Purdue University, Lafayette 47907; Imogene Jones, Elementary School Supervisor, Gary Public Schools, Gary, Ind.

Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

23-OK-3 FACTORS CONTRIBUTING TO ADJUSTMENT AND ACHIEVEMENT

Purpose: To determine the antecedents and concomitants of successful or unsuccessful integration of Negro, Mexican-American, and Anglo children in a public school setting; specifically, to study those characteristics of the child, his parents, and the school as they affect academic achievement and emotional adjustment; to assess both long-term and short-term effects of desegregation.
Subjects: 615 Mexican-American children, 406 Negro children, and 8 children from other ethnic groups, all attending three segregated minority schools, matched by grade with a random sample of 712 Anglo children from formerly all-white schools; all children were in kindergarten through sixth grade in the Riverside Unified School District during the school year 1965-1966.
Methods: Design is basically a seven-year natural time series experiment consisting of a premeasurement and six successive postmeasurements. Matched control groups will provide baselines for evaluating the effects of community sensitization, repeated testing of the sample, and general sociocultural changes occurring over the time span of the study. Extensive multiple measures will be taken of all variables: achievement, personality, and adjustment of the child, parental values and attitudes, and school and teacher characteristics. The impact of desegregation on both the majority and minority child will be evaluated, as will the extent to which these effects feed back through the child to alter family attitudes, values, interaction patterns, and community participation.
Duration: 1966-continuing.
Investigator(s): Harold B. Gerard, Ph.D., Professor of Psychology, University of California, Riverside, Calif. 92502.
Cooperating group(s): National Institute of Child Health and Human Development, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Progress report, University of California, Riverside, May 1968.

23-OK-4 COMMUNICATION PATTERNS IN INTEGRATED CLASSROOMS AND PREINTEGRATION SUBJECT VARIABLES AS THEY AFFECT THE ACADEMIC ACHIEVEMENT AND SELF-CONCEPT OF PREVIOUSLY SEGREGATED CHILDREN

Purpose: To isolate the significant variables which influence the academic success of Negro children who move from segregated to integrated classrooms.
Subjects: All Negro children who attended a segregated elementary school and were moved to integrated classes in schools of the same system.
Methods: Independent variables were pupil characteristics prior to integration and the interaction pattern experienced in the integrated classroom, including the amount of teacher-white pupil, teacher-Negro pupil, and Negro-white verbal interaction. Pupil academic achievement and change in self-concept were the dependent variables. Subjects were tested prior to integration on level of concept formation, cognitive style, self-concept, and occupational aspirations. Sociograms and monthly time samples of verbal interaction between teachers and pupils measured classroom interaction. Academic achievement and self-concept changes were measured following one year of integrated schooling. Multiple regression analyses were used to determine the effect of preintegration pupil characteristics and classroom integration patterns on academic achievement and self-concept.
Duration: 1964-1967.
Investigator(s): Florence L. Denmark, Ph.D., Department of Psychology, Hunter College, City University of New York, New York, N. Y. 10021.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

23-OK-5 "NOT BY THE COLOR OF THEIR SKIN"

Purpose: To explore over a long period of time the impact of increasing integration in a nursery school setting.
Subjects: Students in the Hanna Perkins therapeutic nursery school.
Methods: Mothers were seen weekly, and reports obtained at weekly conferences. Children were observed as a group in the nursery school setting.
Duration: September 1964-September 1968.
Investigator(s): Marjorie McDonald, M.D., Consulting Psychiatrist, Hanna Perkins School, Cleveland Center for Research in Child Development, 2084 Cornell Rd., Cleveland, Ohio 44106. (Reported by Robert A. Furman, M.D., Director, Cleveland Center for Research in Child Development.)
Cooperating group(s): Day Nursery Foundation; Cleveland Psychoanalytic Society Foundation.
Publications: Monograph or article planned.

23-OK-6 CHARACTERISTICS OF NEGRO AND WHITE HIGH SCHOOL STUDENTS PRIOR TO DESEGREGATION

Purpose: To study the impact of high school desegregation on student functioning; specifically, to gather data, assess instruments used, and identify differences and similarities among students.
Subjects: Negro and white children in grade nine; random samples of tenth and eleventh grade children.
Methods: Subjects are given a variety of tests, the results of which are analyzed descriptively. Means, standard deviations, correlation coefficients, and reliability coefficients are calculated and analysis of variance used to categorize between samples. Evidences of present school functioning and changes resulting from desegregation are anticipated.
Duration: 1967-September 1968.
Investigator(s): Berj Harootunian, Ph.D., Syracuse University, Syracuse, N. Y. 13210; and Richard J. Morse, Ph.D., Chairman, Division of Social Sciences, Stillman College, Tuscaloosa, Ala. 35401.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

Specific Skills

23-PA-1 EFFECT OF INSTRUCTION ON DEVELOPMENT OF THE CONCEPT OF NUMBER

Purpose: To assess the knowledge of five- and six-year-old children regarding one-to-one correspondence and the invariance of number; to examine the effect of instruction on accelerating the acquisition of the concept of invariance of number.
Subjects: Children in the three kindergarten and two first grade classes of the Campus School.
Methods: Lorge-Thorndike Intelligence Test and a specially constructed Pretest on Invariance of Number developed from Piaget's clinical procedure were administered and tape recorded. Children were then classified by chronological age at Stage I, Stage II, or Stage III in their understanding of number, and assigned to experimental and control groups matched with respect to stage placement, chronological age, and sex. For a five-week period, experimental groups received instruction designed to develop

an understanding of equivalent sets and invariance of number while control groups followed the regular program of instruction in mathematics. Following the experimental period, the Posttest on Invariance of Number was administered and results analyzed to determine whether the instruction produced statistically significant gains.
Duration: 1966-1967.
Investigator(s): Dr. Angela Pace, Professor of Education, State University of New York, Cortland, N. Y. 13045.
Publications: *Journal of Educational Research*.

23-PA-2 MODERN MATHEMATICS AND INTELLIGENCE

Purpose: To establish the effect of modern mathematical learning on performance of children on intelligence tests.
Subjects: 1,000 pupils, age seven and older.
Methods: Pre- and posttest of Raven Progressive Matrices and Lorge-Thorndike Test were administered at the beginning and end of the school year.
Findings: Suggestions of a rise in I.Q. scores.
Duration: September 1967-January 1969.
Investigator(s): John D. Williams, B.Sc., Leader, Section for Mathematical and Conceptual Studies, and Kenneth Fogelman, B.A., National Foundation for Educational Research in England and Wales, 79 Wimpole St., London, W.1, England.
Cooperating group(s): Prof. Z. P. Dienes, Centre de Psychomathematique, Sherbrooke University, Sherbrooke, Quebec, Canada.
Publications: Section for Mathematical and Conceptual Studies Internal Bulletin No. 1, July 1967.

23-PB-1 THE USE OF AUDIOLINGUAL DRILLS TO FOSTER SYNTAX ACQUISITION IN THE WRITING OF FOURTH GRADE ELEMENTARY SCHOOL CHILDREN

Purpose: To investigate the value of audiolingual and written drills based on the audiolingual drills for writing improvement in fourth grade children.
Subjects: Fourth grade children.
Methods: Students were drilled orally on exercises involving sentence-combining transformations and then required to write selected examples of these sentences. They were asked to write free compositions periodically as a test of whether the methodology gave them command of an increasingly large inventory of structures.
Duration: 1966-1967.
Investigator(s): James W. Ney, Assistant Professor, English Language Center, Michigan State University, East Lansing 48823; Barbara D. Miller, Okemos Public Schools, Okemos, Mich. 48864.

23-PB-2 REPLICATION AND EXTENSION OF READING AND WRITING GRADIENTS: PRESCHOOL

Purpose: To replicate the work of Hildreth, Monroe, Gesell, Ilg, and Ames in the areas of preschool reading and writing behavior; to develop a normed test so these studies may be more precisely carried out; to extend the earlier studies to get norms by sex, race, and socioeconomic status.
Subjects: At least 50 boys and girls, ages three to five, of different races and socioeconomic status.

BEST COPY AVAILABLE

Methods: A criterion-reference test is administered and observational data collected.
Findings: Stimulated disadvantaged preschool children appear superior to advantaged traditional kindergarten children at least in (1) Handling Books behavior, (2) Picture Reading behavior, (3) Print Attention behavior, (4) Book-Related behavior, (5) Letter-and-Word-Reading behavior, and (6) Writing behavior.
Duration: January 1967-June 1970.
Investigator(s): Robert L. Aaron, D.Ed., Research Associate, Research and Development Center, University of Georgia, Athens, Ga. 30601.
Publications: In Proceedings, 13th Annual International Reading Association Convention, April 1968.

23-PB-3 THREE YEARS OF EXPERIMENTATION WITH THE INITIAL TEACHING ALPHABET

Purpose: To determine the effectiveness of the Initial Teaching Alphabet for providing beginning reading instruction to children from the West Genesee Central Schools.
Subjects: Representative sample of 556 children; control group of 1,418 traditionally taught children.
Methods: Initial Teaching Alphabet was used for beginning reading instruction to the experimental i.t.a. population. Control population received instruction from the traditional American basal reading series. Comparisons were made between the experimental and control populations on intelligence to determine the comparability of the groups. Following this, comparisons were made on criterion measures obtained from the Stanford Achievement Tests in grades one and two and Iowa Test of Basic Skills in grade three.
Findings: The experimental i.t.a. instructed children earned statistically significantly superior scores in the reading area when compared to the traditional orthography group at the end of grade one. I.t.a. transliterated forms of the test were administered to the i.t.a. instructed students. At the end of grade two when all testing was done on tests printed in the traditional orthography, the i.t.a. students earned significantly superior scores in spelling. The third grade testing revealed no significant differences between the experimental and control groups in reading.
Duration: Fall 1964-Summer 1970.
Investigator(s): Joan M. Ward, Senior Clinical Psychologist, Syracuse State School, Syracuse 13201; and Byron J. Ward, Ph.D., Director of Reading, West Genesee Central School District, 5203 W. Genesee St., Camillus, N. Y. 13031.
Publications: Paper submitted for presentation at the International Reading Association Meeting, April 1968.

23-PB-4 SCREENING FOR POTENTIAL READING DIFFICULTIES

Purpose: To devise a screening protocol based on the concept that brain functioning irregularities might result in difficulties in learning to read, and to administer it to children soon after entry into kindergarten to detect future reading disabilities.
Subjects: 300 kindergarten children enrolled in a Fresno elementary school in the fall of 1967 and 1968.
Methods: Teacher and parent questionnaires and individual psychological test data were collected on all kindergarten children and neurological examinations administered to a random sample. Students will be followed and group test data collected until the end of the second grade. Criterion

measure will be reading level at that time. Data will be analyzed to select those factors in kindergarten which would have predicted achievement at end of second grade.
Duration: May 1966-June 1969.
Investigator(s): Knox H. Finley, M.D., Director, Institute of Neurological Sciences, and Philip R. Calanchini, M.D., Associate Director, Neurological Education Division, Institute of Neurological Sciences, Pacific Medical Center, San Francisco 94115; M. Agnes McDermott, M.A., and Robert E. Doris, M.A., School Psychologists, and Margaret L. Thomas, M.A., Director of Guidance and Testing, Fresno City Unified School District, 2348 Mariposa St., Fresno, Calif. 93726.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Completed project report will be available in the fall of 1969.

23-PB-5 TUTORIAL INSTRUCTION FOR UNDERACHIEVING READERS AND WRITERS

Purpose: To improve the reading and writing performances of nonremedial students, typically receiving "C" grades and above, who are not achieving up to potential in these areas.
Subjects: 68 students each in grades 4, 7, and 10, selected on the basis of discrepancies between their obtained scores on the STEP Reading and Writing Tests and predictions of their potential on the California Test of Mental Maturity.
Methods: Students have been randomly assigned to three treatments: one-to-one tutoring (one student to one college student tutor); one-to-three tutoring (three students to one tutor); and control (remained in the regular classroom without being identified to the teacher). Groups have been compared on mean gains on the STEP Tests and teacher-developed tests for the first year, using analysis of covariance, and on relative frequency of reaching predicted potential for both years, using chi square.
Findings: Students under both tutorial conditions (one-to-one and one-to-three) have shown significant gains over control students, usually beyond the .01 and .001 levels of significance. Tutoring appears to be equally effective at all three grade levels. Neither tutorial condition (one-to-one or one-to-three) has shown an advantage over the other on the project measures.
Duration: August 1966-June 1969.
Investigator(s): Dee Nuhn, Director, Tutorial Project, Logan City and Cache School Districts, 101 W. Center; and James P. Shaver, Ed.D., Professor and Chairman, Bureau of Educational Research, Utah State University, Logan, Utah 84321.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Utah Educational Review 61:3, January-February 1968; Tutorial Instruction for Underachieving Readers and Writers. Logan, Utah: Logan City-Cache County School Districts, February 1968.

23-PB-6 LABORATORY CENTER FOR READING

Purpose: To explore the relationship between listening skills and reading disabilities; to establish a program which will enable children with reading disabilities to develop reading-thinking skills.
Subjects: Disabled readers of average or better potential, ages 8 to 10, attending Newport News Schools.

Methods: Small classes focus on individual instruction based on children's needs as determined from reading and psychological evaluations, teachers' evaluations, and social histories. Developmental patterns are analyzed using social histories and cumulative record data, and an analysis of WISC profiles is done on a selected sample of children. Parents are involved in program.
Duration: January 1966-August 1968.
Investigator(s): Molly Parrish, M.Ed., Coordinator of Reading, and Ruth Mulliken, Ph.D., Psychological Consultant, Laboratory Center for Reading, Newport News Public Schools, 225 River Rd., and Professor of Psychology, Christopher Newport College, Newport News, Va. 23601.
Publications: Plan to publish in professional journals.

23-PB-7 CRITICAL READING ABILITY OF ELEMENTARY SCHOOL CHILDREN

Purpose: To refine and verify a description of the desired behavior of a critical reader; to survey and test materials, techniques, and activities for use with elementary school children; to determine if critical reading can be taught in grades one through six while the usual instruction in basic skills is continued and interest in reading is maintained; to determine what pupil characteristics are related to critical reading.
Subjects: Students in 24 classrooms--four each at grade levels one through six; controls.
Methods: The tentative definition of critical reading was first verified by a panel of experts. A catalogue of successful techniques for teaching critical reading was organized, and tests and materials to be used with subjects in an experimental phase were developed. Pre- and posttests were administered, and statistical analysis was applied to results.
Duration: 1966-not reported.
Investigator(s): Willavene S. Wolf, Ph.D., Bureau of Educational Research and Services, College of Education, Ohio State University, Columbus, Ohio 43210.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

Special Education

23-QC-1 ESTABLISHMENT OF CORRECT USE OF PRONOUNS AND PREPOSITIONS IN SCHIZOPHRENIC AND RETARDED CHILDREN

Purpose: To investigate the conditions under which handicapped children can learn the correct use of and response to prepositions and pronouns.
Subjects: Schizophrenic and organically impaired children, who are both intellectually and linguistically retarded.
Methods: Emphasis centers on speech useful in the child's daily functioning. A reinforcement theory paradigm and an experimental-laboratory design are used; the material employed consists of objects and articles from the child's environment. Intelligence-predictor tests are administered. Data analyses include a separate treatment of the results of training, extinction, and retraining series, analyses of covariance, and followup comparisons.
Duration: Not reported-September 1969.
Investigator(s): O. Ivar Lovaas, Ph.D., Professor of Psychology, University of California, Los Angeles, Calif. 90024.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

23-QE-1 THE SAN ANTONIO LANGUAGE RESEARCH PROJECT FOR DISADVANTAGED SPANISH-SPEAKING CHILDREN

Purpose: To improve the self-image of disadvantaged Spanish-speaking children by providing an experiential background rich in conceptual understandings, and by establishing command of basic linguistic forms and increasing proficiency in the use of oral English to be phased into reading and writing.
Subjects: 2,450 first, second, and third grade pupils in 81 classrooms; control group of 24 classes ranging from very low to high socioeconomic levels and including variations of Mexican-American, Negro, and Anglo ethnic groups.
Methods: Intensive daily instruction in oral-aural English and oral-aural Spanish; instruction in American Association for the Advancement of Science science content not using intensive language techniques (nonoral-aural). Continuous and intensive teacher education is provided through inservice programs.
Duration: September 1964-June 1970.
Investigator(s): Thomas D. Horn, Ph.D., Professor and Chairman, and Richard D. Arnold, Ph.D., Assistant Professor, Department of Curriculum and Instruction, College of Education, University of Texas, Austin 78712; Elizabeth H. Ott, Ph.D., Southwest Education Development Laboratory, Inc., Austin 78701; and Raymond Arnold, M.A., Assistant Superintendent, San Antonio Independent School District, San Antonio, Tex.
Cooperating group(s): Texas Education Agency.
Publications: *A Study of Levels of Fluency and Proficiency in Oral English of Spanish-speaking School Beginners*, Elizabeth H. Ott. Austin, Tex.: University of Texas, 1967; *Harvard Educational Review* 36:42-59, Winter 1966; *The Reading Teacher* 20:38-42, October 1966; additional materials available from Dr. Richard D. Arnold.

23-QE-2 INTENSIVE READING AND INSTRUCTIONAL TEAMS (IRIT)

Purpose: To develop an intensified program of team reading instruction, and to explore its effects on selected groups of disadvantaged inner-city youngsters.
Subjects: 469 fourth, fifth, and sixth grade children selected on the basis of flexible criteria which included measured reading achievement one to three years below grade level, an ability to work successfully in a group program as judged by the teacher, and operational fluency in the English language.
Methods: Students were instructed in cycles ranging from 9 to 10 weeks in length by a team of two reading teachers and a reading specialist. Daily instruction stressed vocabulary and comprehension development, phonics to include instruction in word attack skills, and individualized reading, with students moving from teacher to teacher on an hourly basis. Instructional techniques involved a departmentalized structure, the employment of each team member in only one of the three instructional areas, extensive use of motivational and multimedia techniques, new reading materials, and the use of the pupil-teacher conference as both a motivational and an assessment technique.
Findings: Results from the pre- and posttesting of 341 children using the California Reading Achievement Test showed that significant mean gains were made by pupils in the areas of vocabulary, comprehension, and total reading achievement, and that the 1966-67 group gains generally equalled or surpassed those reported for comparable cycles during the previous school year. Data from the Lorge-Thorndike Intelligence Test given to 71 children indicated no significant gains following 10 weeks of intensive instruction. Questionnaires and evaluation forms found that there was an

acceptance of the program by teachers, parents, and pupils coupled with the expressed feeling that the program was beneficial in helping individual children to read. A followup study revealed that approximately 66 percent of the tested group continued to make significant gains in comprehension and total reading, while 38 percent made gains in vocabulary only. Of the remaining children tested, there was no significant change in achievement scores since the end of the IRIT cycle. Consequently, it can be assumed that the gains obtained are still being maintained though not necessarily improved upon.

Duration: September 1965-indefinite.

Investigator(s): Robert J. Nearine, M.A., Coordinator of Evaluation, Hartford Public Schools, 249 High St., Hartford, Conn. 06103.

Cooperating group(s): Connecticut Department of Education.

Publications: Mimeographed report available from Mr. Nearine.

23-QE-3 LEARNING LABORATORY TO TEACH BASIC SKILLS IN A CULTURALLY DEPRIVED AREA

Purpose: To establish a learning laboratory which will provide basic education, individually and in groups, for culturally disadvantaged students preparatory to entrance into vocational training or employment, and inservice training for teachers working with these students.

Subjects: 270 students who need to improve basic skills to qualify for entrance into vocational programs or who are retarded two or more years in reading and arithmetic; control groups.

Methods: The laboratory program is staffed by a coordinator and trained specialists in the language arts, arithmetic, and guidance. It is implemented for a three-year period in a high school setting as an adjunct to regular academic programs offered in grades 10, 11, and 12. Overall program is assessed in terms of changes in basic skills competence, vocational aptitude, vocational aspirations, and employability of students in the program, as compared with control groups.

Duration: May 1965-August 1968.

Investigator(s): Nicholas H. Borota, Principal, Booker T. Washington Junior High School, 1200 N.W. Sixth Ave., Miami, Fla. 33136.

Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

Publications: Final report planned for July 1968.

23-QE-4 YPSILANTI CARNEGIE INFANT EDUCATION PROJECT

Purpose: To develop the potential of the home for the adequate education of the young child through a home teaching program.

Subjects: Disadvantaged families with children three months and older.

Methods: Trained teachers make weekly visit to the homes and focus on assisting the mother to aid the child through language patterns, child management techniques, and teaching styles. Some direct teaching of the child is done to assist the mother in understanding the process.

Duration: January 1968-June 1970.

Investigator(s): David P. Weikart, Ph.D., Director, Special Services, Ypsilanti Public Schools, 300 W. Forest, Ypsilanti, Mich. 48197.

Cooperating group(s): Carnegie Corporation.

Publications: Progress report planned for June 1969; final report, June 1970.

23-QE-5 LONGITUDINAL COMPARISON OF THE PSYCHOLINGUISTIC FUNCTIONING OF "EDUCATIONALLY DEPRIVED" AND "EDUCATIONALLY ADVANTAGED" CHILDREN

Purpose: To compare the changes in psycholinguistic functioning of disadvantaged children after one year in an integrated school; to determine whether measurable changes in the psycholinguistic ability of preschool disadvantaged children can be produced through a language-oriented preschool curriculum.
Subjects: Children who had attended a segregated school and were being bussed to an integrated public school; 45 disadvantaged preschool children in Ann Arbor and Inkster, Mich., and control group of 30 children in Inkster.
Methods: Children in the integrated school were pre- and posttested, and data are being analyzed. Disadvantaged preschool children were tested at the beginning of the program. During the year, investigators and teachers developed techniques for improving the language habits of these children. Children were tested at the end of the program to determine whether measurable changes had been produced. Control group was pre- and post-tested without the introduction of the special language program during their preschool experience. The Illinois Test of Psycholinguistic Ability and supplementary measures will be used to assess changes in the preschool children.
Duration: Not reported.
Investigator(s): Loren S. Barritt, M.S., Melvyn I. Semmel, Ph.D., and Paul Weener, Center for Research on Language and Language Behavior, University of Michigan, Ann Arbor, Mich. 48104.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: The Comparison of the Psycholinguistic Function of Educationally Advantaged and Educationally Deprived Children, Progress Report II. (Analysis of the pretest data.)

23-QE-6 THE EFFECT OF PRESCHOOL GROUP EXPERIENCE ON VARIOUS LANGUAGE AND SOCIAL SKILLS IN DISADVANTAGED CHILDREN

Subjects: 54 disadvantaged four-year-old children from low income families in two adjacent census tracts in Fremont, Calif., divided into experimental, active control, and passive control groups for each census area.
Methods: Experimental groups participated in a preschool program concerned with specific behavioral goals in language and social development. Teaching techniques emphasized positive reinforcement of desired behaviors, extinction of undesirable behaviors, and verbal modeling. Parent-teacher conferences were conducted as one of the parent involvement activities. Subjects in the active control groups attended a similar experimental session during the last five days of the six-month program; the passive control groups received no preschool experience. Illinois Test of Psycholinguistic Abilities, Peabody Picture Vocabulary Test, and several language subtests were administered. Statistical analysis employed a three by two analysis of variance procedure with sex and treatment as the variables.
Duration: September 1966-June 1967.
Investigator(s): Dr. Barbara Vance, Child Development Department, Brigham Young University, Provo, Utah 84601.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

23-QE-7 AN EXPERIMENTAL PRESCHOOL EDUCATION PROGRAM FOR SOCIALLY DISADVANTAGED FAMILIES

Purpose: To test hypothesis that, in a preschool program with an enriched curriculum for socially disadvantaged children, those children whose parents are involved in weekly participation-education activities will show significantly more language and intellectual development than children whose parents are involved minimally.
Subjects: 52 children, starting at age three, assigned on a stratified random basis to two groups; parent participation groups.
Methods: Group I involves intensive parent participation, and Group II, minimal parent participation. Program covers two school years with follow-up tests for subsequent years. Pre- and postmeasures consist primarily of the Peabody Picture Vocabulary Test and the Stanford-Binet (Form L-M). Siblings are tested to compare diffusion effects, and parent attitude measures will compare possible changes.
Duration: October 1966-September 1968.
Investigator(s): Hazel Leler (Ph.D. Candidate), Research Associate, Mental Research Institute, 555 Middlefield Rd., Palo Alto, Calif. 94301. (Reported by Virginia M. Hill, Assistant Administrator, Mental Research Institute.)
Cooperating group(s): Luke B. Hancock Foundation; California Department of Compensatory Education.
Publications: Publications planned at completion of study.

23-QE-8 DETERMINING THE COMPATIBILITY OF STUDENT TEACHERS FOR CULTURALLY DEPRIVED AREAS BY MEANS OF A CULTURAL ATTITUDE INVENTORY

Purpose: To determine whether student teachers who will be successful with culturally disadvantaged children can be selected prior to student teaching by their responses to a Cultural Attitude Inventory.
Subjects: Elementary education students from Pennsylvania State University completing their student teaching with disadvantaged elementary school children in three different cities.
Methods: A Cultural Attitude Inventory was developed and administered to the students, in addition to the Minnesota Teacher Attitude Inventory and Warner's Socioeconomic Scale, prior to their student teaching. On the basis of the scores obtained from the Inventory, those students who would apparently be most effective and those least effective with the disadvantaged were selected and placed for student teaching in schools in disadvantaged areas. The student teachers were observed and rated on an observation record by a student teaching supervisor, cooperating teacher, and the investigator, to determine their effectiveness.
Findings: The Cultural Attitude Inventory was found to be effective and more discriminating than the others in selecting those student teachers who could work successfully with disadvantaged children.
Duration: September 1965-completed.
Investigator(s): Dorothy J. Skeel, D.Ed., Assistant Professor, Indiana University, Bloomington, Ind. 45405. On leave for 1968-69, Tri-University Project, University of Washington, Seattle, Wash. 98105.
Publications: The Cultural Attitude Inventory has been approved for use with Government-sponsored projects and is currently in use at the MCREL Laboratory. In addition, Southern Illinois University at Edwardsville (Psychology Dept.) is working on a verification scale.

23-QE-9 THE EFFECTS OF TEACHER ATTITUDE AND CURRICULUM STRUCTURE ON PRESCHOOL DISADVANTAGED CHILDREN: AN EXPERIMENTAL STUDY OF TWENTY-FOUR CLASSES

Purpose: To evaluate two preschool programs for disadvantaged children--a language ability focused program (Bereiter-Engelmann Method), and a more traditional developmentally structured program emphasizing adjustment, motivation, and general school readiness; to assess the effects of teacher attitudes toward curriculum structure on effects of preschool programs; to describe a baseline for followup of long-term effects; to investigate teacher and parental attitudes toward disadvantaged children as affecting student outcomes; to describe such student characteristics as health, ability level, and family support.

Subjects: One group of 360 and another of 180 preschool disadvantaged children randomly selected from approximately 750 eligible applicants.

Methods: First group assigned to 24 experimental classes in 10 centers throughout a midwestern city. Second group of 180 assigned to classes on basis of attitude toward curriculum structure. Dependent variables are specific and general language abilities and social adjustment behaviors. Analysis includes a two by two factorial design with six replications employing analysis of variance and multiple regression procedures.

Duration: August 1967-August 1969.

Investigator(s): Edsel L. Erickson, Ed.D., Center for Sociological Research, Western Michigan University, Kalamazoo 49001; Joseph McMillan, Supervisor, Inner City Schools, and Jane A. Bonnell, Ph.D., Director of Evaluation Services, Grand Rapids Public Schools, Grand Rapids, Mich.

Cooperating group(s): U. S. Office of Economic Opportunity.

23-QE-10 TEEN TUTORIAL PROGRAM TO MEET THE DEVELOPMENTAL NEEDS OF DISADVANTAGED CHILDREN IN THIS AND FUTURE GENERATIONS

Purpose: To educate young teenagers in human development and family living so that they will be better able to meet their developmental needs in the years immediately ahead, and to adequately meet the needs of their children later in life when they become parents.

Subjects: 20 boys and 20 girls enrolled at Finland Junior High School, and 48 children in kindergarten at Finland Elementary School; control groups.

Methods: Forty seventh grade boys and girls meet daily in groups of 20 for a course in personal and social development integrated with guided observation and well-planned and closely supervised tutorial experiences with kindergarten children. Both standardized tests and specially developed instruments are administered, analyzed, and interpreted.

Findings: Indications are that many seventh graders have gained more favorable impressions of themselves and have shown growth in recognition of individual differences in children, improvement in social relationships, and development of better means of coping with stress. Kindergarteners have benefited from additional help.

Duration: Summer 1966-August 1969.

Investigator(s): Jay Lowe, Ph.D., Research Associate, Department of Sociology, Ohio State University, Columbus, Ohio 43210. (Reported by Gene Telego, Supervisor, Teen Tutorial Project, 1825 Finland Ave., Columbus 43223.)

Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

Publications: Evaluation report on first phase of Teen Tutorial Program available August 1968.

23-QE-11 LONG-RANGE EFFECTS OF A LANGUAGE STIMULATION PROGRAM UPON NEGRO EDUCATIONALLY DISADVANTAGED FIRST GRADE CHILDREN

Purpose: To conduct a followup evaluation of an experimental program's effect on the intelligence, linguistic abilities, and reading ability of disadvantaged children.

Subjects: 32 educationally disadvantaged first grade Negro children who received the experimental treatment lessons from the Peabody Language Development Kit.

Methods: A battery of tests was readministered to the children and a comparison made between immediate posttreatment scores and a delayed posttest administered approximately one year following the end of the program.

Duration: October 1966-April 1967.

Investigator(s): Dr. John L. Carter, University of Houston, Houston, Tex. 77004.

Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

23-QE-12 INCREASING CHILDREN'S ACHIEVEMENT-ORIENTED BEHAVIOR IN NURSERY SCHOOL

Purpose: To determine whether the volume of achievement-oriented behavior demonstrated by urban nursery school children can be heightened through short-term training.

Subjects: 13 matched pairs of Head Start children, ages four and five; their parents.

Methods: During the second and third weeks of March, the mothers met for nine hours in three sessions during which (a) the purposes of the research project were given, (b) the findings of Rosen regarding the childtraining behavior of mothers of sons with high achievement motive were explained in lay terms, and McClelland's film "Need for Achievement" was shown, and (c) the techniques of helping a child carry out achievement-oriented behavior were demonstrated and practiced. From the last week of March until the third week of June, the achievement training was administered to the children in the experimental group. Each school day they came to a room in the Center prepared especially for the training, while their classmates were in recess from the regular Head Start activities. Thirty minutes each day, for 51 days, an experienced nursery school teacher and her graduate student assistant, both trained in the theory and practice of assisting children to accomplish achievement-oriented behavior, administered four types of treatment: (a) the two women acted as mothers who help children set achievement goals of moderate risk, (b) they used language helpful to achievement in their conversations with the children, (c) they conveyed feedback from task efforts to the children, and (d) they gave reinforcement for success in goal achievement and arranged group support among the children. Further research with similar short-term input is planned on larger groups of children who demonstrate no more than a moderate level of achievement-oriented behavior at the outset, using a more sensitive instrument refined during the present study.

Findings: Use of two measures of achievement-oriented behavior showed statistically insignificant changes by the experimental group when compared with a control group of thirteen closely matched Head Start children.

Duration: February-June 1968.

Investigator(s): Eugene H. Stivers, Ph.D., Associate Professor and Chairman, and Surang Kowatrakul, Ph.D., Associate Professor, Department of Educational Psychology, Temple University, Philadelphia, Pa. 19122.

Cooperating group(s): Temple University Center for Head Start Research and Evaluation; Philadelphia Head Start.

Publications: Copy of report available from Dr. Stivers.

23-QE-13 YPSILANTI PRESCHOOL CURRICULUM DEMONSTRATION PROJECT

Purpose: To compare impact of three basic preschool curriculum styles in a regular public school setting.
Subjects: Disadvantaged and functionally retarded children, ages three to five, randomly assigned to one of three groups.
Methods: The three styles employed are the unit-based traditional nursery program, the cognitively oriented curriculum developed during the last five years of the Ypsilanti (Perry) Preschool Project, and the Language Training program developed by Bereiter-Engelmann.
Findings: The results parallel the expectation of diverse studies. The initial I.Q. gain is directly related to the degree of teacher intensity and language use.
Duration: September 1967-February 1971.
Investigator(s): David P. Weikart, Ph.D., Director, Special Services, Ypsilanti Public Schools, 300 W. Forest, Ypsilanti, Mich. 48197.
Publications: Initial Results of a Comparative Preschool Curriculum Project, D. P. Weikart and R. Weigerink; additional materials such as video tapes, 16mm. films, and reports will be produced during the course of the project; final report.

23-QE-14 REALIZING THE POTENTIAL OF UNDERPRIVILEGED YOUTH

Purpose: To survey the social sources of achievement of low income youth; to study the effects of different kinds of client participation in educational programs upon program results.
Subjects: 4,077 secondary school students and members of 1,600 households in the community; seventh grade students and preschool children, age four, and their parents.
Methods: A sample survey of the secondary school students provided information on school, family, and neighborhood experiences, educational and occupational values and aspirations, and various psychological dimensions. Survey of households was concerned with perceptions of and experiences with public institutions, family life, occupational experiences, race relations, and other topics relevant to the socialization of youth. Field study involved the operation of a study hall for seventh grade students and two sessions of parent-participant preschool programs for four-year-olds. Measurements were made of the skills and behavior of the students, and of the parents' socialization practices and knowledge of child development. Interviews, structured observations, and process reports were used to gather information on client participation in the program and the effects of varying institutional aegis upon program outcomes.
Duration: April 1967-March 1968.
Investigator(s): Alan B. Wilson, Associate Professor of Education, University of California (present address: Blythe Cottage, Piddinghoe, Newhaven, Sussex, England), Charles Y. Glock, Ph.D., Professor of Sociology, and Ralph Kramer, Ph.D., Assistant Professor of Social Welfare, University of California, Berkeley, Calif. 94720.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Final report in preparation.

23-QG-1 ORGANIZATIONAL PROBLEMS IN ENROLLING HARD-CORE YOUTH AND IN CREATING ATTITUDE CHANGES IN THE HOUSTON NEIGHBORHOOD YOUTH CORPS PROJECTS

Purpose: To examine the impact of Neighborhood Youth Corps operating procedures on enrollees; specifically, to identify problems of enrollee

recruitment; to determine the effectiveness of the NYC program in developing motivation and positive attitudes toward learning among enrollees; to assess the relationship between NYC wage incentives and enrollee recruitment and morale. In addition, the project will study the internal organizational problems of sponsoring agencies and problems affecting the relationship between sponsoring agencies and institutions accepting NYC enrollees.
Subjects: Enrollees in two out-of-school and three in-school NYC projects in the Houston metropolitan area.
Methods: Data are collected through observation of the social interaction and behavior of NYC staff, enrollees, and job supervisors, with emphasis on one in-school and one out-of-school project; informal interviews with staff and enrollees; formal questionnaire interviews with a sample of enrollees from each project to determine whether their work experience has brought about attitude change. Additional data are collected from Houston NYC agency files and from other studies on NYC operations.
Duration: Not reported-September 1968.
Investigator(s): Edwin S. Harwood, Ph.D., Department of Sociology and Anthropology, Rice University, Houston, Tex. 77001.
Cooperating group(s): Manpower Administration, U. S. Department of Labor.

23-QG-2 SPECIAL EDUCATION VOCATIONAL REHABILITATION PROJECT (SEVR)

Purpose: To discover and demonstrate ways in which the employability characteristics of a population of urban retarded and disadvantaged youth could be upgraded; to evaluate the relative effectiveness of close interagency functioning of Public School Special Education and the State Division of Vocational Rehabilitation as the two agencies which provide intensive supportive services to these youth.
Subjects: 15-year-old mildly retarded disadvantaged Negro and white males and females enrolled in Special Education programs for the educable mentally retarded in Detroit inner-city schools. Subjects were divided into experimental and control groups, each comprising seven Negro males, four white males, three Negro females, and two white females.
Methods: Experimental and control groups were selected at random every four months for entry into the program. Each youth was assigned to a rehabilitation counselor who coordinated and planned for appropriate services to both client and family while client participated in three major program phases over a 16-month period. The first phase consisted of eight months of instruction in personal, social, and academic skills, and practical training in a simulated industrial setting where students were paid on a piecework basis for performing different kinds of work. During this phase the students received group counseling and observed a variety of workers. Phase II consisted of concentrated prevocational appraisals by way of work sample, testing instrument, and an initial community work experience which was nonsuccess oriented. Client reactions to these first community work experiences were carefully evaluated by employers, staff members, and clients themselves. The final phase constituted On-The-Job Training (OJT) for 13 to 20 weeks, followed by placement in full-time employment. Both placement agent and rehabilitation counselor continued to give support and guidance for 30 to 90 days following placement. Experimental and control subjects were interviewed at ages 17 and 18 to determine subjects' early past-project experiences as well as inproject changes.
Findings: Questionnaires completed by employers and parents and test and scaled evaluations of the clients indicate effectiveness of the program.
Duration: February 1962-January 1967.
Investigator(s): Denny Stavros, M.A. (Ph.D. Candidate), Research Coordinator, Jamesetta Colbert and Ruth Copeland, Teachers, Detroit

Public Schools; Allan Kobernick, B.S., Wayne State University, Detroit, Mich., and others. (Reported by Eugene Straley, Principal, Detroit Special Education Vocational Rehabilitation Project, 2918 Rivard St., Detroit, Mich. 48207.)
Cooperating group(s): Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.
Publications: Final report, June 1967.

23-QG-3 IMPROVED OPPORTUNITIES FOR DISADVANTAGED YOUTH THROUGH VOCATIONALLY ORIENTED EDUCATION

Purpose: To generate an effective vocationally oriented educational program that will enable economically and socially handicapped rural youth to prepare themselves for gainful employment and to utilize their developing vocational competence to improve the economic and social situation in their depressed rural communities.
Subjects: 116 rural families, chosen at random from 10 Illinois communities, having 524 children living at home, living on an acreage of land, and having incomes of less than $3,000.
Methods: Initial phases involve a study in depth of a typical depressed rural community and its inhabitants to identify the anthropological, economic, psychological, and sociological conditions and trends that typify the area. Following this, a model preparatory and supplemental vocational program will first be applied in a single community and then in five communities and evaluated in terms of processes used and results obtained.
Duration: July 1965-June 1970.
Investigator(s): Lloyd J. Phipps, Ed.D., Professor and Chairman, Division of Agricultural Education, and Gerald R. Fuller, Ed.D., Assistant Professor, Department of Vocational and Technical Education, University of Illinois, Urbana, Ill. 61801.
Cooperating group(s): Center for Instructional Research and Curriculum Evaluation (CIRCLE), University of Illinois; Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Reports planned at conclusion of project.

23-QH-1 A PILOT APPROACH TO THE EDUCATION OF FIRST GRADE PUBLIC SCHOOL CHILDREN WITH PROBLEMS IN BODILY SCHEMA, PERCEPTUAL-MOTOR AND/OR LANGUAGE DEVELOPMENT

Purpose: To investigate the effects of class grouping, selected curriculum techniques, and training in bodily and spatial schema.
Subjects: 50 first grade children.
Methods: Subjects were placed in three self-contained classrooms: an experimental class with 12 children identified as having problems with bodily and spatial schema was given special techniques and training; a control class of 6 children with problems and 12 without was given a traditional curriculum; and an experimental class of 24 children without the problems was given a traditional curriculum. Experimental and control classes were closely matched. Modifications of techniques developed in previous clinic research were adopted for use in a public school. Standard evaluative measures were taken in the fall and spring, and growth patterns in each class studied.
Duration: February 1966-not reported.
Investigator(s): Selma G. Sapir, M.A., Psychologist, Teachers College, Columbia University, New York, N. Y. 10027.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

23-QH-2 VISUAL LANGUAGE LEARNING PROCESSES IN DEAF CHILDREN

Purpose: To enhance the reading process in the deaf child; to demonstrate the value of simultaneous presentation of the speech-read and printed work form in the reading process; and to demonstrate the value of individual attention and more creative use of time by teachers permitted by use of teaching machines and films.
Subjects: 60 deaf children; control group.
Methods: A film, simultaneously presenting the speech-read and printed work form, is shown to subjects in a series of 10 presentations; a post-test will assess learning. Programmed learning and an automated teaching machine are used to determine the efficiency of these media. Findings from experimental and control groups are compared to establish the efficacy of the approach.
Duration: June 1966-1968.
Investigator(s): Helmer R. Myklebust, Ed.D., Director, Institute of Language Disorders, Northwestern University, Evanston, Ill. 60201.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.

23-QH-3 COOPERATIVE PROJECT FOR PREGNANT SCHOOL GIRLS

Purpose: To provide continuing education and health and social services for pregnant girls who leave school because of pregnancy and continue to live in the community; to study the psychosocial problems of adolescent pregnant girls, their family situations and plans for the baby, and their response to continuing education and instruction in health and infant care, and group counseling.
Subjects: Married and unmarried pregnant school girls in Durham, N. C.
Methods: Initially, 16 girls were selected to take part in a program planned and conducted by the Durham Community Planning Council. In the selection process, semistructured interviews were conducted with 70 girls, their parents, and putative fathers; conferences were held with schools and referring agencies; minutes of staff conferences on individual girls and on the group were taken, and medical and academic records were gathered. In next phase, program of education and health and social services is to be enlarged.
Duration: July 1967-July 1971.
Investigator(s): Maurine LaBarre, M.S.W., Social Work Research Consultant, Education Improvement Program of Durham; and Assistant Professor of Psychiatric Social Work, Division of Child Psychiatry, Duke University Medical Center, Durham, N. C. 27706.
Cooperating group(s): Office of Education, U. S. Department of Health, Education, and Welfare.
Publications: Ongoing evaluations and reports will be prepared and available as the project proceeds.

SOCIAL SERVICES

23-RA-1 NATIONWIDE EVALUATION OF CHILD CARE SERVICES

Purpose: Based on the assumption that the provision of child care services for children from economically deprived backgrounds will undergo considerable expansion in the near future as a result of current political realities and professional trends, this study is intended to: monitor the response of public and private social service systems throughout the United States to the child care provisions in the recent amendments to the Social Security Act; study the short- and long-term effects and consequences of child care services actually delivered in selected states and communities on children and families and on the social well-being and economic development of communities; design systems for routine monitoring of the operations and performance of child care services in order to provide feedback geared to in-process quality control of child care services, ascertain and evaluate relevant effects and consequences of services, and conduct cost-benefit analyses of these services.
Methods: Contacts with state welfare and other relevant governmental systems, regional offices of the Department of Health, Education, and Welfare, and private organizations interested in child care services on state, regional, and national levels will be used to monitor responses to the Social Security amendments and to study the effects and consequences of child care services. Monitoring system is planned on a nationwide level, while the effects and consequences of day care services will be studied in sample communities. Systematic topical interviews with samples of consumers, potential consumers, and providers of child care services and with individuals representing various groups having an interest in these services will provide information on overt and covert philosophies, objectives and expectations, and proposed and actually used means for achieving these objectives. Development of research tools for monitoring, quality control, and evaluation models will be based on the nationwide monitoring operation and the evaluative studies in sample communities.
Duration: 1967-1972.
Investigator(s): David G. Gil, D.S.W., Associate Professor, and Herbert J. Hoffman, Ph.D., Assistant Professor, Florence Heller Graduate School for Advanced Studies in Social Welfare, Brandeis University, Waltham, Mass. 02134.
Cooperating group(s): Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.

23-RB-1 CLIENT ORIENTATIONS AND ATTITUDES: AN EXPLORATION INTO COORDINATED SERVICE PROGRAMS

Purpose: To explore the possibility of designing service programs which will more closely approximate clients' preservice orientations and consequently yield better results.
Subjects: 46 boys selected from a cluster of boys of similar orientation and background.
Methods: Boys are cross-classified through various scaling devices and measurement techniques. Various measures of association are used for ordinal level scales, and selected tests of significance are administered.

Findings: Those clients who conceived of the services as being commensurate with their orientation before services significantly reduced their acting out behavior in school and in the community, while incongruent orientations and service clients increased such behavior.
Duration: Spring-August 1967.
Investigator(s): Clyde W. Franklin, Jr., M.A. (Ph.D. Candidate, University of Washington), Research Assistant, Atlantic Street Center, 2103 S. Atlantic St., Seattle, Wash. 98144.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Will probably publish; report available from Atlantic Street Center.

23-RB-2 USE OF WELFARE AIDES IN A CHILD WELFARE AGENCY

Purpose: To assess the effects of assignment of welfare aides to different levels of responsibility on the quantity and quality of agency service to individual cases; to permit conclusions to be drawn about the upper limit of responsibility of welfare aides.
Subjects: 10 - 12 aides employed at the Children's Aid Society, Vancouver, B. C.
Methods: A large number of cases of various types are assigned, with welfare aides assuming different levels of responsibility on different cases. Measures of service quality, task performance, and client outcomes will be devised and applied using different experimental groups.
Duration: May 1967-September 1969.
Investigator(s): John A. Crane, Ph.D., Associate Professor, School of Social Work, University of British Columbia, and Louis E. Reimer, M.S.W., Research Assistant, Children's Aid Society, Vancouver, British Columbia, Canada.
Cooperating group(s): Welfare Grants Division, Department of National Health and Welfare, Canada.

23-RB-3 MAINTENANCE AND INNOVATION IN PRIVATE YOUTH WELFARE AGENCIES

Purpose: To assess the degree to which differences in innovation among private youth welfare agencies may be accounted for by differences in their organization structure; to determine the effects of mergers of welfare agencies, particularly on their clientele.
Subjects: 12 agency executives in Chicago, each one of whom represents a large merged complex of agencies.
Methods: During a pilot study, agency executives were interviewed, and historical records and budgets of the agencies and census records of agency areas were surveyed in order to answer the following questions: What are some of the socioeconomic conditions which facilitate mergers? What are some of the differential consequences of agency mergers on the agencies themselves, their clientele, and on the institutional organization of welfare services in the communities of which they are a part?
Findings: Welfare agencies are among the last institutions in our society to be affected by bureaucratic processes, one consequence of which is merger activity. Other pilot findings will be used to plan a more systematic investigation.
Duration: October 1965-continuing.
Investigator(s): Lawrence H. Streicher, Ph.D., Senior Research Associate, and Emil Peluso, B.S., Research Associate, Institute for Juvenile Research, 232 E. Ohio St., Chicago, Ill. 60611.
Publications: To be published in professional journals.

23-RB-4 TRAINING AND RESEARCH FACILITY IN CHILD WELFARE PRACTICE

Purpose: To test and initiate new approaches in program planning and services for the community, with particular emphasis on the welfare of children and experimentation in new methods of social work education towards more effective preparation for practice.
Methods: Under the professional direction of Case Western Reserve University's Field Work Department, a training and research facility has been established at a settlement house in a low income area of Cleveland. Educational approaches being tested include new patterns of preparation for practice across traditional social work method lines. Directions in service include those initiated through the facility itself and those brought to the community being served via other agencies, through the initiative of the facility. Program and educational directions will be systematically assessed.
Duration: July 1966-continuing.
Investigator(s): John B. Turner, D.S.W., Associate Dean and Professor, Case Western Reserve University School of Applied Social Sciences, Cleveland, Ohio 44106; and Ivor Kraft, Ph.D., Sacramento State College School of Social Work, Sacramento, Calif. 95819.
Cooperating group(s): Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.

23-RD-1 POSTPLACEMENT FUNCTIONING IN ADOPTIVE FAMILIES: A FOLLOWUP STUDY OF ADOPTIONS AT THE CHILDREN'S AID SOCIETY OF PENNSYLVANIA

Purpose: To study the development of children adopted through Children's Aid Society of Pennsylvania as compared with natural children; to relate variables in the adoptive family and early living experience of the child to his present functioning.
Subjects: 100 adopted children, and 100 natural children selected from a public school system, all ages 10 to 15.
Methods: Longitudinal study will focus on the child's intelligence, school achievement, and personality functioning, fantasy material concerning adoption, and teacher's rating of the child's adjustment. Findings on these variables will be related to ratings made on the adoptive family in an earlier phase of the study. (See Research Relating to Children, Bull. No. 18-Y-3.)
Duration: August 1966-June 1968.
Investigator(s): Janet L. Hoopes, Ph.D., Chief Psychologist, Children's Aid Society of Pennsylvania, 311 S. Juniper St., Philadelphia, Pa. 19107. (Reported by Elizabeth A. Lawder, D.S.W., Executive Director, Children's Aid Society of Pennsylvania.)
Cooperating group(s): Graduate Department of Social Work and Social Research, Bryn Mawr College, Bryn Mawr, Pa. 19010.

23-RE-1 CHILD WELFARE RESEARCH PROGRAM

Purpose: To conduct a longitudinal study of foster care, including entry, child assessment, family, and agency studies.
Subjects: 624 children who entered foster care in 1966 and were cared for by New York City child welfare agencies; their families.
Methods: Entry study focuses upon factors determining how and where the children are routed in the child care system. Child assessment study involves psychological testing of the children, ratings of their behavioral characteristics, and profiles of their adjustment in various life space

BEST COPY AVAILABLE

areas. Family study consists of field interviews with mothers and fathers of the children concerning circumstances leading to placement, parental feelings and attitudes, family functioning, and socioeconomic factors. Agency study involves telephone research interviews with caseworkers in agencies planning and caring for the children. Children who have been discharged to their own homes will continue to be studied, along with those remaining in care.
Duration: 1965-1970.
Investigator(s): David Fanshel, D.S.W., Professor, Columbia University School of Social Work, New York, N. Y. 10028.
Cooperating group(s): Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.

23-RF-1 A WORK-RELATED CHILD DEVELOPMENT CENTER

Purpose: To meet the need and create a demand for good care for children of working mothers; to offer employment as an escape from poverty; to demonstrate the feasibility of a partnership between government, industry, parents, and educational institutions to meet a need which none of them could fully meet alone.
Methods: An all-day child development center was established in an industrial setting for children whose parents work nearby. The Center provides a comprehensive program for children and employs their parents. The effects of such a service on the parent-employees will be evaluated, and costs will be weighed against the measurable advantages to industry in cosponsoring such a program.
Duration: 1967-1970.
Investigator(s): F. Kate Bulls, M.Ed., Executive Director, Florence M. Bailey, B.S., Head Teacher, and George Gulick, Teacher, KLH Child Development Center, Inc., 30 Cross St., Cambridge, Mass. 02139.
Cooperating group(s): Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.

23-RF-2 GROUP CARE OF INFANTS--A DEMONSTRATION PROJECT

Purpose: To demonstrate the dimensions of an optimum environment for daytime care of infants in a nursery center; to study the effect of group care on growth and development of infants; to describe a pilot course of training provided to the staff of the center, emphasizing the identification of tasks which can be performed by nonprofessional staff and the development of techniques for assessing the results of training; to document cost and related factors in the operation of adequate facilities for group daytime care of infants and toddlers.
Subjects: Infants and toddlers, ages 3 to 23 months; control group of similar children not enrolled at nursery center.
Methods: Daytime care includes health care and protection, satisfaction of emotional needs, encouragement of social interests, and an appropriately stimulating environment for intellectual growth and learning. Growth and development of infants enrolled in nursery center will be compared with that of control group being cared for in their homes by their own mothers in order to assess effects of group care.
Duration: 1965-1970.
Investigator(s): Mary E. Keister, Ph.D., Research Associate, Institute for Child and Family Development, and Frances Y. Dunham, Ph.D., Assistant Professor, Department of Psychology, University of North Carolina, Greensboro, N. C. 27412.
Cooperating group(s): Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.

23-RH-1 EPIDEMIOLOGIC STUDY OF CHILD ABUSE--NATIONWIDE SURVEY

Purpose: To examine (1) incidence rates of child abuse in the U. S. population and in selected subsegments; (2) characteristics of individuals and families involved in child abuse; (3) circumstances surrounding and precipitating incidents of child abuse, including data on injuries; (4) patterns of health, welfare, and legal intervention measures, and their effects. For purposes of this study, child abuse is defined as "non-accidental physical attack or injury, from minimal to fatal injury, inflicted upon children by persons caring for them". (See Research Relating to Children, Bull. No. 19-RT-2.)
Methods: Every incident of child abuse reported in 1967 and 1968 throughout the U. S. in accordance with reporting legislation in all the states is channeled to the study through central registries set up during 1966 in each state. Standardized precoded instruments are used to describe each incident and the individuals involved. Every incident which occurred during 1967 in a representative sample of 38 cities and counties is subjected to a more intensive study and analysis by means of comprehensive, standardized, partially precoded research schedules. Prior to the 1967 and 1968 nationwide surveys a pilot study was conducted in California, and a nationwide public opinion survey explored knowledge about, and attitudes toward, physical abuse of children and the adults involved in such incidents.
Duration: July 1968-June 1969.
Investigator(s): David G. Gil, D.S.W., Associate Professor, Florence Heller Graduate School for Advanced Studies in Social Welfare, Brandeis University, Waltham, Mass. 02154.
Cooperating group(s): Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.
Publications: Findings of the California pilot study and of the public opinion survey published in 1967; report on 1967 survey in preparation, 1968.

23-RI-1 A STUDY OF AFDC RECIPIENTS IN TWO MISSISSIPPI COUNTIES

Purpose: To evaluate effects of certain program variables furnished to selected AFDC recipients; to do basic research in the area of mobility potential of AFDC recipients.
Subjects: 200 AFDC recipients residing in two Mississippi counties.
Methods: Subjects are interviewed and then randomly assigned to four groups, three experimental and one control. Experimental programs of financial support, medical, dental, and social services, work training and experience, and basic adult education are made available to the experimental groups. At the end of one year, respondents are reinterviewed to measure the varying effects of the program variables.
Duration: July 1967-June 1969.
Investigator(s): J. S. Wittman, Ph.D., Sociologist, Social Science Research Center, Mississippi State University, State College, Miss. 39762. (Reported by Peggy J. Ross, Assistant Sociologist, Social Science Research Center.)
Cooperating group(s): Mississippi Department of Public Welfare.
Publications: Several reports, articles, and theses planned.

23-RI-2 ACHIEVEMENT MOTIVATION IN WELFARE YOUTH

Purpose: To investigate patterns of achievement motivation in welfare youth; specifically, (1) to determine the relationship between length of time on public assistance and level of achievement motivation; (2) to compare AFDC youth with non-AFDC youth with respect to achievement motivation; (3) to define the characteristics of achievement motivation in youth from different cultural backgrounds.
Subjects: 525 adolescents, ages 14 to 16.
Methods: Subjects are divided into four AFDC groups classified according to length of time on public assistance, and one quasi-control group of nonwelfare youth. Each group contains 35 Mexican-Americans, 35 Negroes, and 35 Anglos. Achievement striving and achievement performance are studied with a battery of measures including inventory type data, level of aspiration indices, semiprojective and projective measures. Subjects are processed individually. Analysis of variance is used to test for systematic variations in achievement motivation responses in relation to length of time on public assistance and influence of cultural grouping.
Duration: Not reported-1970.
Investigator(s): Edmund V. Mech, Ph.D., Professor of Social Work, Graduate School of Social Service Administration, Arizona State University, Tempe, Ariz. 85281.
Cooperating group(s): Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.

23-RI-3 THE DISPOSITION OF SUSPECTED FRAUD CASES IN PUBLIC ASSISTANCE (AFDC)

Purpose: To investigate what happens to cases in which fraud is suspected; to assess the relationship of selected variables on the decision to prosecute suspected fraud cases; to obtain descriptive information on subjects.
Subjects: 81 AFDC cases which were referred by a public welfare department to the county's district attorney.
Methods: Retrospective analysis of case records.
Findings: Majority of cases are not prosecuted due to lack of court-admissible evidence; amount of money involved in suspected fraud is associated with decision to prosecute.
Duration: July 1967-January 1968.
Investigator(s): Paul Weinberger, D.S.W., Professor, San Diego State College School of Social Work, San Diego, Calif. 92115.
Cooperating group(s): San Francisco Department of Social Services; California State Department of Social Welfare.
Publications: Findings presented at National Conference on Social Welfare, San Francisco, May 1968. Publication pending.

HEALTH SERVICES

23-SD-1 STUDIES IN POSTNEONATAL MORTALITY IN NORTH CAROLINA

Purpose: To generate data upon which the Maternal and Child Health Section, State Board of Health, can develop new programs soundly directed toward the reduction of excess postneonatal mortality and morbidity in North Carolina; specifically, to determine those causes of postneonatal mortality which are amenable to intervention by health care.
Subjects: All mothers in North Carolina of children who died between the ages of 7 and 365 days during a period of one year; control group of mothers whose children have survived, matched on the basis of mother's age, race, birth weight of infant, age of infant, with the control group infant being born within one week of the study group infant, and geographic location in the state.
Methods: Interviews are held with the mothers of infants who have died and infants who have survived. No interview will be conducted sooner than 60 days after the death event.
Duration: July 1968-December 1969.
Investigator(s): Theodore D. Scurletis, M.D., Director, Personal Health Division, State Board of Health, Raleigh; Earl Siegel, M.D., Chairman, Department of Maternal and Child Health, and Bernard Greenberg, Ph.D., Chairman, Department of Biostatistics, School of Public Health, University of North Carolina, Chapel Hill, N. C. 27514.
Cooperating group(s): North Carolina Medical Society; North Carolina Pediatric Society.

23-SD-2 PRENATAL CARE PERSONNEL UTILIZATION PROJECT

Purpose: To design, implement, and evaluate the utility of a prenatal care program which seeks to make more efficient use of professional and nonprofessional clinic personnel with limited additional training in roles traditionally performed by more highly trained individuals.
Subjects: Population of a Maternity Care Research Clinic divided into experimental and control groups broadly matched by major variables.
Methods: Both groups are given care in accordance with presently accepted standards; control group receives care in the traditional manner and the study group in a manner modified to utilize professional and nonprofessional personnel most efficiently. Effects of traditional and modified programs of personnel utilization will be compared by health status of mother and infant; acceptance and utilization of care by the patient will be evaluated by her participation in the program and her expectations, perceptions, and degree of satisfaction; acceptance of their roles by clinic personnel will be determined by effectiveness of their performance and attitudes toward the clinic organization and patients. Functioning of the care systems will be evaluated by patient load, costs, efficiency and effectiveness of decisionmaking, and collection, processing, and transfer of information.
Duration: July 1968-June 1971.
Investigator(s): Edward R. Schlesinger, M.D., Professor of Maternal and Child Health, and Byron W. Wight, M.A., Assistant Research Professor of Maternal and Child Health, Graduate School of Public Health; Donald L.

Hutchinson, M.D., Professor of Obstetrics and Gynecology, and Willa D. Lowery, M.D., Assistant Research Professor of Obstetrics and Gynecology, University of Pittsburgh School of Medicine, Pittsburgh, Pa. 15213.
Cooperating group(s): Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.

23-SD-3 ANALYSIS OF PROGRAMS FOR PREGNANT ADOLESCENTS

Purpose: To analyze programs supported by the Children's Bureau serving adolescents who are pregnant out of wedlock.
Methods: Programs are being examined to identify the basis for measuring accomplishment, and the gaps in necessary data and current programming, and to make recommendations regarding both current and future programs supported by the Children's Bureau. Attention is focused on relating goals, service inputs, and administrative designs to outcome for both programs of prevention and programs of care for adolescents who are pregnant. A model will be developed to permit an evaluation of effectiveness if available information is found to be insufficient.
Duration: July 1968-continuing.
Investigator(s): John J. Dempsey, D.P.H., Assistant Professor, Division of Maternal and Child Health, Department of Population and Family Health, Johns Hopkins University School of Hygiene and Public Health, Baltimore, Md. 21205.
Cooperating group(s): Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.

23-SD-4 OPERATIONAL RESEARCH IN MATERNITY CARE OF ADOLESCENTS

Purpose: To investigate the efficiency and effectiveness of critical components of a maternity program for teenage girls at Magee-Womens Hospital.
Subjects: Teenage girls who have delivered at the Hospital.
Methods: Experimental design involves variation of characteristics of discussion and instructional groups in which subjects are enrolled. Two levels of exposure to program are achieved by terminating groups at either one or six months after delivery. Groups meet continously with either a medical or nonmedical leader, and visits within groups take place either once or twice a month. Effects of group treatment combinations will be measured in terms of objectives of the program including pregnancy outcome, postpartum health of mother and infant, avoidance of future pregnancies, adequacy of childcare practices, and continued patient education or vocational preparation. Experimental and outcome variable relationships will be controlled for background factors such as age, medical history, socioeconomic status, and family structure. Pre- and posttests will measure effects of group experience on changes in intervening variables of patient knowledge about and value attached to program objectives.
Duration: July 1968-June 1973.
Investigator(s): Edward R. Schlesinger, M.D., Professor of Maternal and Child Health, and Byron W. Wight, M.A., Assistant Research Professor of Maternal and Child Health, Graduate School of Public Health; Donald L. Hutchinson, M.D., Professor of Obstetrics and Gynecology, and Willa D. Lowery, M.D., Assistant Research Professor of Obstetrics and Gynecology, University of Pittsburgh School of Medicine, Pittsburgh, Pa. 15213.
Cooperating group(s): Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.

23-SD-5 STUDY OF PROGRAMS FOR UNWED TEENAGE MOTHERS

Purpose: To determine the impact of New Haven's Young Mothers Program, a hospital-based, comprehensive medical, social, and educational program for the teenage unwed mother, on the course of her pregnancy, and on the subsequent physical and psychological health and social development of both mother and child; specifically, to test hypotheses that (1) teenage unwed mothers who actively participate in the program will fare significantly better than similar girls enrolled in other prenatal care programs on a series of indicators including health during pregnancy, ease of labor and delivery, health in postpartum period, educational achievement, and familial and social relationships, and (2) infants of these mothers will be significantly healthier at birth and in the subsequent years, and will score significantly higher on indicators of physical and social development than will infants of similar mothers enrolled in other prenatal care programs.
Subjects: Pregnant teenagers participating in the Young Mothers Program at the Yale-New Haven Medical Center, contrasted with groups of pregnant teenagers receiving different patterns of care, primarily from interagency services for unwed mothers in Hartford.
Methods: A maximum of 60 girls is enrolled at one time, with intake continuing for two years. Girls are studied from registration through delivery and interviewed at 2, 13, and 24 months postpartum. Data are collected through clinical examination and observation of mothers and infants, social work interviews and observations, psychometric testing, home interviews, analysis of medical records,and review of records of other participating organizations. Characteristics of program participants which receive special attention include patterns of family living, incidence of mental subnormality, pregnancy among sisters in period preceding and following participant's pregnancy, interval between conceptions, feelings of alienation, and correlates of more or less active participation. Characteristics of program-eligible patients who decide not to participate in the program will also be studied.
Duration: July 1967-December 1972.
Investigator(s): James F. Jekel, M.D., Assistant Professor of Public Health, and C. Lee Buxton, M.D., Professor of Obstetrics and Gynecology, Department of Public Health, Yale University School of Medicine, New Haven, Conn. 06510. (Reported by Lorraine V. Klerman, D.P.H., Department of Public Health.)
Cooperating group(s): New Haven Board of Education; Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.
Publications: *Health Education Monographs*, 1968; *American Journal of Public Health* 57:1308-1313, August 1967; *American Journal of Obstetrics and Gynecology*, forthcoming.

23-SD-6 DEVELOPMENT OF A COMMUNITYWIDE HEALTH INFORMATION SYSTEM TO ASSIST IN MATERNAL AND CHILD HEALTH PROGRAM PLANNING

Purpose: To determine the feasibility and cost of an ongoing health information system for homogeneous urban neighborhoods at different living levels, composed of geographic units smaller than census tracts.
Methods: Methodology is being explored and techniques developed for merging census small-area data with information from public health records, hospital obstetrical records, and supplementary health surveys. Standardized computer programs will be designed for tabulating, charting, and mapping data, and guidelines developed for use by other communities for relating local health data to small-area census data in 1970. These programs will be useful to administrators in their comprehensive health

planning for mothers, children, and their families in cities and SMSA's throughout the country.
Duration: July 1967-June 1969.
Investigator(s): Estelle Siker, M.D., Acting Director, Community Health Division, State Department of Health, Hartford, Conn. 06115.
Cooperating group(s): Census Bureau, U. S. Department of Commerce; Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.

23-SE-1 FAMILY PLANNING: CLINIC AND COST EVALUATION

Purpose: To provide information to administrators about the activities of family planning services and also, the relationships between resources devoted to family planning and the resulting outcomes.
Methods: Field studies are being conducted in about 50 cities in the United States. Initial phase involves research in both time/motion studies of procedures in family planning clinics and costs of the resources used.
Duration: July 1968-June 1969.
Investigator(s): Charles R. Dean, Ph.D., Acting Research Director, Joy G. Dryfoos, George Varky, and Cornelia Van Vleck, Planned Parenthood Federation of America, Inc., 515 Madison Ave., New York, N. Y. 10022.
Cooperating group(s): Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.

23-SE-2 FAMILY PLANNING APPROACHES AMONG "HIGH RISK" FEMALES

Purpose: To evaluate various programmatic approaches to increasing and maintaining the proportion of females in a high risk group who become effectual and consistent in practicing family planning over a period of three to five years as a primary prevention of various illnesses and physical impairments.
Subjects: 6,500 poverty-level Negro females of childbearing ages.
Methods: Baseline data, including 1,400 items of information on a 1-in-10 sample from this population, are to be used in ascertaining which educational methods and clinic procedures are most effective in overcoming resistance to family planning, and in translating availability and accessibility of health services into the life styles and time patterns of the high risk population.
Duration: July 1968-June 1971.
Investigator(s): Clark E. Vincent, Ph.D., Director, Frank R. Lock, M.D., Medical Director, and Carl M. Cochrane, Ph.D., Professor of Psychology, Behavioral Sciences Center; and Fleetus Gobble, M.D., Assistant Professor of Obstetrics and Gynecology, Bowman Gray School of Medicine, Wake Forest University, Winston-Salem, N. C. 27103.
Cooperating group(s): Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.

23-SF-1 PATTERNS OF FAMILY FOLLOWUP

Purpose: To determine needs of children and their families served by a mental retardation clinic and to evaluate the effects of the clinic program.
Subjects: 100 mentally retarded children and their families served by the University of Virginia mental retardation clinic in Charlottesville, Va.

Methods: The diagnostic and followup process is assessed in terms of the families' problems and their experiences with the program. A structured precoded interview form documents family identification and circumstances, parental occupation and income, child's school experience, source of referral, family responses in terms of problems which concerned the family as contrasted with those presented to the clinic diagnostically, age of the child when problems were first noted and as contrasted to age of referral, help wanted and received, personnel parents thought were most helpful, and needs which remained after clinic evaluation and management. The followup interview form was completed 6 to 12 months after the initial interview of the clinic had been initiated.
Findings: The great majority of families received satisfactory services but reported many unmet needs. The importance of considering the families' presenting problems as a focal point of diagnosis and continuing management in counseling was demonstrated. Family characteristics of social class, source of referral and presenting problems were closely related to the families' expressed needs. The specific nature of severity of the child's mental retardation was less closely related to these needs. The importance of continuing diagnostic-therapeutic evaluation was emphasized.
Duration: 1966-continuing.
Investigator(s): Roger J. Meyer, M.D., M.P.H., Associate Professor of Pediatrics, Richard L. Stafford, Ph.D., Assistant Professor of Pediatrics, and Milton D. Jacobson, Ph.D., Assistant Professor of Educational Research, University of Virginia, Charlottesville, Va. 22901.
Cooperating group(s): Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.
Publications: Several articles submitted for publication.

23-SF-2 A STUDY OF ADOLESCENT HEALTH IN HARLEM

Purpose: To obtain data on the physical and emotional health status of young adolescents in Harlem, to determine their medical care needs, and to contribute to more effective planning and delivery of health services for adolescents in such communities.
Subjects: Approximately 400 adolescents, ages 12 to 15, in a sample of households in a larger community health survey now being conducted in Harlem by Columbia University School of Public Health and Administrative Medicine.
Methods: Written consent by parents cooperating in the larger survey will be requested to conduct interviews at home and medical examinations at Harlem Hospital. The interviews will deal with attitudes and behavior relating to health; the examinations will be comparable to those being done in the nationwide U.S. Health Examination Survey of a somewhat older age group. Efforts will be made to ensure that the adolescents requiring further medical attention will get it; efforts will also be made to follow up on each case recommended for medical care in order to provide some accounting of its effectiveness.
Findings: Preliminary results suggest that a large proportion of adolescents examined have minor physical conditions amenable to treatment which had not previously been sought.
Duration: August 1968-July 1970.
Investigator(s): Eric Josephson, Ph.D., Assistant Professor, and Ann F. Brunswick, M.A., Research Associate, Division of Sociomedical Sciences, Columbia University School of Public Health and Administrative Medicine, New York, N. Y. 10032.
Cooperating group(s): Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare.
Publications: Publications planned.

23-SG-1 EMOTIONAL HEALTH OF CHILDREN IN THE FAMILY SETTING

Purpose: To obtain an estimate of the emotional health of children in Westchester County, N. Y., as a basis for mental health planning, and to examine parental attitudes toward professional help; to develop an instrument for identifying emotionally impaired children which can be used in other communities; to explore the relationship of the emotional health or impairment of children to a number of demographic and psychological characteristics of the family setting.
Subjects: A random stratified sample of 800 children, ages 3 to 18, selected from six representative areas in Westchester, urban, suburban and rural.
Methods: Mothers were interviewed in their homes, on the basis of an extensive semistructured questionnaire. Supplementary information was obtained from school records. Data collected on the study child were evaluated by one of the 11 participating psychiatrists, who rated the emotional health of the child and the family setting, in line with procedures developed and tested in a series of training workshops. All data are prepared for processing by computer and for statistical analysis.
Duration: June 1966-August 1969.
Investigator(s): Olga Rubinow Lurie, Ph.D., Project Director, Esther D. Wallach, Executive Director, and Laura Jensen, M.A., Research Assistant, Mental Health Association of Westchester County, 29 Sterling Ave., White Plains, N. Y. 10606.
Cooperating group(s): Westchester County public and parochial schools; Westchester County Planning Department and public agencies; National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.
Publications: Publication is planned as findings become available.

23-SG-2 COMPREHENSIVE MENTAL HEALTH SERVICE

Purpose: To establish a comprehensive mental health service program which will provide early identification, referral, and treatment for students with emotional problems; to establish a prevention and education program.
Subjects: Children in kindergarten through grade six, teachers, administrators, and parents.
Methods: School staff members are trained to understand the elements essential to promoting a favorable mental health climate in the classroom and to recognize when behavioral and emotional problems should be referred to the mental health service. Parents are assisted in dealing with such problems in the home environment. A prevention program seeks to eliminate some of the causes of emotional problems. Teachers participate in inservice programs and meet with consultants from the Nebraska Psychiatric Institute.
Duration: July 1966-June 1969.
Investigator(s): Kenneth D. Orton, Ph.D., and David Levine, Ph.D., Professors, Department of Educational Psychology and Measurements, University of Nebraska, Lincoln, Neb. 68505. (Reported by Martin Koolen, Coordinator, Mental Health Service, 7801 Cass St., Omaha, Neb. 68114.)
Publications: Publication planned in 1969.

23-SG-3 CAREER MOTIVATION STUDY AND RECRUITMENT PROJECT

Purpose: To test and evaluate several methods of motivating or interesting high school students in mental health and related careers; to identify,

test, and evaluate significant factors or key methods that influence students or play an important role in the career decisions or vocational choices of youth.
Subjects: High school sophomores.
Methods: Project is geared toward interesting high school youth in mental health careers at an early point in their educational process when career decisions or vocational choices have not been firmly crystallized. School guidance directors, counselors, faculty members, community leaders, and other individuals and organizations who play an important role in assisting students in their career decision processes are utilized, along with mental health personnel. Project promotes interest in vocations of the mental health field which do not require education or formal training as well as those which do. Such devices as career information, field trips, work experience, program observation, volunteer work, school club organization, community service club participation, etc. are utilized.
Duration: 1965-1971.
Investigator(s): William J. McGlothlin, Vice President, University of Louisville; Earl E. Staton, Executive Director, Anna E. Barker, Research Statistician, and Claude B. Tiller, Education Program Coordinator, Kentucky Mental Health Manpower Commission, P. O. Box 22234, Louisville, Ky. 40222.
Cooperating group(s): National Institute of Mental Health, Public Health Service, U. S. Department of Health, Education, and Welfare.

SUBJECTS

Note: This index uses only those terms used by the investigators in their abstracts. For example, if an investigator does not show that his preschool study is a Head Start project, that study will not be indexed under "Head Start project".

- Accidents 23-GA-3
- Adaptability training 23-HJ-6
- Administrative aspects
  - agency relationships 23-QG-1
  - cost 23-HJ-4, 23-RA-1, 23-RF-1, 23-RF-2, 23-SD-2, 23-SD-6, 23-SE-1
  - evaluation of child care services 23-RA-1
  - foster care placement 23-RE-1
  - merging of agencies 23-RB-3
  - organizational problems 23-QG-1
  - personnel 23-JI-2, 23-RB-2
  - staff training 23-KS-7, 23-RF-2
  - unmarried mothers' programs 23-SD-3
- Adolescence
  - adjustment 23-BA-1
  - Aid to Families with Dependent Children 23-RI-2
  - civil disturbances 23-NC-2
  - civil rights 23-NC-1
  - delinquency 23-KC-1--KJ-1, 23-KK-2--KS-7
  - drug abuse 23-JC-1
  - emotional disturbance 23-HJ-1, 23-JA-1, 23-JB-2--JC-1, 23-JF-1, 23-JH-1, 23-JI-1, 23-JI-3--6, 23-SG-1
  - employment 23-NB-2
  - family relations 23-LA-2
  - growth and development 23-AA-4, 23-AA-7, 23-AA-10
  - health services 23-SF-2
  - integration 23-OK-6
  - interpersonal perception 23-FA-3
  - maternal and child health services 23-SD-4
  - mental retardation 23-HC-1, 23-HC-3, 23-HI-2--HJ-3
  - motivation 23-LD-2, 23-RI-2
  - physical handicaps 23-GA-2, 23-GD-2, 23-GE-3
  - social system 23-KK-2
  - special education 23-JI-5, 23-QE-14
  - status characteristics 23-NF-2
  - underachievement 23-OF-5
  - unemployment 23-NB-1
- Adolescence (cont'd.)
  - unmarried mothers 23-KA-1, 23-QH-3, 23-SD-3--5
  - vocational attitudes 23-LD-2, 23-NB-2, 23-SG-3
  - work-study programs 23-QG-1, 23-QG-2
- Adoption 23-JF-3, 23-LH-1, 23-LH-2, 23-RD-1
- Aftercare 23-KD-3
- Aggression 23-EA-2
- Aid to Families with Dependent Children 23-RI-1--3
- Alcoholism 23-LF-2
- American-Indian children 23-NG-2
- Anglo-American children 23-OK-3, 23-QE-1, 23-RI-2
- Anxiety 23-DA-1, 23-JH-3
- Aphasia 23-GC-4
- Aspiration level 23-DA-1, 23-HI-2, 23-JD-1, 23-NA-1, 23-QE-14. See also Values.
- Assassination of Robert F. Kennedy 23-JA-2
- Asthma 23-GC-1, 23-JD-1
- Attitudes
  - of adults
    - toward
      - disabled children 23-GF-1
  - of children and youth
    - general 23-OA-1
    - toward

RESEARCH NOTES

CENTER FOR RESEARCH AND ADVANCED TRAINING IN DEAFNESS REHABILITATION

The Center for Research and Advanced Training in Deafness Rehabilitation was initiated at New York University under the sponsorship of the Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare. The Center's program is organized around three main branches: Training, Research, and Consultation. In research, the major concern is with the field of human communication, programmatically designed for integrated studies of the multiple aspects of communication.

CHILD CARE INFORMATION CENTER

The Presbyterian Institute for Human Development, Inc. has established the Child Care Information Center. The Center will be concerned with the group care of children. Further information is available from Mr. George Perkins, Director of the Institute, Box 23309, Anchorage, Ky. 40223.

NATIONAL LABORATORY IN EARLY CHILDHOOD EDUCATION

The Office of Education, U. S. Department of Health, Education, and Welfare, has established a National Laboratory in Early Childhood Education, under which centers have been set up at seven colleges and universities. These centers will represent a diversity of philosophies and approaches to early childhood education. Research and development activities of the Laboratory will be coordinated by the Center at the University of Illinois (which is also one of the eighteen ERIC Clearinghouses referred to on the following page). Information on the National Laboratory may be obtained from Dr. James O. Miller, Director, National Coordination Center, 805 West Pennsylvania Ave., Urbana, Ill. 61801.

Psychological Abstracts, American Psychological Association, 1333 - 16th St., N. W., Washington, D. C. 20036.

Rehabilitation Literature, National Easter Seal Society for Crippled Children and Adults, 2023 W. Ogden Ave., Chicago, Ill. 60612.

Research and Study Projects Reported by FSAA Member Agencies, Family Service Association of America, 44 E. 23rd St., New York, N. Y. 10010.

Sociological Abstracts, Leo P. Chall, 15 E. 31st St., New York, N. Y. 10016.

Through the Educational Resources Information Center (formerly the Educational Research Information Center), better known as ERIC, current research and research-related information will be made available to teachers, administrators, researchers, commercial organizations, and others. ERIC also includes eighteen clearinghouses, or documentation centers, located at universities and other institutions throughout the country. Each clearinghouse will concentrate on a different subject-matter area. More complete information may be obtained by writing to the Director of ERIC, Office of Education, U. S. Department of Health, Education, and Welfare, Washington, D. C. 20202.

The Excerpta Medica Foundation, New York Academy of Medicine Building, 2 E. 103rd St., New York, N. Y. 10029, and 119-123 Herengracht, Amsterdam C, The Netherlands, has established an abstracting service on pediatrics on a yearly subscription basis. In addition to abstracts, the Foundation can provide to subscribers, at cost, photocopies and translations of complete articles.

The Human Relations Area Files have classified cultural data on primitive and non-primitive societies into 710 categories of human behavior. Complete sets of all files are available in 22 member institutions in the United States. For information, write to Dr. Clellan S. Ford, President, Human Relations Area Files, Yale University, New Haven, Conn. 06520.

The Minnesota Family Study Center can supply to interested scholars bibliographic information from the Inventory of Published Research in Marriage and Family Behavior. Requests for information should be addressed to the Director, Inventory of Published Research in Marriage and Family Behavior, Social Science Tower 1026, University of Minnesota, Minneapolis, Minn. 55455.

The Library of the National Easter Seal Society for Crippled Children and Adults has initiated a photoduplication service for persons engaged in rehabilitation research. It is available without charge to personnel in educational or research institutions and health or welfare agencies, public or private. This service hopes to provide the necessary professional literature not available in local libraries. Further information may be obtained by writing to the Librarian of the Society, 2023 W. Ogden Ave., Chicago, Ill. 60612.

The Science Information Exchange, Smithsonian Institution, 209 Madison National Bank Bldg., 1730 M St., N. W., Washington, D. C. 20036, provides to qualified investigators, on request, selected abstracts of current research supported by foundation or government grants. The Exchange covers such fields as medicine, nursing, public health, nutrition, psychology, education, anthropology, mental health, and intercultural relations.

The World Federation for Mental Health, 19 Manchester St., London W.1, England, operates a clearinghouse for research and study projects in the field of mental health.

The Library of the National Bureau for Child Welfare (Voor Kinderbescherming), Stadhouderslaan 150, The Hague, publishes abstracts of articles in the field of child welfare each month. These are in Dutch, but those familiar with the Universal Decimal System would be able to understand something about the article. The subscription rate for documentation on cards is 30 guilders (approximately $8.40).

In addition to these journals and services, many professional journals in such fields as pediatrics and mental deficiency include a section of abstracts regularly or once a year. There are also a number of indexes and abstracting journals in the medical area which occasionally refer to materials in the area of child development.

CHILDREN'S BUREAU
CLEARINGHOUSE FOR RESEARCH IN CHILD LIFE
WASHINGTON, D C. 20201

If you are currently engaged in research on children or their families, we would appreciate your cooperation in providing a short summary of your work for inclusion in the next issue of *Research Relating to Children.*

The Clearinghouse is the branch of the Children's Bureau which collects and disseminates information on current research relating to children and their families. Its purpose is to make such information available to research investigators and others concerned with research in child life.

The instructions on the third page of this form will serve as a guide for your summary. You will, of course, receive a free copy of the issue in which your study appears.

If you know of others doing research which might be of interest to the Clearinghouse, please give name(s) and address(es) below:

____

____

Thank you for your cooperation.

INSTRUCTIONS

Please report studies in progress (or recently completed) which:

center on children or their families in such areas as child growth and development, intelligence, personality, education, social adjustment, family life, physical and emotional disorders, etc.

concern service programs in the fields of child health, child welfare, or special education

Please *DO NOT* report:

studies already reported to the Clearinghouse

purely medical studies limited to morphology or physiology, the physical aspects of etiology, epidemiology or symptomatology of diseases or handicapping conditions, surgery, chemotherapy, antibiotics or physical therapy; biochemical or other laboratory studies; animal studies

educational studies of curriculum construction or materials, teaching methods, surveys of school facilities or needs, general school administration studies

studies already published in sources generally available in major libraries across the country

demonstration projects, unless there is a formal plan for evaluation

studies of test development, standardization, or validation, except for special groups of children such as blind or retarded

regularly collected material such as annual reports, work preparatory to writing handbooks; directories; research based on secondary sources

master's theses, unless they represent work beyond a doctorate, as in dentistry

THE CHILDREN'S BUREAU
AND ITS
CLEARINGHOUSE FOR RESEARCH IN CHILD LIFE . . . .

The Children's Bureau was established in 1912 to "investigate and report. . . . upon all matters pertaining to the welfare of children and child life among all classes of our people." From this beginning, the Bureau has extended its activities into such areas as developing standards of care for children and providing funds to States to improve conditions for children. More recently, the Bureau has established several new grants programs to support research in areas of maternal and child health and child welfare.

In keeping with the basic Act establishing the Bureau, the Clearinghouse for Research in Child Life was set up in 1948. Its function is to collect information about current research relating to children in order to make such information available for the use of investigators, administrators, program planners, and practitioners.

Investigators reporting a study to the Clearinghouse receive a free copy of the issue of *Research Relating to Children* in which their study appears. A free copy of each issue is also sent to directors of research centers and to libraries. In addition, the Clearinghouse maintains a mailing list of interested persons who receive announcements of new issues as they are published. Individuals may purchase copies from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

The Children's Bureau Clearinghouse routinely exchanges information with the Science Information Exchange of the Smithsonian Institution. This organization is very helpful in providing abstracts of research supported by federal funds and by many foundations. The major source of information, however, is the individual research investigator, whose help is essential in obtaining the most complete and up-to-date coverage possible.

CLEARINGHOUSE PUBLICATIONS

Bibliography on the Battered Child, May 1966. Copies free from the Clearinghouse, Children's Bureau, Social and Rehabilitation Service, U. S. Department of Health, Education, and Welfare, Washington, D. C. 20201.

Research Relating to Emotionally Disturbed Children, 1968. A listing of studies reported to the Clearinghouse between 1956 and 1967, including publication references. Single copies free from the Clearinghouse; also available directly from the Government Printing Office for $1.00.

Research Relating to Juvenile Delinquents, 1962 (reprinted 1966). A listing of studies reported to the Clearinghouse between 1948-1961, including publication references. Single copies free from the Clearinghouse; also available directly from the Government Printing Office, Washington, D. C. 20402, for 35 cents. Do not send money to the Clearinghouse.

Research Relating to Mentally Retarded Children, 1966. A listing of studies reported to the Clearinghouse between 1948-1965, including publication references. Single copies free from the Clearinghouse; also available directly from the Government Printing Office for 65 cents. Do not send money to the Clearinghouse.

Research Relating to Children.* An inventory of abstracts of ongoing or recently completed research studies published once or twice a year. Single copies of the following issue are available without charge from the Clearinghouse. (Dates indicate period during which studies were reported to us.)

Bulletin II, Supplement 4 (February-November 1955)

The following issues are available for purchase directly from the Government Printing Office, at the prices indicated. Do not send money to the Clearinghouse.

Bulletin 18 (March-December 1964) - $1.25
Bulletin 19 (January-September 1965) - $1.50
Bulletin 20 (October 1965-May 1966) - $1.25
Bulletin 21 (June 1966-April 1967) - $1.25
Bulletin 22 (May-December 1967) - $1.00

All issues not listed above are OUT OF PRINT but are available in many libraries.

*An investigator receives a free copy of the issue of Research Relating to Children in which his study appears. A free copy of each issue is available to libraries and research centers. The Clearinghouse also maintains a mailing list of interested persons who receive announcements of new issues as they are published.
